BIOGRAPHY.

The names of those living at the time of the continuous publication of the 'English Cyclopædia of Biography,' are preceded by an asterisk.

CABALLERO, FERMIN.

* **CABALLERO, FERMIN**, a Spanish author, journalist, and statesman, was born in 1800, of poor labouring parents, who exerted themselves to procure him a superior education. He showed very early a predilection for geographical studies, and at the age of fourteen had produced a plan of his native town, Barajas de Melo, in the province of Cuenca. The first work that brought him into notice was a series of criticisms on Miñano's 'Geographical Dictionary of the Peninsula,' a work of great extent (10 vols. 4to), and of apparent value, but in reality compiled with inexcusable carelessness. Miñano was an especial favourite with King Ferdinand VII.; and his book, though expensive, was subscribed for, however unwillingly, by every person who held an official post throughout the kingdom. The attacks of Caballero, which began in 1829 and extended to as many pamphlets as Miñano's 'Dictionary' counted volumes, were as witty as they were just, and were productive of unexpected benefit to their author. The minister Calomarde, who was undoubtedly jealous of the influence of Miñano over the king, bestowed substantial favours on his antagonist; and Caballero, who had hitherto been an obscure lawyer, was soon known in the character of a landed proprietor. It may be observed, that Miñano's work is now completely superseded by Madoz's 'Diccionario de España,' in 16 closely-printed volumes—a treasure of topographical information and research, which would do honour to any country in Europe. In 1833 Caballero set on foot a journal of note, the 'Boletín de Comercio,' and when that was suppressed by the minister Burgos, followed it up with the 'Eco del Comercio,' which, chiefly owing to the talent of his leading articles, became and continued one of the most influential journals in Spain. After the peaceful revolution produced by the 'Estatuto Real,' he was elected to the Cortes by the town of Cuenca, and was known as one of its most decidedly radical members. While the contest between Carlos and Christina was still doubtful, he voted that Carlos should be put to death if taken; and he afterwards voted that Christina should be deprived of the guardianship of her children. On the accession of his friend Lopez to the ministry, in 1843, he formed one of the cabinet, was expelled with Lopez by Espartero, and again resumed office on Espartero's fall. His tenure of it on the second occasion was but short, and his activity has since been mainly of a literary kind. His reputation was materially injured by the publication of a work entitled 'Commentaries on Anquetil,' the French historian, in which, to the astonishment of the public, the principles of absolutism were avowed and defended. In reply to the attacks upon him, Caballero made the singular defence, that though the book was published in his name the objectionable passages had been inserted without his consent by an old academicien connected with the censorship, Don Pedro Maria Olive. The friends of Olive indignantly denied the charge, and the matter appears never to have been satisfactorily cleared up. His other works are almost entirely of a geographical character. The two most important are, a quarto volume entitled 'Manual geografico administrativo de España,' a work of great and varied information, and a small pamphlet on the 'Geographical Learning of Cervantes,' which will supply some valuable notes to future editors of 'Don Quixote.'

CABANIS, PIERRE JEAN GEORGE, a distinguished physician and philosopher, the son of Jean Baptiste Cabanis, an able agriculturist, was born at Conac in 1757. His natural disposition appears to have been somewhat violent, and the earlier period of his youth was passed in continual struggles against the severity of the treatment

CABET, ETIENNE.

which he seems to have received both from his father and his teachers. During a short interval, in which he was under the care of a kind and judicious instructor, he indicated a decided taste for classical literature; but being soon removed from a teacher who saw and endeavoured to develop his latent talents, and being again subjected to harshness, he lapsed into such a state of idleness and obstinacy, that at the age of fourteen his father in absolute despair sent him alone to Paris, where, feeling he had no sort of influence over him, he abandoned him to his own course. The moment he felt himself free, this youth, hitherto so indolent and intractable, became a diligent student, and for the space of two years devoted himself with an intensity which has been rarely exceeded to the study not only of the Greek, Latin, and French classics, but also of the works of the metaphysical writers both of England and France. His love of poetry was ardent, and he soon acquired no inconsiderable celebrity for some poetical pieces of his own; but seeing nothing cheering in the prospect of the pursuit of literature as a profession, he chose the study of medicine, chiefly, as he himself states, on account of the varied sciences to which it obliged him to direct his attention. Under the guidance of a friend, an able physician, he applied himself for six years to the study of medicine with so much intensity that his health began to fail him, and being on this account obliged to leave Paris, he went to reside at Auteuil, where he became acquainted with the widow of Helvetius. This acquaintance determined the character of his future life. At the house of this lady, who in a manner adopted him as her son, he became intimate with the most celebrated men of that age, Turgot, D'Holbach, Franklin, Jefferson, Condillac, and Thomas. Here too he lived familiarly for many years with Diderot and D'Alembert, and occasionally saw Voltaire. He appears to have formed a strong attachment to Mirabeau, for which he was exposed to no little obloquy; he was the chosen friend of Condorcet, and he had the gratification of being able to soothe the last moments of both these remarkable men. He married Charlotte Grouchy, sister of General Grouchy and of Madame Condorcet, with whom he lived happily until his death, which happened somewhat suddenly on the 5th of May 1808, in the fifty-second year of his age. He had borne no inconsiderable part in the events of the revolution; was one of the Council of Five Hundred, and afterwards a member of the senate. He was the author of several works of great celebrity in his day; but that which has given to his name a permanent distinction is his treatise on the relation between the physical and moral nature of man. This work, entitled 'Rapports du Physique et du Moral de l'Homme,' is partly metaphysical and partly physiological, and displays no ordinary power of observation and analysis. It is remarkable too as being the first attempt to treat, in a systematic form, the interesting but difficult subject which it investigates. This work may still be read with interest and instruction by the physician and metaphysician, and the practical educator.

* **CABET, ETIENNE**, leader of the French Communists, or Icaris, was born at Dijon, January 2, 1788. His father, a cooper in that city, gave him a liberal education; in due time he was admitted a member of the bar; and he appears to have early acquired some practice. In 1816 he defended General Veaux, who, with several others, was tried for conspiring against the restored Bourbons; and Cabet's ardour on that occasion drew down upon him so large a measure of official displeasure, that he found it necessary shortly after to quit Dijon. At Paris M. Cabet, failing to obtain distinction in his

profession, turned to literature for support as well as fame. For some years he conducted the 'Journal de Jurisprudence.' His advocacy of liberal views had brought him into connection with some of the more active promoters of the revolution of 1830, and shortly after that event he was appointed procureur-general for Corsica. But he was dissatisfied with the constitution of July as not sufficiently democratic, and he for some time delayed to depart for the scene of his new duties. At length when he was compelled to go, his first act on arriving at Bastia was to deliver an official address, in which he denounced the new charter, and pointed out in detail its deficiencies. This of course could not be tolerated, and M. Cabet was summarily recalled. He at once threw himself into the ranks of the opposition. Chosen by one of the electoral colleges of Dijon, he made himself conspicuous in the Chamber of Deputies by the violence of his harangues, and at the same time he published several pamphlets, and established a newspaper 'Le Populaire' of ultra-democratic tendencies. For certain strictures on the king he was, in February 1834, prosecuted, and being found guilty was condemned to two years' imprisonment and a heavy penalty. He however escaped to England, where he remained till the amnesty of 1839 permitted him to return to Paris; soon after which he published a 'Histoire de la Révolution de 1789,' the fruit of his labour while in exile, but it gained him no reputation, and was soon forgotten.

He now began to put forward his peculiar doctrines. The first direct publication of them appears to have been in 1841, in 'Letters from a Communist to a Reformer.' But a more formal enunciation of them appeared in his 'Voyage en Icarie,' published in 1842, in which under the figure of a utopian republic he developed his views of a socialist colony. The book at once attracted the notice of a large number of the working classes of Paris already strongly imbued with socialist opinions. In his scheme he had provided a complete code for the moral and physical as well as the political governance of the community, and he soon found disciples ready to place themselves under his direction. He made a journey to London in 1847 in order to obtain the grant of a large tract of country in Texas, and having announced his success, the first party of his followers departed for the land of promise, as Cabet afterwards declared against his advice, and without any knowledge of the country or of the nature of the difficulties they would have to encounter. They reached their destination, but intelligence quickly arrived in Paris that they were suffering the most terrible privations. A great outcry was raised against Cabet, but the faith of his disciples was not shaken, and another band was soon found to follow in the track of the pioneers. Cabet himself set out at the end of the year to join his disciples. He found them divided into two parties. The larger section adhered to him, and announced their readiness to proceed with him in search of a more suitable home. The Mormons had some time before been expelled from their city of Nauvoo, and Cabet in his journey through the United States had learnt that there was a city finely situated on the Mississippi but now lying deserted, already provided to his hand, and that he would find little difficulty in obtaining permission to occupy it. In May 1850 Cabet with his Icarians was established in Nauvoo. He was not destined as yet however to rest there. During his absence from Paris a process had been commenced against him for having obtained money under false pretences from his followers, and having of course failed to put in a defence he was condemned, September 1849, in contumacy, to two years' imprisonment. The news of this sentence produced some commotion at Nauvoo, but the opposition was suppressed, and a vote passed of confidence in the honour and probity of their leader. Cabet almost immediately returned to Paris, and, notwithstanding the vast amount of prejudice he found existing against himself, remitted his case to the Court of Appeal, and after a trial which lasted three days his former sentence was reversed.

M. Cabet shortly after the trial returned to Nauvoo, where he has since continued, the sole judge and ruler of his little band. The most recent accounts we have seen represent the Icarians as living in apparent harmony, having a community of goods, and possessing under Cabet something like equality,—a social despotism in fact. But the number of the community appears to be steadily decreasing: it now probably scarcely exceeds 200.

(*Nouvelle Biographie Universelle; Gazetteers of the United States, &c.*)

CABOCHE, SIMONET, was the principal leader in Paris of a redoubtable band attached to the faction of Jean Sans-Peur, duke of Burgundy. Charles VI., king of France, had become insane about the year 1393, and the kingdom during the remainder of his disastrous reign was harassed by the rival factions of the Armagnacs, who were led by the Count of Armagnac and the Duke of Orléans (the king's brother), and the Bourgognians (Burgundians), who were the followers of the Duke of Burgundy. The butchers of Paris were at that period a corporate body, having a monopoly of the supply of meat for the city, and were consequently possessed of property, power, and influence. Caboché was at the head of that division of the trade who were called Ecorcheurs (Skinners), and his party, named after him Cabochiens, and sometimes Ecorcheurs, in number about 500, and armed with their formidable knives, became notorious for their violence and ferocity. Their reign of terror seems to have commenced about 1412, and to have terminated about 1414, when the main body of the citizens of Paris, incensed by their exactions and massacres,

took arms in their own defence, and placing the Dauphin at their head, overpowered the Cabochiens, and restored the tranquillity of the city. After the death of the Dauphin the Ecorcheurs appeared again on the scene, in the reign of Charles VII., but were then headed by a ruffian named Capeluche. What had become of Caboché is not known.

CABOT, SEBASTIAN, was the son of John Cabot or Gabotto, a native of Venice, who resided occasionally in England, and of whom little more is known than that he was a wealthy, intelligent merchant, and fond of maritime discovery. Sebastian was born at Bristol about 1477, and was early instructed in geography, navigation, and mathematics. When only 19 years of age, he was included with his two brothers in a patent, dated 5th of March, 1496, granted by Henry VII. to John Cabot his father, for the discovery and conquest of unknown lands. About a year after the date of the patent, Sebastian Cabot sailed (apparently with his father) in a ship equipped at Bristol, named the Matthew, and on the 24th of June he first saw North America, probably the coast of Labrador, about lat. 56°. It has generally been stated that this first-discovered land was Newfoundland, and that it was named by Cabot, Prima Vista; but it appears that the cause of the error was a mistranslation by Hakluyt of a document in Latin appended to a map of America drawn by Cabot himself. The description given in that document cannot possibly refer to Newfoundland, but may apply very well to the coast of Labrador. We have no account of this voyage further than the discovery itself, but it appears probable that Cabot returned to England immediately; an opinion which receives some support from an entry in the privy purse expenses of Henry VII.,—"10th August 1497 To hym that found the new Isle 104." This is still further confirmed by the patent of 3rd of February 1498, granting to John Kabotto permission to take six ships in any haven of the realm, of the burden of 200 tons and under, "to convey and lede to the Londe and Isles of late founde by the said John in oure name and by our commaundement," &c. It is difficult to assign to each of the Cabots (a father and three sons) his exact part in these discoveries, but Sebastian seems always to have been considered the most scientific navigator of the family. Another voyage was made by Cabot, according to the terms of this patent, but we have no details as to its results; and a third voyage appears to have been made to the Gulf of Mexico in 1499. About this time it is supposed that John Cabot died, but there is no record of his death, nor is anything whatever known of Sebastian Cabot for the next twelve years. Soon after the death of Henry VII. Cabot was sent for by Ferdinand king of Spain, in which country he arrived in September 1512, and immediately received the title of Captain, with a liberal salary. It appears from Spanish authorities, that Cabot was disgusted with the want of consideration shown him in England. No specific duties appear to have been at first assigned to Cabot in Spain; but we find him in 1515 connected with a general revision of maps and charts, and holding the dignified station of member of the council of the Indies. He was also appointed to conduct an important expedition for new discoveries towards the west; but the death of Ferdinand, in the beginning of 1516, prevented the accomplishment of the plan. The new king of Spain, Charles V., was occupied elsewhere, and did not reach Spain for some time, during which the court was a scene of shameless intrigue. Fonseca, the enemy of Columbus, was in authority, and the alights he and his creatures put upon Cabot caused the latter to return to England. In 1517 Cabot was employed by Henry VIII., in connection with Sir Thomas Perte, to make another attempt at a north-west passage. On this voyage he reached lat. 67½°, and it must have been on this occasion that he entered Hudson's Bay, "and gave English names to sundry places therein." But of this, like all the rest of Cabot's discoveries, no details have been preserved, and even the whole voyage has been referred to the south instead of the north. It is only known that the malice or timidity of Sir Thomas Perte, and the mutinous conduct of his crew, compelled him to return. After this voyage Cabot again visited Spain, where he was named by Charles V. Pilot Major of the kingdom, and intrusted with the duty of critically examining all projects of voyages of discovery. At this time the views of adventurers were chiefly directed to the south, and the Molucca Islands were pointed out as a valuable field for enterprise. Portugal having earnestly represented that the limits assigned to her by the pope in his division of the New World would include the Moluccas, it was resolved that a solemn conference should take place, in which all parties should state their claims, and experienced men should attend for the purpose of reference. Cabot is at the head of this list, in which we also find Ferdinand and Columbus, son of the great Columbus. The conference was held at Badajoz, in April 1524, and by the end of May sentence was pronounced that the Moluccas were within the Spanish division of the world. The Portuguese retired in disgust, talking of preparing an expedition to destroy any Spanish or other vessel which should venture to trade within the disputed territory. Immediately after the decision, a company was formed at Seville to prosecute the trade to the Moluccas, and Cabot was solicited to take the command. By an unfortunate selection, the persons who were put in command immediately under Cabot were personally hostile to him. The expedition sailed in April 1526, and proceeded to cross the Atlantic. On the Brazilian coast a daring mutiny, excited by his officers, compelled him to resort to the extremity of putting on shore

the three ringleaders, who were actually the persons named to succeed him in command in case of his death. Cabot explored the river La Plata and some of its tributaries, erected forts in the most favourable positions, and endeavoured to colonise the country. He despatched persons to Spain to solicit the permission of the Emperor Charles, and a supply of ammunition, provisions, &c.; and as the merchants declined to co-operate in the new undertaking, Charles took the whole expense upon himself.

About 1527 Diego Garcia, commander of a rival expedition, arrived in the Plata, ascended the Paraná, and had an interview with Cabot. Garcia claimed the discovery of the Plata River as being under orders from Charles V., and Cabot, who would not struggle for a doubtful right, descended the river with him. Garcia soon after quitted the country, but left behind him some of his followers, who were guilty of acts which roused the fierce resentment of the Guarani, but in which it is expressly declared by Herrera that Cabot took no part. The vengeance of the natives knew no distinctions; the whole nation burst with fury on the feeble colony, and Cabot was compelled to put to sea. He returned to Spain in 1531, where he resumed his old office, and is known to have made several voyages. In 1548 he resolved to return to his native country.

Edward VI. was then on the throne of England, and being very solicitous about maritime affairs, he appears to have conversed with Cabot, and to have received from him some explanation about the variation of the compass, first noticed, or at least first particularly attended to, by Sebastian Cabot. In the beginning of 1549 Edward granted him a pension of 250 marks per annum (166*l.* 13*s.* 4*d.*). Cabot remained high in the king's favour, and was consulted in all affairs relating to trade and navigation. The advice and influence of Cabot in directing an expedition to the north opened to England the valuable trade with Russia: he was made governor of the company of merchant adventurers by whom the expedition was fitted out; and the instructions delivered by him to the commander, Sir Hugh Willoughby, reflect the greatest credit on his good sense, knowledge, and humanity.

After the Russian trade was established, the exertions of Cabot were continued: the journal of Stephen Burroughs, who was despatched as commander of a vessel in 1556, shows the character of Cabot in a favourable light. Speaking of a visit to the vessel at Gravesend previous to her departure, he says:—"The good olde gentleman, Master Cabota, gave to the poore most liberrall almes, wishing them to pray for the good fortune and prosperous successe of the Serchthrift, our Pinnesse;" and at an entertainment afterwards—"for very joy that he had to see the towardness of our intended discovery, he entered into the dance himself amongst the rest of the young and lusty company."

The death of Edward VI., and the succession of Mary, put an end to the enterprise of Cabot. His pension was continued until May 1557, when it was renewed, not to him exclusively, but jointly with one William Worthington, of whom little is known. To this person all the maps and documents of Cabot were delivered, and it has been supposed that by his means they were either destroyed or put into the possession of Philip of Spain, the husband of Mary; certain it is that they are no longer to be found.

It is not known when or where Cabot died; although his friend Eden, in his dedication to the translation of 'Taisnierus's Treatise on Navigation,' gives an account of his death. He says, speaking of a mode of finding the longitude—"Cabot, on his death-bed, tolde me that he had the knowledge thereof, by divine revelation, yet so that he might not teache any man." Eden thought "the good old man in that extreme age somewhat doted, and had not yet, even in the article of death, utterly shaken off all worldlye vaine glorie."

(*Memoir of Sebastian Cabot*, London, 1831; see also Hakluyt, Purchas, Cooley, and Anderson, *History of Commerce*.)

*CABRERA, DON RAMON, a Carlist chief very prominent in some of the darkest passages of the recent history of Spain, was born at Tortosa in 1809. He lost his father in 1816, his mother, who contracted a second marriage, survived for a fate which excited the horror of Europe. Young Cabrera, who was intended for a priest, but who is said to have been found incapable of learning Latin, first became known in 1834. On the death of Ferdinand VII. in 1833, a decree was made that all the royalist volunteers or supporters of absolutism should be disarmed. The decree was generally obeyed throughout the kingdom, except in the wild district called the Maestrazgo on the borders of Aragon, Catalonia, and Castile, which became the general refuge of all the malcontents who were determined to retain their arms. General Breton, the governor of Tortosa, expelled from the town, when the times seemed to be becoming unsettled, all whom he considered suspicious characters, and among them Cabrera, more it is said to be rid of a riotous and dissolute young man than with any other view. Cabrera exclaimed as he left the town, "I swear I will make some noise in the world," and in a few months he succeeded. The wild youth, who had hitherto only organised street disturbances, turned out to be a terrible partisan chief, and was soon second in command in the Maestrazgo now in open revolt. He was ere long sent for to concert with Don Carlos in the Basque provinces; on his return the commander above him, Don Ramon Carnicer, was summoned to Don Carlos also, but was intercepted by the troops of Queen Christina, through whom he tried to make his way in disguise, was detected, and shot. Universal opinion

at the time, both of Cabrera's soldiers and the enemy, attributed to him the betrayal of the disguise of his commander, but he succeeded to the vacant command. It is now generally believed that this suspicion was unfounded, but there can be no doubt that Cabrera, now become a formidable leader, was cruel beyond even the usual licence of a partisan chief. The incensed Christinos, eager for revenge, stained their cause by an act of deep atrocity. General Nogueras seized the mother of Cabrera who was in his power, and she was sentenced to be shot, to punish the atrocities of her son. The result of the measure was that Cabrera ordered the massacre of the wives of thirty officers, and the war became a war of murder. For several years afterwards his career was one of singular daring, great military talent, and reckless cruelty. Not only did he hold the Maestrazgo against all the forces the government could bring against him, but he joined Gomez in his bold march through Andalusia; took the city of Valencia, where his sanguinary banquet of the 29th of March 1837 is remembered with horror; and he at one time threatened for some days Madrid, where it is said the timidity of Don Carlos alone prevented Cabrera from storming the royal palace. He had under his command towards the end of this civil war a body of 20,000 infantry and 800 horse. At the time of "the embrace of Bergara," in August 1839, when fortunately for Spain the cause of Don Carlos was betrayed by his other general, Cabrera was master of the Maestrazgo, and the title of Count of Morella conferred on him by Don Carlos for his successful defence of Morella against the Christinos, was borne by him in the conventions with the Christino generals, in which, at the instigation of Lord Eliot sent by the Duke of Wellington, the system of mutual slaughter was at last renounced. After Bergara he was unable to continue the contest, and in 1840 took refuge in France, where he was at first sent to the fortress of Ham, but was soon after set at liberty. In 1845 he strongly opposed Don Carlos's abdication of his rights in favour of the Count de Montemolin, but in 1848, the year of revolution, when circumstances in Spain seemed to present a favourable opening for his purposes, he returned to rekindle civil war. In an action fought at Pastoral in January 1849, he was not only defeated but severely wounded, and obliged in consequence for a second time to take refuge in France. He soon afterwards came to England, where he had previously passed some time in his first exile, and married an Englishwoman, with whom he afterwards removed to Naples. The last news we believe of his movements is that he attended the funeral of Don Carlos at Trieste.

The career of Cabrera has been treated at length by several Spanish writers. There is a life of him in four volumes by Don Buenaventura de Córdoba. An historical novel by Don Wenceslao Ayguals de Isco, entitled 'El Tigre del Maestrazgo,' depicts him in the blackest colours, and in it Cabrera is represented as having cruelly slain the author's brother. There is also a small volume in answer to this singular production by Gonzalez de la Cruz. Finally, there is a poem in honour of Cabrera published at Madrid in 1849, entitled 'El Candillo de Morella' ('The Chief of Morella'). It is admitted on all hands that for daring courage, for fertility of resources, and for presence of mind in danger, Cabrera is unmatched in the recent annals of Spain.

CA'CCIA, GUGLIELMO, commonly called MONCALVO, from Moncalvo, near Casale, the place of his abode, was born at Montabone in 1568. He was one of the best fresco painters of the 17th century, and is among the most celebrated of the Piedmontese painters. There are still several of his works in Milan, Pavia, Turin, Novara, Moncalvo, Casale, and other cities of that part of Italy. The church de' Conventuali alone, at Moncalvo, contains almost a gallery of Caccia's works in oil; they are very light in colour, but faint in effect, and in design frequently remind us strongly of the works of Andrea del Sarto, especially in his 'Holy Families' and such pieces. He is reported to have studied with the Carracci, a fact which Lanzi considers very improbable; and he says that if Caccia studied in Bologna at all, it must have been from the works of L. Sabbatini, prior to the Carracci; but he accounts for his similarity of style with that master from a picture by Soleri in Casale, from which he may have acquired it, as their styles are very similar. Bernardino Campi also painted in a very similar style. Caccia's best works in fresco are in the church of Sant' Antonio Abate at Milan, and in San Paolo at Novara. His master-piece in oil is considered to be the 'Deposition from the Cross,' in the church of San Gaudenzio at Novara: there are also two excellent altar-pieces by him in the churches of Santa Croce and Santa Teresa at Turin, and two others in a chapel of San Domenico at Chieri. Some of his landscape backgrounds are in the style of Paul Brill. Caccia died about 1625.

Caccia instructed two of his daughters in painting—Orsola Maddalena and Francesca—by whom there are many works in Moncalvo and the vicinity: the pictures of the elder, Orsola, are marked with a flower; those of Francesca with a bird. Orsola founded the Conservatorio delle Orsoline (Ursulines) in Moncalvo; she died in 1678. Francesca also survived her father many years; she died aged 57.

(Orlandi, *Abecedario Pittorico*; Lanzi, *Storia Pittorica*, &c.)

CADE, JOHN, an Irishman, who pretended and was believed by some to be a bastard relation of the Duke of York, and hence assumed the name of Mortimer. Shakspeare has made him familiarly known to us as 'Jack Cade.' The insurrection which he headed broke out in Kent in the beginning of June, during Whitsuntide week, in the year

1450, and had its origin in the wide-spread dissatisfaction occasioned by the conduct of the Duke of Suffolk, the favourite and chief minister of the king. A list of their grievances was published by the insurgents, entitled 'The Complaint of the Commons of Kent.' Among other complaints alleged by the insurgents were the following:—"That people paid not for stuff and pervergency taken for the king's use; that the king's lands in France are aliened and put away from the crown; that the people of Kent are not suffered to have free elections of knights of the shire." In addition, Cade sent a memorial to the king, expressive of great loyalty, entitled 'The Requests by the Captain of the Great Assembly in Kent,' praying him "to take about his person his true lords, and to avoid all the false progeny and affinity of Suffolk," and affirming that "the realm of France, the duchies of Normandy, Gascony, Guienne, Anjou, and Maine, were delivered and lost by means of the said traitors." This last circumstance especially irritated the nation, and to these causes of discontent were added the hardships caused by the statute of labourers and extortionate proceedings which vexed and irritated the commonalty. On the 17th of June, Cade and his followers were encamped at Blackheath. The king, who was with the parliament at Leicester, hastily collected his forces at London, and prepared to march upon the rebels. During this interval, Cade sent to the king the memorials which have been mentioned. Cade had been encamped about a week when the king's forces marched to attack him, upon which he hastily retreated to Sevenoaks. The royalists, believing the rebels were in flight, detached a portion of their forces in pursuit; upon which Cade led his followers against this detachment, which was defeated, and Sir Humphry Stafford and his brother, who commanded it, were amongst the killed. Cade now resumed his encampment at Blackheath. The royalists were distrustful of their followers, and as a popular concession, the king's council committed to the Tower Lord Say and some others, who were disliked by the people on account of their connection with the obnoxious ministry. The king's army then returned to London and dispersed. The Archbishop of Canterbury and the Duke of Buckingham were sent to negotiate with Cade, but he refused to lay down his arms until his demands were acceded to. On the 1st of July he marched from Blackheath for London. Some of the common council advised the admission of the rebels, and an alderman who opposed it was taken into custody. It was resolved that a neutral part should be taken, and the gates were opened to the insurgents. Cade rode through the streets, and struck the old London mace with his sword, exclaiming "Now is Mortimer lord of this city!" He issued proclamations forbidding plunder, and each day withdrew his followers into the Borough to prevent disorder. On the 3rd of July Cade sent for Lord Say, and had him arraigned at Guildhall. This nobleman claimed to be judged by his peers, on which he was taken by force to the Standard in Chespide, and there beheaded. The sheriff of Kent, Lord Say's son-in-law, was also beheaded, on account of his alleged extortions. The mob soon began to exhibit the usual characteristics of an undisciplined multitude. On the third day of their being in possession of the city some houses were plundered: Cade himself plundered the house where he had dined. This conduct decided the citizens, who concerted measures with Lord Scales, the governor of the Tower, and it was determined to defend the bridge and prevent the entry of the rebels. The struggle lasted during the night, but the bridge was eventually taken by the royalists, and a short truce was agreed upon. In this interval the Bishop of Winchester was sent by the archbishops of Canterbury and York, who were in the Tower, with a pardon under the great seal to all the rebels who were disposed to return to their homes. The offer was accepted by the mass of them, including Cade. Two days afterwards he again invited his followers to his standard, but they flocked around it in diminished numbers, and to attack the city was now hopeless. He therefore retired from Southwark to Rochester, where tumults and quarrels arose among the insurgents respecting the division of booty. On this Cade left them, and fled on horseback to Lewes in Sussex. A reward of 1000 marks being set upon his head, he was taken by an esquire named Alexander Iden, and killed, after a desperate resistance, July 11. His head was placed on London bridge. The remainder of the rebels returned to their homes as quietly as possible. Some were taken and executed.

CADMUS, the name of several persons in Greek history. The most famous was the legendary founder of Thebes, who was the son of Agenor, king of the Phœnicians, and was sent in search of his sister Europa, who had been carried off, according to the old fable, by Jupiter under the form of a bull. Cadmus touched at Thera, where he left Membræus and some of his followers (Herod., iv., 147), and thence proceeded to Boeotia, where, in obedience to the oracle, he formed a settlement on a spot pointed out by a heifer which he had followed, and which lay down by the streams of Dirce. He had however in the first place to kill a fierce dragon who guarded the place, and on sewing the monster's teeth as he was directed to do, a host of armed men sprung from the ground, and fought with one another till all but seven were slain. These seven joined Cadmus in founding Cadmeia, subsequently the citadel of Thebes; hence the Thebans were called Sparti ('sown-men'). All these legends are given successively in a chorus of Euripides ('Phœnissæ,' 641-680, and Scholiast.), and various attempts have been made to explain them. Some contend with Herodotus for the Phœnician origin of the traditions, others refer

them to Egypt, and one modern scholar has endeavoured to prove that Cadmus was the leader of a Cretan colony. We are inclined to believe with Müller that Cadmus was an old Pelasgian god. Indeed very strong evidence has been given that he was identical with Cadmilus, the father of the Cabiri, and that his wife Harmonia was also connected with the Samothracian rites. (Müller's 'Orchomenos,' p. 461.) The legend goes on to relate that he and his wife were changed into serpents, and that he retired to Illyria (Pausan., ix. 583), from whence he led a host of barbarians into Greece and sacked Delphi (Herod., v. 61, ix. 48; Eurip., 'Bacchæ,' 1333; Niebuhr, 'Hist. Rom.,' i. p. 50). To Cadmus is attributed the invention of seventeen letters of the Greek alphabet; the remaining eight having been added by Palamedes and Simonides. (Pliny, 'Hist. Nat.,' t. vii., c. 56.)

CADMUS, of Miletus, was the first Greek prose writer. He lived towards the end of the 7th or the beginning of the 6th century B.C., and wrote a history, in four books, of the foundation of his native city and the colonisation of Ionia, which was epitomised by Bion of Proconnesus. (Clem. Al. Strom., vi. p. 629; Pliny, 'Hist. Nat.,' vii. 56, v. 29; Isocrates, 'Περὶ Ἀντιδόκου.')

CADODAL, GEORGES, the son of a poor miller, was born in 1769, in the neighbourhood of Auray in Lower Brittany. He received that education of the mind, with religion for its basis, which has always distinguished the western population of France. One of the first to answer the call to arms of the royalists, he collected, in March 1793, a body of 50 Bretons, traversed the woods, fought several combats, and joined the main army at Fougères. He was afterwards present at the siege of Granville, at the battle of Mans, and other engagements. Next, assisted by his steadfast friend Lemercier, he achieved an insurrection in the Morbihan. This was his talent: none of the patriot leaders knew better than Georges how to move the passions of the simple peasantry, by his denunciation of the republic and his advocacy of the Bourbons. In 1794 he was captured by a party of republican soldiers, and sent as a prisoner to Brest.

After a few months' captivity he made his escape, with several of his companions, and became a leader (chef de canton). In July 1795, during the misunderstanding between the Vendean generals and the emigrant officers, after the landing of Puisaye and Quiberon, Georges strove hard to rescue a portion of the Chouan army from the disaster which followed. The royalists were fearfully slaughtered by the army of Hoche, but Cadoudal effected the retreat of a strong party. He soon took upon himself the conduct of the insurrection in Lower Brittany; and, irritated at the conduct of the leaders of the late ill-starred expedition, he organised an army of peasants, admitting neither noble nor emigrant officer to any share in the command. During the latter part of 1795 and the early part of 1796, the great military talents of Hoche tried most severely the patience and endurance of the Chouans; still their hardy leaders kept them from disbanding.

Then followed two years of inaction, whilst the faithful Chouan was waiting for the signal to be sent from Paris to resume the offensive. In January 1799, Georges Cadoudal, who had never dissolved his little band, intimated to the royalist leaders that everything was ready for a speedy insurrection. The following August he mustered his forces, and occupied the camp of Beauchêne. Other chiefs united their bands with his, but Cadoudal's was the most considerable, and, submitting to his authority, they invested him with the chief command of the Morbihan and Côtes-du-Nord. A great civil war was imminent; the flames had spread through the provinces of Marne, Normandy, and Brittany, when the abrupt explosion of the great conspiracy of the 18th Brumaire paralysed the royalists and raised Bonaparte to power. The inflexible Chouan resisted still, fought the battles of Grand-Champ and Elven (1800), and was the last to think of peace.

Georges Cadoudal now went to Paris, and became the object of the First Consul's admiring notice. The master of France used every art to win him over to his service, but nothing could shake the constancy of this rude chief. Bonaparte then strove to arrest him; but the Chouan fled to England, where he was treated with great distinction. The Comte d'Artois, with his own hand, gave him the cordon rouge in the king's name. Towards the end of 1800 he returned to Brittany, again evoked the loyalty of that population, and ordered several spies to be shot, whom the First Consul had sent as emissaries to entrap him.

In 1802, being once more in England, he allied himself with Pichegru to overturn Bonaparte. Georges proposed to attack him openly, and cut through his guards. To this end, he landed secretly in France on the 21st of August 1803, and making his way to Paris, lay hid there for six months, waiting for the signal to be given by Moreau and Pichegru. At length, on the 4th of March 1804, he was surprised in a cabriolet, near the Luxembourg, and captured by a party of police, after he had killed one man and wounded another. At his trial he boldly avowed his devotion to his 'legitimate' king. He was condemned to death, and executed on the 25th of June, at the age of thirty-five. "His mind," said Napoleon, "was cast in the true mould; in my hands he would have done great things. I knew how to appreciate his firmness of character."

(Biog. Univers.; Bourrienne; Alison, *History of Europe*.)

CÆCILIUS, STATIUS, a Gaul, originally a slave. He received the name *Cæcilius* when he became free. He died about one year

after his friend Ennius, that is, B.C. 168. Cæcilius wrote some forty comedies in the Latin language, of which only very brief fragments remain in the writings of Cicero, Aulus Gellius, and the grammarians. His merit has been variously estimated by the ancients. Cicero ('Ad Attic.' vii. 3) condemns his style as bad, and Quintilian (x. i.) does not assent to the praises which had been bestowed on him by others. Horace ('Epist.' ii. i. 59, 'De Art. Poet.' 54), on the contrary, praises him as in some points superior to Plautus and Terence; and Vulgatus Sedigitus (in 'Aul. Gell.' xv. 24) gives him the highest rank in comedy. Many of his plays were imitations of Menander; and Aulus Gellius (ii. 23) says that when he read them separately they appeared rather pleasing and lively, but that when compared with the Greek originals they were perfectly disgusting. In the same very valuable chapter Aulus Gellius gives a scene from the Ploecium (πλόκιον, 'necklace') of Cæcilius with the scene of Menander from which it is copied. They differ as much in brightness, he says, as the arms of Diomed and Glaucus. (Terence, 'Heu. Prol.' 5.)

CÆDMON, the father of English song, or the first person of whom we possess any metrical composition in our vernacular language. This composition is a kind of ode consisting of no more than eighteen lines, celebrating the praises of the Creator. It is preserved in Alfred's translation of Bede. Bede gives the following account of the production of it, and of the author. Cædmon was in some kind of connection with the monks of Whitby: he seems to have had the care of their cattle. It appears to have been the custom of our Saxon forefathers to amuse themselves at the supper hour with improvisatore descants accompanied by the harp, as is still practised at meetings of the Welsh bards. Cædmon, far from having the gift of song, when the harp passed round among the guests, was fain as it approached him to shrink away from the assembly and retire to his own house. Once after it had thus happened as he was sleeping at night, some one seemed to say to him, "Cædmon, sing me something!" He replied, "I cannot sing;" and he told how his inability to sing had been the cause of his quitting the hall. "Yet thou must sing to me," said the voice; "What must I sing?" said he; "Sing me the origin of things." The subject thus given him, he composed the short ode in question. When he awoke, the words were fast in his mind.

Cædmon in the morning told his vision and repeated his song. The effect was that the Abbess Hilda and the learned men whom she had collected round her in her monastery at Whitby believed that he had received from Heaven the gift of song, and when on the morrow he returned with a beautiful poetic paraphrase of a passage of Scripture which they had given him to verify as a test of the reality of his inspiration, they at once acknowledged the verity, and earnestly besought him to become a member of their company. He continued to receive poetic inspiration, and he composed numerous poems on sacred subjects, which were sung in the abbey for the edification of its inhabitants. Sacred subjects were his delight, and to them he confined himself. He continued in the monastery for the remainder of his life, and there he died, as is conjectured, about 680.

The authenticity of the little poem above mentioned is perhaps unquestionable. But besides this, a very long Saxon poem, which is a metrical paraphrase on parts of the Scriptures, is attributed to Cædmon. An edition of it was printed at Amsterdam in 1655, under the care of Junius. Hickes expresses doubts whether this poem can be attributed to so early a period as the time of Cædmon. He thinks he perceives certain Dano-Saxonisms in it which would lead him to refer it to a much later period. It has been again printed with a much more accurate text, by Mr. Thorpe, as a publication by the Society of Antiquaries, London, 8vo, 1832. Mr. Thorpe is of opinion that it is substantially the work of Cædmon, but with some sophistications of a later period, and in this opinion our best Anglo-Saxon scholars appear inclined to coincide. The poem seems to have been popular, and to have been much used in later times by the makers of the mysteries which furnished so much of the amusement of our ancestors. An attempt has been made to show that the parts respecting the creation and our first parents had been studied by Milton.

CÆLIUS AURELIANUS, the only remaining writer of the sect of the Methodici in medicine, is believed to have been born at Sicca in Africa. The time when he lived is uncertain; as neither he nor Galen mention each other, it has been supposed that they were contemporaries; while others have thought, from the barbarousness of his style, that he must have lived as late as the 5th century. But his African origin as well as the imperfect education which, in common with the majority of the Methodici, he probably received, will account for his barbarous Latinity, as well as his blunders in Greek. His work, which consists of eight books, three on acute and five on chronic diseases, is a translation into Latin of the writings of Soranus, a Greek physician, of the time of Hadrian, with additions from his own practice and from other authors.

Cælius Aurelianus appears to have been an observant practitioner, and gives several original cases in medicine as well as surgery. The medical sect of the Methodici held a middle place between the dogmatists and the empirics. The dogmatists maintained that the practice of physic must depend upon the theory, and that he who is ignorant of the origin of diseases cannot treat them with advantage. The empirics, on the other hand, alleged that medicine depends on experience alone, and that the physician, like the husbandman or the steersman, is formed by practice, not by discussion. The former sect studied anatomy, the latter neglected it. (Celsus, 'de Med.' lib. i.) The Methodici combined something of the theoretical turn of the dogmatists with the practical simplicity of the empirics, but it must be owned that they carried this simplicity too far. Thus Themison, their founder, "reduced all diseases to three kinds only, the *strictum*, the *laxum*, and the *mixtum*; the last consisting of the strictum in one part of the body, and of the laxum in another. He maintained that it was enough to refer any particular disease to one or other of these three heads, in order to form the proper indications of cure. This easy plan was, by way of eminence, called the Method, and the persons who followed it the Methodics." (Cullen, 'Introductory Lectures,—History of Medicine.')

With them, as with others, theory sometimes succeeded in stifling the best-established practice. Thus the Methodici, not satisfied with banishing specifics from the practice of physic, declared war even against purgatives. These remedies had been denounced by Chrysippus, Erasistratus, Asclepiades, and Thessalus; and Cælius agrees with them. On the whole however Cælius Aurelianus ranks high among the second class of medical writers—among those who, though not great discoverers, yet hand down to posterity, with useful additions, the rich inheritance of knowledge which they have received.

The first editions of Cælius Aurelianus are that of Paris, 1529, folio, containing only the three books on acute diseases, and that of Basel, of the same year and size, containing only the five books on chronic diseases. There is a complete edition by Dalechamp with marginal notes, Lyon, 1567, 8vo. The best edition is that of Almeloveen, Amsterdam, 1722 and 1755. The last complete edition is that of Haller, in two volumes, 8vo, 1774.

(Sprengel, *Essai d'une Histoire pragmatique de Médecine; Hist. traduit par Geiger*, tom. ii.; Le Clerc, *Histoire de la Médecine*; Haller, *Biblioth. Med.*, vol. ii.)

CÆSAR (Kaisar), the cognomen or distinctive family name of a branch of the illustrious Julian gens or house. Various etymologies of the name have been given by Roman writers, but they all seem unsatisfactory, and some of them ridiculous, except that which connects it with the word *casaries*, properly 'the hair of the head.' It was not unusual for the family names among the Romans to be derived from some personal peculiarity: examples of this are Naso, Fronto, Calvus, &c. The Julian gens was one of the oldest patrician houses of Rome, and the branch of it which bore the name of Caesar deduced its origin from Iulus, the son of Æneas, and consequently claimed a descent from divine blood. (Sueton. 'Caesar.')

The Julian gens is traced back historically to A.U.C. 253, or B.C. 501, but the first person who bore the distinctive family name of Caesar is probably Sextus Julius Caesar, who was quæstor A.U.C. 532, and from Caius Julius Caesar, the dictator, may be traced through five descents. ('Transactions of the Royal Society of Literature,' vol. i. pt. 2.)

In pursuance of the will of C. J. Caesar, the dictator, Octavius, afterwards the Emperor Augustus, who was the grandson of the dictator's sister, Julia, took the family name of Caesar. Tiberius Nero who was adopted by his stepfather Augustus, also took the name of Caesar. Caligula and Claudius, his successors, were descended from Julia, the dictator's sister; and in the person of Nero, the successor of Claudius, the family of Caesar became extinct. Nero was removed five descents from Julia, the dictator's sister. [AUGUSTUS.]

When Hadrian adopted Ælius Verus, who was thus received into the imperial family, Verus took the name of Caesar. Spartianus, in his life of Ælius Verus, remarks, "Verus was the first who received the name of Caesar only, and that not by will, as before, but pretty nearly in the same way as in our times (the reign of Diocletian) Maximianus and Constantius were named Cæsars, and thus designated as heirs to the empire." Thus the term Augustus under the later emperors signified the reigning prince, and Caesar or Cæsars denoted the individual or individuals marked out by the emperor's favour as being in the line of succession.

CÆSAR, CAIUS JULIUS, the son of C. J. Caesar and Aurelia, was born B.C. 100, on the 12th of Quintilis, afterwards called Julius from the name of the person of whom we are speaking. His aunt Julia was the wife of Caius Marius, who was seven times consul. In his seventeenth year he married Cornelia, the daughter of Cinna, by whom he had a daughter, Julia. This connection with Marius and Cinna, the two great opponents of the dictator Sulla, exposed him to the resentment of the opposite faction. By Sulla's orders he was deprived of his wife's dowry and of the fortune which he had inherited by descent, stripped of his office of priest of Jupiter (Flamen Dialis) and compelled to seek safety by flight. (Plut. 'Caesar,' l.; Suetonius, 'Caesar.')

Sulla is said to have spared his life with great reluctance, observing to those who pleaded his cause, that the youth "would be the ruin of the aristocratic party, for there were many Marii in Caesar." He first served under M. Thermus in Asia, and distinguished himself at the capture of Mitylene (B.C. 80 or 79); but his reputation suffered by a report (possibly an unfounded one) of scandalous profligacy during a visit which he paid to Nicomedes, the king of Bithynia. In the following year he served under Servilius Isauricus in Cilicia. The news of Sulla's death soon brought him back to Rome, but he took no part in the movements of M. Æmilius Lepidus, who made a

fruitless attempt to overthrow the aristocratical party, which had been firmly established during the tyranny of Sulla. It is not unlikely, as Suetonius observes, that he had no confidence in Lepidus, and that he had penetration enough to see that the time was not come for founding the aristocracy of Rome. Whatever opinion may be entertained as to Caesar having very early formed a design to seize on the government power, it is at least certain that from his first appearance in public life he had a settled purpose to break the power of the aristocracy, from which he and his relatives had suffered so much. After his successful impeachment of Dolabella for misadministration in his province, he retired to Rhodes, and for a time became the pupil of the rhetorician Maecius, one of the greatest masters of the art, whose instruction Cicero had attended, probably a year or two before Caesar's visit.

For some time Caesar seems to have had little concern in public life, being kept in the background by the predominance of the aristocratical party, and the successful career of Metellus, Lucullus, Crassus, and Pompey. About *b.c.* 65, being elected one of the military tribunes, he had sufficient influence to produce an enactment for the restoration of L. Clodius, his wife's brother, and of those partisans of Lepidus who after his death had joined Sertorius in Spain. (Suetonius.) The following year he was quaestor in Spain, and on his return to Rome he was elected *Ædile* for *b.c.* 65. Just before entering on office he fell under some suspicion of being engaged in a conspiracy to kill the consuls Cotta and Torquatus, and effect a revolution. Whether there really was a conspiracy or not may be doubted; Caesar's share in it at least is not clearly established. The office of *Ædile* gave Caesar an opportunity of indulging his taste for magnificence and display, by which at the same time he secured the favour of the people. He beautified the city with public buildings, and gave splendid exhibitions of wild beasts and gladiators. Caesar, who was now five-and-thirty years of age, had enjoyed no opportunity of distinguishing himself in a military capacity; while the more fortunate Pompey, who was only six years older, was spreading his name and the terror of the Roman arms throughout the East. A favourable occasion seemed to present itself in Egypt. Alexander, the king who had been honoured with the name of friend and ally of the Roman people, was ejected from Alexandria by the citizens. The popular feeling at Rome was against the Alexandrians, and Caesar thought he had interest enough through the tribunes and the democratical party to get appointed to an extraordinary command in Egypt; but the opposite faction was strongly united against him, and he failed in his attempt. The next year he was more successful. By a judicious application of money among the poorer voters, and of personal influence among all classes (Dion. xxxvii. 37), he obtained the *Pontificatus Maximus*, or wardenship of the ecclesiastical college of Pontifices, a place no doubt of considerable emolument, to which an official residence in the *Sacra Via* was also attached. (Sueton. 'Caesar,' 13, 46.) This union of civil and religious functions in the same person, at least in the higher and more profitable places, was a part of the old Roman polity, which, among other consequences, prevented the existence of a hierarchy with a distinct and opposing interest.

At the time of the important debate on the conspiracy of Catiline (*b.c.* 63), Caesar was *praetor designatus* (*praetor elect* for the following year), and accordingly spoke in his place in the senate. He was the only person who ventured to oppose the proposition for putting the conspirators to death; he recommended their property to be confiscated, and that they should be dispersed through the different municipalities of Italy, and kept under a strict surveillance. The speech which Sallust has put into his mouth on this occasion, if the substance of it be true, will help us to form some estimate of Caesar's character and his policy at this period. The address is singularly well adapted to flatter the dominant party, and also to keep up his credit with those who were hostile to the aristocratic interests. His object was to save the lives of the conspirators, under the pretext of inflicting on them a punishment more severe than that of death. But for Cato he might probably have carried his motion. According to Suetonius, Caesar persevered in his opposition till his life was actually threatened by the armed Roman equites, who were introduced into the senate-house under the pretext of protecting the senate during their deliberations. (Compare Plut. 'Caesar,' viii.) Cicero, who was then consul, and in the height of his prosperity and arrogance, might, it is said, by a single nod, have destroyed the formidable opponent of the order of which he had become the devoted champion; but either his courage failed him, or some motive perhaps more worthy, led him to check the fury of the Equites. In the following year, during his praetorship, the opposite faction in the senate, who were bent on crushing Caesar's rising influence, actually passed a decree (*decretum*) by which Q. Cicerius Metellus Nepos, one of the tribunes of the plebs, and Caesar, who strongly supported him in his measures, were declared incapable of continuing in the exercise of their official duties. Caesar still discharged the judicial functions of his magistracy, till he found that force would be used to compel his submission to this illegal and impious act of the senate. The populace were roused by this strange proceeding, and Caesar apparently might have had their best assistance against his enemies; but prudence for the present induced him to check the zeal of his partisans, and the senate, apparently alarmed by this demonstration, repealed their own decree, and thanked him for his conduct.

An affair which happened during Caesar's praetorship caused no little scandal at Rome. While the ceremonies in honour of the *Bona Dea* were performing in the house of Caesar, at which women only could be present, the profligate Clodius, putting on a woman's dress, contrived to get admission to these mysterious rites. On the affair being discovered Caesar divorced his wife Pompeia, whom he had married after the death of Cornelia; and Clodius, after being brought to a public trial on a charge of impiety, only escaped by bribing the judges or jury. (Cic. 'Ep. ad Att.' i. 12, &c.; Dion. xxviii. 45.) From motives of policy Caesar did not break with Clodius: he probably feared his influence, and already saw that he could make him a useful tool, and a bugbear to Cicero.

The year *b.c.* 60 was spent by Caesar in his province of Hispania Ulterior, or Southern Spain, where he speedily restored order and hurried back to Rome before his successor came, to canvass for the consulship. The aristocratical party saw that it was impossible to prevent Caesar's election; their only chance was to give him a colleague who should be a check upon him. Their choice of Bibulus seems to have been singularly unfortunate. Bibulus was elected with Caesar in opposition to Lucceius, with whom Caesar had formed a coalition, on the condition that Lucceius should find the money, and that Caesar should give him the benefit of his influence and recommendation. The scheme of Caesar's enemies proved a complete failure. Bibulus, after unavailing efforts to resist the impetuosity of his colleague, shut himself up in his house, and Caesar, in fact, became sole consul. (Dion. xxxviii. 8.) In order to stop all public business, Bibulus declared the auguries unfavourable; and when this would not answer, he declared that they would be unfavourable all through the year. This illegal conduct only tended to justify the violent measures of his colleague. The affair, though a serious one for the hitherto dominant faction, furnished matter for the small wits of the day, who used to sign their notes and letters in the 'Consulship of Julius and Caesar,' instead of naming both consuls in the usual way.

Caesar had contrived, by a masterly stroke of policy, to render ineffectual all opposition on the part of his opponents. Pompey was dissatisfied because the senate delayed about confirming all his measures in the Mithridatic war and during his command in Asia; Crassus, who was the richest man in the state, and second only to Pompey in influence with the senatorial faction, was not on good terms with Pompey. If Caesar gained over only one of these rivals, he made the other his enemy; he determined therefore to secure them both. He began by courting Pompey, and succeeded in bringing about a reconciliation between him and Crassus. It was agreed that there should be a general understanding among the three as to the course of policy; that all Pompey's measures should be confirmed, and that Caesar should have the consulship. To cement their alliance more closely, Caesar gave Pompey his daughter Julia in marriage, though she had been promised to M. Brutus. (Plut. 'Pomp.' 47.) Caesar also took a new wife on the occasion, Calpurnia, the daughter of Piso, whom he nominated one of the consuls for the ensuing year. This union of Pompey, Crassus, and Caesar is often called by modern writers the first triumvirate. The effect of it was to destroy the credit of Pompey, throw disunion among the aristocratic party, and put the whole power of the state in the hands of one vigorous and clear-sighted man. (As to the affair of Vettius [Dion. xxxviii. 9], see Cicero.)

It is unnecessary to detail minutely the acts of Caesar's consulship. From the letters of Cicero, which are contemporary evidence, we perceive that the senate at last found they had got a master whom it was useless to resist; Cato alone held out, but he stood by himself. One of the most important measures of Caesar's consulship was an Agrarian law for the division of some public lands in Campania among the poorer citizens, which was carried by intimidation. Pompey and Crassus, who had given in to all Caesar's measures, accepted a place in the commission for dividing these lands. Clodius, the enemy of Cicero, was, through Caesar's influence, and the help of Pompey, adopted into a plebeian family, and thus made capable of holding the office of tribune; an event which Cicero had long dreaded, and fondly flattered himself that he should prevent by a temporising policy. Clodius, the next year, was elected a tribune, and drove Cicero into exile. (Dion. xxxviii. 12, &c.)

The Roman consuls, on going out of office, received the government of a province for one year. Caesar's opponents unwisely made another and a last effort against him, which only resulted in putting them in a still more humiliating position: they proposed to give him the superintendence of the roads and forests. Vatinius, one of his creatures, forthwith procured a law to be passed, by which he obtained for Caesar the province of Gallia Cisalpine, or North Italy, and Illyricum, for five years; and the senate, fearing the people might grant still more, not only confirmed the measure, but, making a merit of necessity, added the province of Gallia Transalpine. "From this moment," remarks a lively modern writer (Schlosser, 'Universal Histor. Ueberblick'), "the history of Rome presents a striking parallel to the condition of the French republic during Bonaparte's first campaigns in Italy. In both cases we see a weak republican administration in the capital involved in continual broils, which the rival factions are more interested in fostering, than in securing the tranquillity and peace of the empire. In both cases we find a province

of the distracted republic occupied by a general with unlimited power—the uncontrolled master of a territory which, in extent and importance, is equal to a mighty kingdom—a man of superior understanding, desperate resolves, and, if circumstances rendered it necessary, of fearful cruelty—a man who, under the show of democratical opinions, behaved like a despot, governed a province at his pleasure, and established an absolute control over his soldiers by leading them to victory, bloodshed, and pillage."

The Gallic provinces at this time subject to Rome were: Gallia citerior, or Cisalpine Gaul (North Italy); and Gallia ulterior, or the southern part of Transalpine Gaul, also called emphatically 'Provincia' (whence the modern Provence), whose capital was Narbo, now Narbonne. The Provincia extended from the Mediterranean to the Cebenna Mountains, and included the modern provinces of East Languedoc, Provence, and Dauphiné. On the north it joined the Allobroges, then lately subjected to Rome. When Cæsar, in his 'Commentaries,' speaks of Gaul, which he divides into Aquitania, Celtica, and Belgica, he means the Gaul which was then independent, and which he conquered, exclusive of the Provincia already subject to Rome.

In March B.C. 58, while Cæsar was still at Rome, news came that the Helvetians, united with several German tribes, were leaving their country with their wives and children in order to settle in Southern Gaul, and were directing their march upon Geneva to cross the Rhône at that place. Cæsar hastened to Geneva, cut the bridge, and raised a wall or entrenchment between the Rhône and the Jura in order to close the passage against the Helvetians. The Helvetians asked permission to pass through the Roman province on their way to the country of the Santones (Saintonge), as they said, and on Cæsar's refusal they resolved to cross the Jura higher up into the country of the Sequani (Franche Comté), with whom they entered into negotiations to that effect. Cæsar, foreseeing danger to the Roman province if the Helvetians succeeded in settling themselves in Gaul, resolved to prevent them at all risks. He left his lieutenant Labienus at Geneva, with the only legion he had in the province, and hastened back to Cisalpine Gaul, where he raised two fresh legions, and summoned three more which had wintered near Aquileia. With these five legions (about 30,000 men) he took the most direct road to Gallia ulterior, crossing the Alps by Ocellum (Exilles, between Susa and Briançon), and marched through the province to the country of the Segusiani, the nearest independent Gaulish people, who lived near the confluence of the Rhône and the Arar (the Saône). The Helvetians meantime having crossed the country of the Sequani had reached the Arar, which divided the Sequani from the Ædui, a considerable nation of Celtic Gaul, who extended from the Arar to the Ligeris, and who were friendly with Rome. The Ædui applied to Cæsar for assistance. He watched the motions of the Helvetians, and having learnt that three-fourths of their number had crossed the Arar, he marched at midnight with three legions, and fell upon those who still remained on the east bank with the baggage, and killed or dispersed them. These were the Tigurini, who, about fifty years before, having joined the Cimbri, had defeated and killed the Roman consul L. Cassius. Cæsar crossed the Arar in pursuit of the Helvetian main body. After a useless conference between Cæsar and old Divico the Helvetian leader, the Helvetians continued to advance into the country of the Ædui, and Cæsar after them. Cæsar's cavalry, 4000 strong, composed of Gaulish horsemen raised in the Provincia and among the Ædui, had the worst in an engagement against 500 Helvetian horsemen. Cæsar discovered that there was a party hostile to Rome among the Ædui, at the head of which was Dumnorix, a young man of great wealth, influence, and ambition, who secretly favoured the Helvetians, although he actually commanded a body of the auxiliary cavalry under Cæsar. At the same time the provisions which the Ædui had promised to supply to the Roman army were not forthcoming. Cæsar sent for Divitiacus, the brother of Dumnorix, a Druid, who was friendly to Rome, and told him all he knew about his brother's double dealing. Divitiacus acknowledged his brother's fault, and obtained his pardon. We find afterwards ('De Bello Gallico,' v. 7), that Dumnorix continued in his heart hostile to the Romans, and at the time of Cæsar's first expedition into Britain refused to embark with his auxiliaries, left Cæsar's camp, was followed, overtaken, and put to death.

The movements of the Helvetians through the country of the Ædui must have been very slow and circuitous, for we find that Cæsar, after following them for a fortnight, was about 18 miles from Bibracte (Autun), which is not above 80 miles from the most distant point of the Arar where they could have crossed. Cæsar, who had now only two days' provisions left, gave up the pursuit, and took the road to Bibracte, the principal town of the Ædui. The Helvetians mistaking this movement for a retreat, turned round and followed the Romans. Cæsar halted on a hill, formed his four old legions in three lines half-way up the hill, and placed in their rear higher up the two new legions, as well as the auxiliaries. The baggage he assembled and entrenched on the summit of the hill. The Helvetians, whom Cæsar on this occasion calls Gauls, for they were in fact a Celtic race, having left all their baggage, waggon, and families in one spot, closed their ranks and formed their phalanx, repulsed Cæsar's cavalry, and advanced to attack his first line. Numbers were vastly in their

favour. Cæsar, having dismounted, sent away his own and all the other horses, to preclude all hope of flight, and having harangued his men, gave the signal for battle. The legionaries, from their elevated position, threw their javelins with great force upon the advancing Helvetians, and having disordered their phalanx, rushed sword in hand upon them. Owing to the close order of the Helvetian ranks it happened that, in many instances, the Roman javelins transfixed two shields at once, so that the bearers being unable to extricate one from the other, were obliged to throw their shields away and fight unprotected. At last, covered with wounds, the Helvetians retired toward a mountain a mile distant. The Romans followed them, but were attacked in flank by the Boii and Tulingi, 15,000 strong, who formed the Helvetian rear-guard. Cæsar ordered his third line to face about and repel these new enemies, while the other two were engaged against the Helvetian main body who had halted and returned to the charge. This double fight lasted from noon to sunset, during which time none of the Helvetians were seen to turn their backs. They withdrew at last, one part to the mountain and the rest to their baggage, where they continued to fight desperately behind their carts during the night, till they were nearly all killed. The other part, to the number of 130,000 individuals, moved off during the night, and marching in a north direction arrived in the country of the Lingones (Langres): the Romans were unable to follow them, being detained three days on the field of battle in attending to their wounded and burying their dead.

In the Helvetian camp were found written tablets containing the muster of the different tribes which composed the emigration, to the number of 368,000 individuals, of whom 92,000 were fighting men. Cæsar says the tablets were written in Greek characters: it has been supposed by some that they were Etruscan letters somewhat resembling the old Greek, and perhaps introduced into Helvetia by the Rheti or Rasena, an Etruscan people.

After three days, Cæsar marched in pursuit of the Helvetians, who threw themselves on his mercy. Cæsar demanded their arms, hostages, and the surrender of the slaves and other fugitives who had taken refuge among them; and they were ordered to return home, and cultivate their lands. The Boii alone, distinguished for their bravery, were allowed to remain among the Ædui at the request of the latter. A part of one of the Helvetian tribes, pagus Verbigenus, 6000 in number, having marched off in the midst of the confusion and darkness of the night, and taken the way towards the Rhine and Germany, were pursued by Cæsar's order, brought back and "treated as enemies," which then meant that they were either put to death or sold as slaves. The Helvetians, who returned home, were mustered by Cæsar, and found to be 110,000 individuals, men, women, and children.

Cæsar says that his principal object in sending the Helvetians back was to prevent the Germans beyond the Rhine from occupying their country and becoming formidable neighbours to the Roman provinces. The report of Cæsar's victory spread rapidly through all Celtic Gaul, the various tribes of which began to look up to him as their arbiter in their internal differences. The Ædui complained to him that Ariovistus, a powerful king of the Germans, being invited by the Sequani and the Arverni, between whom and the Ædui there was an old rivalry, had crossed the Rhine some time before with 15,000 men, who had afterwards increased to 120,000, had defeated the Ædui and their allies in a great battle, had occupied several provinces of Gaul, exacted hostages of them, and was in fact oppressing the country. The Gauls described the Germans as an athletic, fierce, and formidable people. Cæsar, who, during his consulship in the previous year, had induced the senate to acknowledge Ariovistus as a king and friend of Rome, now sent to him requesting an interview, which the German declined. Cæsar then required him by message to desist from bringing over the Rhine fresh bodies of Germans, and from molesting the Ædui and their allies, who were neighbours to the Roman Province, and to restore their hostages. Ariovistus replied that as he had never dictated to the Romans what use they should make of their victories, he would not be dictated to by them; and that the Ædui were his tributaries by force of arms.

Cæsar, learning that other Germans, and particularly the Suevi, a powerful nation, were approaching the Rhine to join Ariovistus, determined on attacking him. He occupied Vesontio (Besançon), a strong town of the Sequani, before Ariovistus could seize it. The fearful reports of the Gauls about the Germans spread alarm in Cæsar's camp, especially among the young officers, military tribunes, prefects, and others, accustomed to the luxuries of Rome, and who had followed Cæsar out of personal friendship (I. 39). Skulking in their tents, they lamented their fate, and were busy making their last wills. The panic spread to the veterans, and Cæsar was told that it would be impossible to advance farther; that the roads were impracticable; that no provisions could be collected, and, in short, that the soldiers would not follow him if he raised his camp. Having assembled the officers, he told them that it was not their business to discuss the measures and orders of their general, ridiculed their fears of the Germans, since the Cimbri and Teutones, the most formidable of that race, had been defeated by the Roman arms, and signified to them that he would raise the camp next morning, and if they refused to follow him, would march forth with the tenth legion alone. This was Cæsar's favourite regiment. This harangue had its full effect, and Cæsar marched from Vesontio to meet Ariovistus. After a fruitless interview between the

two drafts, which is graphically described by Cæsar, Ariovistus arrested and put in chains Valerius Proculus, Cæsar's friend and confidential interpreter, and Metellus, who had gone to the German camp to renew the negotiations. Cæsar prepared for battle, but Ariovistus remained in his camp for several days, because, as Cæsar was informed by the prisoners, the German matrons had declared that their countrymen would be losers if they fought before the new moon. Accordingly the Romans general determined to make the attack. The Germans came out, and formed for battle in phalanxes by order of nations, the Harudes, Marcomanni, the Triboci, the Vangiones, the Nemetes, the Sebaeni, and the Suevi; and they placed their waggons, baggage, and women, in a semicircle behind them so as to prevent escape. The signal being given, both armies rushed to the encounter with such rapidity that the Romans had not time to throw their javelins, and at once resorted to their swords. Cæsar, perceiving that the left of the enemy was the weakest, commenced the attack on that point; many of the soldiers went up, and, grasping the enemies' shields, tried to snatch them away. Meantime the German right was pressing hard upon the Romans, who were much inferior in numbers, when young Crassus (the son of Læcinius), who commanded the cavalry, moved the third or rear line obliquely to the support of the left, and thus recovered the advantage. The Germans gave way, and fled towards the Rhine, which was 80 miles distant, being pursued by Cæsar's cavalry. Many fell, some swam across the river, others, and Ariovistus among the rest, passed it in boats. Ariovistus's two wives and one daughter were killed in the fight; another daughter was taken. Valerius Proculus and Metellus were both rescued, to the great satisfaction of Cæsar.

Cæsar, having thus terminated the campaign, put his troops in winter quarters among the Sequani, and himself crossed the Alps to Cisalpine or Cispadine Gaul, to hold the usual courts for the administration of justice and the civil business of the province.

The campaign of B.C. 57 was against the Belgic Gauls, a powerful race of German origin, who had been long settled in the country between the Rhine and the Sequana (Seine). Alarmed by the advance of the Romans through Celtic Gaul, the Belgæ had, during the winter, formed a confederacy, and prepared themselves for resistance. Cæsar, with the usual logic of conquerors, found in these preparations a pretext for attack. He raised two more legions in Cisalpine Gaul, and proceeded at the beginning of summer to his camp in the Sequani. He then advanced with eight legions, and in fifteen days reached the country of the Remi, the first Belgic people on that side. The Remi made their submission, and gave him every information concerning the extent and the strength of the confederacy, which amounted, they said, to 200,000 fighting men. After crossing the river Axona (Aisne), Cæsar fixed his camp on the right or farthest bank, and fortified it with a rampart 12 feet high and a ditch 18 feet deep. The Belgians made some demonstrations against him, but Cæsar kept quiet in his entrenchments, and the Belgæ broke up for want of provisions, and resolved to fight each in his own territory. After subduing the Suessiones, the Bellovaaci, and the Ambiani, Cæsar marched against the Nervii, the most powerful of the Belgic nations. A desperate battle was fought on the banks of the Sabis (Sambre), in which the Nervii actually overtook the Roman soldiers while in the act of tracing and entrenching their camp, and before they had time to form or to put on their helmets. Cæsar's cavalry, auxiliaries, servants, drivers, and followers of the camp fled away, spreading the report of the defeat of the Romans. Cæsar hurried from legion to legion, encouraging the men, and finally succeeded in re-establishing order. The tenth legion came to turn the flank. The Nervii fought desperately to the last, and their nation and name, said Cæsar, were nearly extinguished on that day. It was reported that out of 60,000 fighting men only 500 remained. The women and children, used for money, and Cæsar restored to them their territory and towns. The Atrebaeti were the descendants of a body of Cimbræ and Teutones, who had settled towards the confluence of the Sabis and the Mosæ. While on their march to support the Nervii, they heard of the total defeat of their allies, upon which they retired to a strong natural hold, where they were regularly besieged by Cæsar, who formed a line of circumvallation. When they saw the moveable towers and the battering ram approaching their walls, engines of which the Gauls had no idea, they sued for peace. Cæsar required them to throw their arms outside of their ramparts. They did so, but concealed a third of them; they then opened their gates and mixed with the Roman soldiers. On the evening Cæsar withdrew his men within his lines, but at midnight the Atrebaeti came out in arms and attempted to scale Cæsar's entrenchments. Being repulsed with great loss, their place was entered the next day, and the people were sold as slaves to the number of 53,000.

Crassus, being detached by Cæsar across the Sequana into Western Gaul, received the submission of the Auleri, Unelli, and Veneti, and other maritime people on the coasts of the ocean; and as the season was growing late, the army went into winter-quarters in the country of the Carnutes (about Orléans), Turones (Tours), and other parts of central Gaul. Cæsar set off, according to his custom, for Cisalpine Gaul, where his friends soaked from Rome to congratulate him on his successes. The senate, on receiving from the victorious general the usual official letters, ordered fifteen days of public thanksgiving to the gods, a period never granted before for any other general.

Cæsar's third campaign (B.C. 56) was against the Western Gauls.

Crassus, while wintering with one legion among the Andes (Anjou), sent tribunes and other officers to the Veneti (Vannes in Brittany) and other people on the Atlantic coast to ask for provisions. The Veneti, a powerful commercial seafaring people, who had numerous ships in which they traded with Britain and other countries, having recovered from the alarm of Cæsar's conquests, arrested the officers of Crassus, and refused to give them up until their own hostages were restored. All the neighbouring maritime tribes made common cause with the Veneti. Cæsar immediately ordered galleys to be constructed on the Ligeris (Loire), and sent also to collect ships on the coast of the Platonos and Santones (Poitou and Saintonge), who were friends with Rome. He directed the fleet to attack the Veneti by sea, while he marched against them by land. He exclaimed loudly against the breach of treaties, and the arrest of the Roman officers after the Veneti had made submission and given hostages, while he acknowledges in his 'Commentaries' that he was afraid other nations would follow the example, "knowing that it is the nature of all men to love liberty and hate servitude." This was a critical time for the Roman general; but his presence of mind never forsook him in difficulties. He sent Labienus towards the Rhine to watch the Belgians and Germans, Crassus into Aquitania, gave the command of the fleet to Decimus Brutus, and himself marching against the Veneti, took several of their towns on the coast. But he soon found that by means of their ships they easily moved from one point to another, and that the only way to conquer them effectually was by sea. The description of the ships of the Veneti, their naval tactics, their habits and modes of life, is one of Cæsar's most interesting sketches. A great naval battle, which lasted all day, ended with the destruction of the fleet of the Veneti, to the number of above 200 ships. Cæsar, determining to strike terror into the neighbouring people, put to death all the senators or chief men of the Veneti, and sold the rest as slaves. The Unelli (in the neighbourhood of Cherbourg) were likewise conquered by Titurius Sabinus; and Crassus defeated the Aquitanians, though with considerable difficulty, and received hostages from various tribes of that remote region. Cæsar himself marched against the Morini and Menapii (Boulogne, Calais, &c., and further to the north and east), but the rainy season setting in the soldiers could no longer remain under tents, and accordingly, after ravaging the country, he placed his troops for the winter among the Auleri, Lexovii, &c. (Normandy). It would appear by the following book (iv. 6) that he went as usual to pass the winter in North Italy. (Compare also v. 53.)

The following year, B.C. 55, Pompeius and Crassus being consuls, two German tribes, the Usipetes and the Tenchteri, being harassed by the Suevi, crossed the Rhine near its mouth into the country of the Menapii, between the Mosæ and the Salsus (Scheldt). Cæsar gives an interesting account of the Suevi, the principal German nation with which the Romans were then acquainted. Being resolved to check any disposition on the part of the Germans to cross the Rhine, he set off for the army earlier than usual. He found, as he suspected, that several Gaulish nations had an understanding with the Germans. The Usipetes sent to ask permission to settle in Gaul. Cæsar answered that there was no vacant place in Gaul for fresh emigrants, but that if they chose to settle among the Ubii on the banks of the Rhine, who were themselves at war with the Suevi, he would employ his good offices for the purpose. While negotiations were going forward, Cæsar's Gaulish cavalry, 5000 strong, was suddenly attacked near the banks of the Mosæ by 800 German horsemen, and, as usual, routed. The next day a number of German chiefs and elders came to Cæsar's camp to apologise for the fray. Cæsar arrested them all, and immediately marched against their camp, which being thus surprised and unprepared was easily entered, when the Romans made a dreadful carnage of the Germans. The survivors fled as far as the confluence of the Mosæ and the Rhine, where most of them perished. This was the action about which Cato exclaimed so loudly against Cæsar in the Roman senate.

The Ubii being annoyed by the Suevi appealed to Cæsar, and offered him boats to cross the Rhine. Declining this offer, he constructed a bridge by means of piles driven in the bed of the river. He gives a minute description of the process of building the bridge (iv. 17). It was finished in ten days, when Cæsar marched across, ravaged the country of the Sicambri, and reassured the Ubii by his presence. Hearing that the Suevi had assembled all their forces in the interior of their country, and considering "he had done all that the honour and interest of Rome required," he re-crossed the Rhine, after spending eighteen days on German ground.

He next made his first expedition into Britain. [BRITANNIA, in GEOGRAPHICAL DIVISION.] On his return he chastised the Morini, who had attacked some of his detachments, put his troops into winter quarters in Belgic Gaul, and then repaired to Cisalpine Gaul, as usual. In this year Cæsar's period of government was extended for five years more by a *Senatus Consultum*.

The next year, B.C. 54, Cæsar, after making an excursion into Illyricum, which formed also part of his government, returned into Gaul, where he had ordered a fleet to assemble at Portus Itius (between Boulogne and Calais) for a second attempt upon Britain. Meantime he visited the Treviri, the most powerful nation in cavalry of all Gaul. A dispute had arisen between Indutiomarus and Cingetorix about the supreme authority: Cæsar, knowing Cingetorix to be well disposed to

the Romans, supported his claims. This took place just before the expedition to Britain. On his return from Britain he repaired to Samarobriua (Amiens), where he held a council of the Gaulish deputies. On account of the bad harvest and scarcity of provisions, he was obliged to disperse his legions in various parts of the country for the winter. This proved nearly fatal to the Roman arms. He himself remained in Belgic Gaul to see his legions properly quartered. A fortnight only had elapsed when the Eburones (Tongres), excited by Induciomarus, revolted and attacked the camp of Titurius Sabinus and L. Cotta, who had one legion and five cohorts with them. Ambiorix, king of the Eburones, alarmed Sabinus by telling him that the whole country was in arms, and that the Germans were coming. Much against Cotta's opinion, Sabinus resolved on retiring towards the next Roman garrison, which was exactly what Ambiorix wished. The Romans were attacked on their march by numerous forces, surrounded, and all cut to pieces. Ambiorix, elated with this success, next attacked the camp of Quintus Cicero, brother to the orator, who was stationed with one legion in the country of the Nervii. Quintus made a brave defence. After several days' siege, the Gauls threw combustibles into the camp and set fire to the huts of the soldiers, which were thatched after the Gaulish fashion. At the same time the Gauls advanced to scale the ramparts; but the legionaries stood firm at their post, and Cæsar, having at last received news through a Gaulish slave of the danger of his men, marched with two legions to their relief, defeated the Gauls, and entered Cicero's camp, where he found not one tenth of the soldiers free from wounds. He praised Cicero, he praised the men, he spoke of the catastrophe of Sabinus and Cotta as a consequence of imprudence, and a lesson to other commanders. He then resolved to pass the winter in Gaul, and stationed himself with three legions at Samarobriua. Induciomarus, having attacked Labienus, was defeated and killed.

The following year, B.C. 53, which was the sixth of Cæsar's government, symptoms of general disaffection manifested themselves throughout Gaul. The people had been overawed but not subdued. The harshness and rapacity of the conquerors made the Gauls wish to shake off the yoke; but all their attempts were detached, partial, and not combined, and they failed, after giving however full employment to the Romans. It was a year of desultory though destructive warfare. Cæsar obtained of Pompey the loan of one legion, and had recruited two legions more in the Cisalpine province. He had now ten legions (60,000 men) under his orders, which was considered a very large Roman army. He first defeated the Senones, the Nervii, and the Menapii: the Treviri were defeated by Labienus. Cæsar then crossed the Rhine again from the country of the Treviri, having constructed a new bridge a little below the former one. He expected that the Suevi would attack him, but that wary people withdrew inland to the entrance of the great forest called Bacenis (the Harz?), which lay between their territory and that of the Cherusci, and there waited for Cæsar to advance. But the Roman avoided the snare, and withdrew his army across the Rhine, leaving part of the bridge standing for a future occasion. He then marched against Ambiorix and the Eburones, who did not wait for him, but took refuge in the forests and marshes, where they kept up a partisan or guerrilla warfare. Cæsar ordered the country of the Eburones to be thoroughly devastated, and invited the neighbouring tribes, Germans and Gauls, to assist in the work of destruction. One German tribe however, the Sicambri, who had crossed the Rhine for the purpose of booty, thought it expedient to attack the camp of Quintus Cicero, which they had nearly forced. Ambiorix escaped, notwithstanding all endeavours to seize him; but sentence of death was passed against Acco, the leader of the previous revolt of the Senones. His accomplices, who had escaped, were banished. Having put his legions to winter among the Treviri, Lingones, and Senones, Cæsar repaired to Cisalpine Gaul.

The disturbances which occurred at Rome in consequence of the murder of Clodius made Cæsar turn his attention towards that quarter. He raised troops in every part of the Cisalpine province. These rumours spreading among the Transalpine Gauls, exasperated as they were by the execution of Acco and Cæsar's fearful vengeance upon the Eburones, they thought the time was come for one great effort while Cæsar was engaged in Italy. The Carnutes began by massacring all the Romans whom they found in the town of Genabum (Orléans). Vercingetorix, a young man of one of the first families of the Arverni, was placed at the head of a confederacy of the whole of Celtic Gaul. The Bituriges joined the league, and the Ædui themselves wavered in their allegiance. Cæsar hearing this news, and seeing that the affairs of Rome had through Pompey's influence assumed a quieter aspect, set off in the middle of winter (beginning of B.C. 52) for the province of Ulterior Gaul, repaired to Narbo, which was threatened by the Gauls, and having collected some troops, crossed the Cebenna and spread alarm through the country of the Arverni, who hastily recalled Vercingetorix to their defence. Having thus effected his object of causing a diversion, Cæsar moved quickly northward to the country of the Lingones, whence he went among the Carnutes, attacked and took Vellaunodunum, Genabum, and Noviodunum. Vercingetorix in a great council of the chiefs advised, as the only means of harassing the Romans, to burn and destroy the whole country around them. This was executed in the country of the Bituriges, the villages and towns of which were set on fire except the town of Avaricum (Bourges),

which was garrisoned by the Gauls. Cæsar laid siege to Avaricum, and took it after a most brave defence, when the Roman soldiers killed all—old men, women, and children. The next siege was that of Gergovia (near Clermont, in Auvergne), which, after a murderous attempt to storm the place, Cæsar was obliged to raise. The Ædui, till then the firmest allies of Rome, had now thrown off the mask, joined the league, massacred the Romans at Noviodunum (Nevers), and seized the depôts, the baggage, and the treasury, which Cæsar had deposited there. Cæsar's next movement was to the north into the country of the Senones, in order to join Labienus and the legions under him. The defection of the Ædui rendered Cæsar's position in the centre of Gaul very difficult. Having effected a junction with Labienus, he directed his march towards the Lingones and the Sequani. Meantime he was enabled to collect a body of German cavalry from beyond the Rhine, which was of the greatest service to him during the rest of the campaign. Vercingetorix, who followed Cæsar closely, had his cavalry defeated by these new auxiliaries of the Romans, upon which he retired to Alesia (now a village called St-Reine, and also Alise, near Flavigny and Semur in North Burgundy, ten leagues north-west of Dijon). Cæsar immediately invested the place, and began his lines of circumvallation. For this celebrated siege of Alesia we must refer to Cæsar's own account. The whole forces of the Gallic confederation, stated at about 800,000 men, advanced to the relief of Alesia. Cæsar found himself besieged in his own lines, having to fight Vercingetorix from within, and the confederates from without. After a desperate battle, in which the Gauls penetrated into the Roman entrenchments, they were at last repulsed by Cæsar, who was well supported by his lieutenant Labienus. The Gaulish confederates, having sustained a tremendous loss, broke up the camp and returned home. Next day Vercingetorix assembled his council in Alesia, and offered to devote himself to save their lives by giving himself up to Cæsar. Alesia surrendered, and Vercingetorix was afterwards taken to Rome. Several years later he walked before the triumphal car of the conqueror; after which he was put to death in prison.

The Ædui and the Arverni now made their submission to Cæsar, who took their hostages, and restored their prisoners. After putting his army into quarters, he stationed himself at Bibracte for the winter. This was the hardest fought campaign of all the Gallic war.

Cæsar's eighth and last campaign in Gaul (B.C. 51) is related by Hirtius, who has continued his 'Commentaries' by writing an eighth or supplementary book. After the great but unsuccessful exertions of the Gauls in the preceding year their spirit was broken, but they still made some expiring efforts. Cæsar easily defeated the Carnutes, where his soldiers made an immense booty. He had more trouble with the Bellovaci (Beauvais), a Belgic nation, who at last submitted and gave hostages, all except Comius, the chief of the Atrebatæ, who had once been a friend to Cæsar. He had joined in the general revolt of the preceding year, in consequence of his life having been attempted by Labienus, who sent to him Volusenus Quadratus under pretence of a conference, but in reality with orders to kill him. During the interview a centurion of Volusenus's escort struck Comius and wounded him on the head, when the Gaulish escort interposed and saved Comius's life. From that time Comius swore he would never trust himself to a Roman. This disgraceful transaction, not mentioned by Cæsar, is related by Hirtius ('Bell. Gall.', b. viii. 23). A revolt in western Gaul was quelled by C. Fabius, who subjugated all Armorica (Hirtius, 31). Gutruatus, chief of the Carnutes, who had joined in the revolt, was taken to Cæsar's camp, whipped with rods till he fainted, and then beheaded. Hirtius says that this inhuman act, repugnant to Cæsar's nature, was forced upon him by the clamour of his soldiers. Cæsar next besieged and took Uxellodunum, a stronghold of the Caduroi (Cahors). Here Cæsar's clemency, which Hirtius repeatedly extols, did not prevent him from sentencing all the men who had shared in the defence of Uxellodunum to have their hands chopped off. Cæsar entered Aquitania, the people of which gave hostages. Thence he repaired to Narbo, and there distributed his army in winter-quarters. He placed four legions among the Belgæ under M. Antonius (afterwards the celebrated triumvir), Trebonius, Vatinius, and Q. Tullius Cicero; two among the Ædui, two among the Turones, and two among the Lemovices, near the borders of the Arverni. He then visited the Provincia, held the courts, distributed rewards, and went to winter at Nemetocenna (Arras), then within the limits of the country called Belgium. During the winter he endeavoured to heal in some measure the wounds which he had inflicted upon the unfortunate countries of Gaul. He endeavoured to conciliate the principal inhabitants by great rewards, treated the people with kindness, established no new taxes, and by rendering the Roman yoke smooth and light he succeeded in pacifying Gaul, exhausted as it was by so long and so unfortunate a struggle.

In the spring of B.C. 51 Cæsar set off for Italy, where he was received by all the municipal towns and colonies of his government with great rejoicings. On his return to Belgic Gaul he reviewed his troops, and soon after returned to the north of Italy, where the dissensions between him and the senate had begun which led to the civil war. This was the ninth and last year of Cæsar's government of the Gauls.

Before the close of his Gallic campaign, Cæsar had probably determined not to divest himself of the command of his army. He feared, and apparently with good reason, that if he were once in the power

of his enemies at Rome his life would be in danger. His connection with Pompey had been dissolved by the death of Julia without any corresponding feelings, and by the growing jealousy and fear with which his success in Gaul and his popularity with his army had filled all the aristocratic party. Caesar's object now was to obtain the consulship at a second time, and a special enactment had been already passed enabling him to stand for the consulship in his absence; but Pompey, who at last was roused from his lethargy, prevailed upon the Senate to require him to give up the command of the army, and come to Rome in person to be a candidate. Caesar, who was now at Ravenna in his province of Gallia Cisalpina, sent Curio to Rome with a letter expressed in strong terms (Cic. 'Ep. ad Div.' xvi. 11), in which he proposed to give up his army and come to the city, if Pompey would also give up the command of the troops which he had. These troops of Pompey comprised two legions which had been taken from Caesar, and by a decree of the Senate were designated for the Parthian war, but had been illegally put into the hands of Pompey by Marcellus the consul. The Senate, acting under the influence of Pompey and Metellus Scipio, whose daughter Pompey had married, passed a decree that Caesar should give up his army by a certain day, or be considered an enemy to the state. The tribunes, M. Antonius and Q. Cassius, the friends of Caesar, attempted to oppose the measure by their 'intercessio,' which was perfectly legal; but their opposition was treated with contempt, and thus they gained, what they were probably not sorry to have, a good excuse for hurrying to Caesar with the news. (Cic. 'Ep. ad Div.' xvi. 11.) Upon receiving the intelligence Caesar crossed the Rubicon, a small stream which formed the southern limit of his province, and directed his march towards the south. The city was filled with confusion—councils were divided and hesitating—and Pompey, who was the commander-in-chief on the side of the Senate, was unprovided with troops to oppose the veterans of the Gallic wars. Domitius, who had thrown himself into Corfinium to defend the place, was given up to Caesar by his soldiers, who joined the invading army. The alarm now became still greater, and it was resolved by the senatorial party to pass into Greece, and for the present to leave Italy at the mercy of Caesar's legions. Pompey, with a large part of the Senate and his forces, hurried to Brundisium, whence he succeeded in making good his escape to Dyrrachium in Epirus, though Caesar had reached the same place days before Pompey left it.

From Brundisium Caesar advanced to Rome, where he met with no opposition. The Senate was assembled, with due regard to forms, to pass some ordinances, and there was little or nothing to mark the great change that had taken place, except Caesar's possessing himself of the public treasury, which the other party in their hurry had left behind. His next movement was into Spain, where Pompey's party was strong, and where Afranius and Petreius were at the head of eight legions. After completely reducing this important province, Caesar, on his return, took the town of Massilia (Marseille), the siege of which had been commenced on his march to Spain. This ancient city, the seat of arts and polite learning, had professed a wish to maintain a neutral position between the two rival parties ('Bell. Civil.' l. 35) and their respective leaders. We might infer from one passage in Strabo, that Marseille suffered severely either during or immediately after the siege (Strabo, p. 180); but another passage seems to imply that the conqueror used his victory with moderation. (Strabo, pp. 180, 181.)

The title of Dictator was assumed by Caesar on his return to Rome; but he made no further use of the power which it was supposed to confer than to nominate himself and Servilius consuls for the following year (B.C. 48). The campaign of the year B.C. 48 completed the destruction of the senatorial party. It is given at length in the third book of the 'Civil Wars' (where however there appears to be a considerable lacuna), and comprises the operations of Caesar and Pompey at Dyrrachium near Durrës, and the subsequent defeat of Pompey on the great plain of Pharsalus, in Thessaly. Surrounded by nearly 200,000 men, who acted like a controlling council, with an army mainly composed of raw, undisciplined recruits, the commander-in-chief, whose previous reputation was more due to fortune than to merit, was an unequal match for soldiers hardened by eight years' campaigns, and directed by the energies of one skilled general. It seems difficult to comprehend the movements of Pompey after the battle. He turned his face to the east, once the scene of his conquests, but he had no friends on whom he could rely, and instead of going to Syria, as he at first intended, he was compelled to change his course, and accordingly he sailed to Rhodes, in the Delta of Egypt. Caesar, who had pursued him with incredible celerity ('Bell. Civil.' iii. c. 102), arrived a little after Pompey had been treacherously murdered by Achillas, the commander of the troops of the young king Ptolemy, and L. Septimius, a Roman, who had served under Pompey in the war with the pirates. Pompey was fifty-eight years old at the time of his death.

The events which followed the death of Pompey need only be rapidly glanced at. The disputes in the royal family of Egypt and the interference of Caesar brought on a contest between the Romans and the king's troops, which ended in a new settlement of the kingdom by the Roman general. (See the book on the Alexandrine war.) Here Caesar formed his intimacy with Cleopatra, then in her twenty-third year. Cleopatra afterwards followed him to Rome, where she was living at the time of Caesar's death. [CLEOPATRA.] Early in the following year (B.C. 47), Caesar marched into the province of Pontus,

and entirely defeated Pharnaces, the son of Mithridates, who had exercised great cruelties on the Roman citizens in Asia. He returned to Italy in the autumn, by way of Athens. At Brundisium he was met by Cicero (Plut. 'Cic.' 39), who was glad to make his peace, and had no reason to be dissatisfied with his reception. On his return to Rome, Caesar was named Dictator for one year, and consul for the following year, with Lepidus. During the winter he crossed over into Africa, where the party of Pompey had rallied under Scipio, gained a complete victory at the battle of Thapsus, and was again at Rome in the autumn of B.C. 46. In the year B.C. 45, Caesar was sole consul, and Dictator for the third time. During the greater part of this year he was absent in Spain, where Cn. Pompey, the son of Pompey the Great, had raised a considerable force, and was in possession of the southern part of the peninsula. The great battle of Munda, in which 20,000 men are said to have fallen on the side of Pompey, terminated the campaigns of Caesar. Pompey was taken after the battle, and his head was carried to Caesar, who was then at Hispalis (Seville).

On his return to Rome, Caesar was created consul for ten years, and Dictator for life. On the Ides (15th) of March, B.C. 44, he was assassinated in the senate-house. [PLOTUS.] After his death he was enrolled among the gods (Sueton. 'Cæsar,' 88), under the appellation of 'DIVVS IVLIVS,' as appears from his medals.

British Museum. Actual size. Bronze. Weight 547½ grains.

Caesar did not live long enough after acquiring the sovereign power to rebuild the crazy fabric of Roman polity which he had demolished in fact though not in form. But a state which had long been torn in pieces by opposing factions—whose constitutional forms served rather to cherish discord than to promote that general unity of interests without which no government can subsist—where life and property were exposed to constant risk—could find no repose except under one head. A bloody period followed the death of Caesar, but the fortune of his name and family at last prevailed, and Rome and the world were happier under the worst of his successors than during the latter years of the so-called republic.

The energy of Caesar's character—his personal accomplishments and courage—his talents for war—and his capacity for civil affairs—combine to render him one of the most remarkable men of any age. Though a lover of pleasure, and a man of licentious habits, he never neglected what was a matter of business. He began that active career which has immortalised his name when he was forty years of age—a time of life when ordinary men's powers of enterprise are commonly deadened or extinguished. As a writer and an orator he has received the highest praise from Cicero; his 'Commentaries,' written in a plain perspicuous style, entirely free from all affectation, place him in the same class with Xenophon and those few individuals who have successfully united the pursuit of letters and philosophy with the business of active life. His projects were vast and magnificent; he seems to have formed designs (Suetonius, 'Cæsar' 44) far beyond what the ability of one man could execute, or the longest life could expect to see realised. His reform of the Roman calendar, under the direction of Sosigenes, and his intended consolidation of the then almost unmanageable body of Roman law, do credit to his judgment. He established public libraries, and gave to the learned Varro the care of collecting and arranging the books. Of the eight books of his 'Commentaries' the last is said to have been completed by some other hand. The three books of the 'Civil War' were written by Caesar; but the single books on the 'Alexandrine, African, and Spanish wars,' respectively, are generally attributed to another hand, though it is not at all unlikely that Caesar left the materials behind him. He wrote a number of other things, the publication of which Augustus suppressed. The editions of the 'Commentaries' are very numerous; the best is that of Oudendorp, Leiden, 1757, 4to. They have been frequently translated into Spanish, French, English, Dutch, German, and Italian. The Greek translation of seven books of the 'Gallic War,' attributed to Planudes, was first printed in Jungermann's edition, Frankfurt, 1806, 4to.

CÆSIUS BASSUS, a Roman lyric poet, who lived in the reign of Nero and Vespasian. Persius addressed his sixth satire to him. Quintilian (x. 1) speaks of him as perhaps next, but still very inferior to Horace. The Scholiast on Persius (Sat. vi. 1) says that he was burnt with his house in an eruption of Mount Vesuvius. Only two lines of his poetry are preserved: one by Priscian (x. p. 897, ed. Putsch.); the other by Diomedes (iii. p. 513, ed. Putsch.).

CAGLIA'RI, or CALIA'RI, PAOLO, called PAOLO VERONESE, from the place of his birth, was the most eminent master in what may be termed the ornamental style of painting. He was born at Verona, in 1532 according to Ridolfi, but more probably in 1530; Zanetti says 1532. His father, Gabriele Cagliari, was a sculptor, and originally intended his son for his own profession; but in consequence of the boy's determined preference for the sister art, he was placed under his uncle, Antonio Badile, to be taught painting. He improved rapidly, and very early in his life enjoyed an extensive and profitable patronage.

While yet young he visited Venice, where he was commissioned to execute some paintings in the church and sacristy of St. Sebastian. The pictures excited universal admiration, from the originality of the style and the vivacity of the design. Commissions for oil paintings poured in upon him, and a portion of the walls of the ducal palace was allotted to him for embellishment. From this time his fame and wealth increased rapidly.

He subsequently went to Rome; and in the course of his life visited numerous towns of his native country, in which he left behind him many lasting memorials. He was so well satisfied with his honours and emoluments at home, that he declined accepting the invitation of Philip II. to visit Spain, and contribute some works to the Escorial. He lived a life of uninterrupted labour and success, and died at Venice in April 1588, leaving great wealth to his two sons, Gabriele and Carlo, who were also his pupils. They did not however attain their father's celebrity. Carlo died young. Gabriele is said to have abandoned painting for mercantile pursuits. Paolo had a brother, Benedetto Cagliari, who was a sculptor, but also practised painting: some of the fine architectural back-grounds which adorn the pictures of Paolo are attributed to him.

Paolo Veronese ranks among the greatest masters of the art, especially as a colourist. His colouring is less true to nature than Titian's, and less glowing in the tints; but is rich and brilliant, and abounds in variety and pleasing contrast. His style is florid and ornate, his invention easy and fertile, and his execution characterised by a masterly facility. His principal works are at Venice, but his productions are to be met with in most collections. One of his finest works, the 'Marriage at Cana,' is in the Louvre. Our own National Gallery contains two very excellent works by him.

CAGLIOSTRO, ALEXANDER, commonly called COUNT DE, one of the most impudent and successful impostors of modern times. His real name was Joseph Balsamo, and he was born at Palermo on the 8th of June 1743. His friends designed him for the monastic profession, but during his novitiate he ran away from his convent, and thenceforward lived upon his wits and the credulity of mankind. The first exercise of his ingenuity, in a public way, was to forge tickets of admission to the theatres. He then proceeded to forge a will, and having robbed his uncle, and being accused of a murder besides, he was thrown into prison. He was liberated, again imprisoned, and again set free; but was finally obliged to fly from Sicily for cheating a goldsmith of a large sum of money under pretence of showing him a hidden treasure. He went successively to Alexandria, Rhodes, Malta, Naples, Rome, and Venice, at one of which places he married a woman whose great beauty and profound immorality were very useful to him.

Quitting Italy this couple visited Holstein, where Cagliostro professed alchemy; and thence they went to Russia, Poland, &c. In 1780 they fixed themselves at Strasbourg, where the *soi-disant* count practised as a physician, and pretended to the art of making old women young. As his handsome wife, who was only twenty, vowed she was sixty, and had a son, a veteran captain in the Dutch service, they for a time obtained a good deal of practice among the old women of Strasbourg. Thence they went to Paris, where Cagliostro exercised the profitable profession of Egyptian free-masonry (as he called it), and pretended to show people the ghost of any of their departed friends. In 1785 he was deeply implicated with the Cardinal Duke de Rohan in the notorious affair of the diamond necklace in which the name and fame of Marie Antoinette, the unfortunate queen of France, were committed. Cagliostro was, in consequence, shut up for nine months in the Bastille; and on his expulsion from France, he proceeded to England, where, during a stay of two years, he found no lack of credulity. What took him again to Rome we know not, but in December 1789, he was arrested in that city, imprisoned in the castle of Sant' Angelo, and after a long trial condemned to death for being — a freemason. (See 'Process,' &c., published at Rome—a very curious document.) His severe sentence was commuted to perpetual imprisonment, and he was transferred to the fortress of San Leo, where he died in 1795. His wife was also arrested, and condemned to pass the remainder of her life in a convent: she survived her husband several years.

CAGNOLA, LUIGI, MARQUIS, one of the most distinguished Italian architects of the present century, was born at Milan in 1762, of an ancient patrician family. At the age of fourteen, Luigi was sent by his father, the Marchese Gertano Cagnola, to the Clementine College at Rome, and thence in 1781 to the university of Pavia, in order to study jurisprudence; but, although he was far from neglecting his studies, his passion for architecture was insuperable, and he resolved to devote himself exclusively to that art, notwithstanding that profes-

sional practice in it was deemed somewhat derogatory in one of his rank and station. For a while Cagnola held some official posts in the civil government of Milan; but at length ventured to put forth three different designs for the Porta Orientale, then about to be erected at Milan. Cagnola's designs were approved, but that by Piermarini was adopted, as being more economical. He now engaged the services of a clever artist, named Aurelio, and undertook a series of illustrations of the ancient baths of Maximian, near the church of San Lorenzo, published under the title of 'Antichità Lombardico-Milanesi;' and he was afterwards employed by the government (1812) to secure from further ruin the sixteen noble Corinthian marble columns which constitute the chief remains of that monument of antiquity. The death of his father, in 1799, devolved upon Cagnola an important share in public affairs, when, besides being one of the state council, he was attached to the army commissariat in the Austrian service. On the change of the government by the establishment of the Cisalpine Republic, he withdrew from Milan, and spent about two years at Verona and Venice, fully occupied in studying the architectural treasures of those cities. Soon after his return, he erected in 1802 a noble villa for the brothers Zurla, at Crema, near Vajano; and about the same period designed the magnificent 'catafalchi' for the funeral obsequies of Archbishop Vicenti, the Patriarch Gamberi, and Count Anguissola, published in folio, 1802. On the marriage of the Viceroy Eugène Beauharnois with the Princess Amelia of Bavaria in 1806, he was called upon to erect another grand temporary structure; but such was the admiration excited by the arch constructed of wood on that occasion, that it was determined to perpetuate it in marble. Accordingly, the first stone of the Porta del Sempione, or, as it is now called, the Arco della Pace, was laid October 14, 1807. The political changes which afterwards took place threatened to put a stop to the work altogether, when it was not advanced beyond the piers of the arches. Almost the idea of its being ever completed had been abandoned, when, on his visit to Milan, the emperor Francis I. of Austria, ordered the works to be resumed; and from that time they were prosecuted without interruption, so that Cagnola saw the whole structure very nearly terminated before his death. With the exception of the Arc de l'Etoile at Paris, the Arco della Pace is by far the largest as well as most magnificent structure of the kind in modern times, and in its general mass it is equal to, even if it does not somewhat exceed, the largest of the ancient—the Arch of Constantine; it being 78 feet English wide, as many high, and about 27 feet deep.

Another public monument by him at Milan, which is greatly admired, is the Porta di Marengo, otherwise called Porta Ticinese, an Ionic propylæum, whose two fronts consist of a distyle in antis, consequently of three open intercolumns, and the two sides or ends are filled in with an open arch.

The Campanile at Ugnano in the Bergamasque territory, begun in 1824 and finished in 1829, exhibits more of design and composition than the preceding. It is a circular tower of three orders, Doric, Ionic, and Corinthian, upon a square rusticated basement, each order consisting of eight half-columns, and between those of the Corinthian order are as many open arches. Above this last rises an additional order of Caryatid figures supporting a hemispherical dome: the entire height from the ground is 68 metres, or 190 English feet. The elevation of this Campanile is engraved in the 'Ape delle Belle Arte,' Rome, 1835. Among other works executed by Cagnola are the chapel of Santa Marcellina in the church of San Ambrogio, at Milan; the church at Concorrezzo; the façade of that at Vivallo; and the church at Ghisalba in the Bergamasque. This last, which was not completed till after his death, in 1835, is his noblest work of the kind, and is a rotunda of the Corinthian order, with a portico of fourteen columns. The interior has sixteen columns of the same order. Besides those which were carried into execution, Cagnola produced a great number of designs and *projects*, in several of which he gave such free scope to his invention and *grandezza* of ideas, as to render their adoption hopeless; such, for instance, was that for an Hospitium on the summit of Mount Cenis, with no fewer than 110 columns 11 English feet in diameter—to which may be added his designs for a senate-house and a magnificent triumphal bridge. He also indulged his taste without regard to cost in improving or nearly rebuilding his villa at Inverigo near Milan, which occupied him during the last years of his life, and which he directed to be completed by his widow.

Cagnola died of apoplexy, August 14th, 1838, at the age of seventy-one. There is a portrait of him in Förster's 'Bauzeitung' for 1838, with an accompanying memoir, to which we are indebted for some of the particulars in this article.

CAGNOLI, ANTONIO, born at Zante, September 29, 1743. He was attached to the Venetian embassy at Paris, and formed a taste for astronomy and an intimacy with Lalande. He built an observatory in the Rue Richelieu, and continued to make it useful till 1786, when he went to Verona, where he built another. This last was damaged by French cannon-shot in 1797, but the owner was indemnified by General Bonaparte, who removed him to Modena. He was afterwards president of the Italian Society, and died at Verona in August 1816. (Lalande, 'Bibliog. Astron.' p. 599.)

Cagnoli wrote a work on trigonometry, first published at Verona in Italian (1786), and translated into French by M. Chompré. The second edition of the translation bears Paris, 1808. Besides this he

wrote various astronomical treatises and papers, mostly in the memoirs of the Italian Society, which should be consulted from the beginning to find them. The title of these memoirs is 'Memorie di Matematica e Fisica della Società Italiana, Modena,' quarto.

Cagnoli's trigonometry is one of those invaluable works which bring up the state of a science completely to the time at which it is written, and furnish those who want the means of application with varied stores of methods. Elementary writers on the practical parts of mathematics are among the last to adapt their rules to the actual state of science, unless somebody, who is well versed in the theory, performs the service which Cagnoli did for trigonometry. The consequence has been, that works on that subject have assumed a better form, and the constant reference which has been made to Cagnoli's treatise is the test of the frequency with which it has been used. The late Professor Woodhouse, whose treatise on trigonometry has powerfully contributed to foster a taste for analysis in this country, seems, on a smaller scale to have taken Cagnoli for his model. The work we speak of is a quarto of 500 pages (in the French translation, the second edition of which is augmented by the author's communications), and treats very largely of the application of trigonometry to astronomy and geodesy.

*CAHEN, SAMUEL, was born on the 4th of August, 1796, at Metz, the capital of the French department of Moselle. His parents were Jews, and he was destined by them for the rabbinate, or learned profession. At the age of fourteen he was sent to Mainz, in order to complete his studies under the chief rabbi of that city. After passing some time in Germany as a private teacher, he returned to France, and in 1822 fixed his residence in Paris, where, from 1823 to 1836 he was the conductor of the Jewish consistorial school of that city. In 1824 he published at Paris a 'Cours de Lecture Hébraïque, ou Méthode Facile pour apprendre seul et en peu de Temps à lire l'Hébreu' (2nd edition, 1842); and in 1836 a 'Manuel d'Histoire Universelle depuis le Commencement du Monde jusqu'en 1836.' In 1840 he commenced the monthly periodical called 'Archives Israélites de France'; and in 1842 published at Metz 'Exercices Élémentaires sur la Langue Hébraïque'; but his great work is the translation of the Old Testament into French, 'La Bible, Traduction Nouvelle, avec l'Hébreu en regard' (with the Hebrew on the opposite pages), 20 vols. 8vo, which occupied him from 1831 to 1851.

CAILLET, GUILLAUME, a French peasant, was the leader of the insurrection called the Jacquerie, which broke out in France in 1358. Caillet was a native of Mello, a small place in the Beauvoisin, a district so named from the city of Beauvais, in the old province of Isle-de-France, adjoining Picardie. At this time the French king Jean II. was a prisoner in England, having been taken at the battle of Poitiers in 1356. The insurrectionists consisted almost entirely of peasantry, and their leader Caillet received or assumed the name of Jacques Bonhomme (James Good-Man), which was applied in contempt to the lower classes, and hence the persons engaged in this outbreak were called Jacques, and the insurrection itself La Jacquerie. The rising of the peasants commenced, according to the 'Chroniques de France,' on the 21st of May 1358, and was of a very ferocious character. It is stated by the writers of the time, Froissart and others, to have been caused by the oppressions of the feudal lords and landed gentry, which, always severe, had increased during the disturbed period of the king's captivity till they had become intolerable. The lawless bands were at first few in number, and were armed only with knives and with sticks shod with iron, but they rapidly increased, and ultimately extended throughout Picardie and into the neighbouring provinces, and are said to have amounted to 100,000. Their object was, as they openly professed, to destroy the whole race of the feudal nobility and gentry as beings who ought to be no longer suffered to exist. The peasants forced their way into the castles and houses, plundered and then burnt them, and not only massacred the inhabitants of both sexes and every age, but inflicted cruelties not fit to be described. At length, about the end of the same year 1358, the insurrectionists were opposed and overcome by the combined forces of the lords of Picardie, Brabant, and Flanders, having the Dauphin of France, afterwards Charles V., at their head. Caillet himself was taken prisoner by the king of Navarre, and was beheaded in 1359.

*CAILLIAUD, FRÉDÉRIC, was born in 1787 at Nantes, in the French department of Loire-Inférieure. In 1809 he removed to Paris for the purpose of prosecuting his studies in geology and mineralogy. He afterwards travelled in Holland, Italy, Sicily, Greece, and Turkey. In 1812 he visited Egypt, where he was well received by the pasha, Mohammed Ali, by whom he was employed on a voyage of exploration up the Nile. He spent some time in Nubia, and discovered on Mount Zaharah the emerald mines which had formerly been celebrated, and which had been wrought under the government of the Ptolemies. He explored the vast excavations which had been made in working the mines, and found large quantities of tools and other articles which had been used by the workmen, and left there. He himself conducted the mining operations for some time, and transmitted to the pasha ten pounds weight of emeralds. From communications with the Arabs he ascertained one of the lines of route from the Nile to the Red Sea by which the commerce between Egypt and India was formerly carried on. He visited the ruins of Thebes several times, and obtained many interesting antiquities, and copied a large number of inscriptions.

M. Cailliaud returned to Paris in 1819, but went back to Egypt before the end of the same year for the purpose of extending his travels. He left his journals, portfolios, and other materials, with M. Jomard, who was thus enabled to compile the 'Voyage à l'Oasis de Thèbes, et dans les Déserts situés à l'Orient et à l'Occident de la Thébaïde, fait pendant les Années 1815, 1816, 1817, et 1818,' 2 vols. folio, one of text and one of plates, Paris, 1821.

M. Cailliaud, after his return to Egypt, performed a difficult and exhausting journey across the desert which lies to the west of Egypt, as far as the oasis of Siwah, where he visited the remains of the famous temple of Ammon. He had been about four months employed here and in visiting the other oases of the desert, when he learned that the pasha was preparing an expedition to Upper Nubia, which was to be placed under the conduct of his son Ismail. M. Cailliaud immediately proceeded to Cairo, where he obtained the pasha's permission to join the expedition. He went with it as far as 10° N. lat., which was the farthest point south to which it advanced. M. Cailliaud is considered to have discovered at Assouf, above the confluence of the Taccazzé with the Nile, the ruins of the ancient city of Meroë. The pasha's son Ismail died here. In 1822 Cailliaud returned to Paris, and from the materials furnished by him M. Jomard compiled the 'Voyage à l'Oasis de Syouah,' 1 vol. folio, with many plates. The results however of these latter journeys were afterwards published by M. Cailliaud, himself, in the 'Voyage à Meroë, au Fleuve Blanc, au delà de Fazoql, dans le Midi du Royaume de Sennâr, à Syouah, et dans les Cinq autres Oases, fait dans les Années 1819, 1820, 1821, et 1822,' Paris, 1826-27, 4 vols. 8vo, with a folio volume of plates. In 1831 he published a splendid volume in small folio, with plates beautifully coloured, entitled 'Recherches sur les Arts et Métiers, les Usages, et la Vie Civile et Domestique, des Anciens Peuples de l'Égypte, de la Nubie, et de l'Éthiopie, suivies de Détails sur les Mœurs et Coutumes des Peuples Modernes des mêmes Contrées.' M. Cailliaud afterwards retired to his native town of Nantes, where, we believe, he is still living.

(Nouvelle Biographie Universelle.)

CAIN was the eldest son of Adam. His history, with that of his brother Abel, is contained in the fourth chapter of Genesis. Cain, we are told, was a tiller of the ground, while Abel was a keeper of sheep. The brothers offered sacrifices together. Cain's offering being the fruit of the earth, and that of Abel the firstlings of his flock. The offering of Abel alone was accepted, as being an act of faith [Abm.], and Cain being very wrath, when they were together in the field, "rose up against Abel his brother and slew him." For this, the first shedding of human blood, Cain was driven forth "a fugitive and a vagabond in the earth." But on his crying out to the Lord that his punishment was greater than he could bear, "the Lord set a mark upon him, lest any finding him should kill him,"—or, as it is perhaps to be understood, gave him a token or assurance that none who found him should kill him. Cain went and dwelt in the land of Nod on the east of Eden, and had a son, Enoch, after whom he named a city or settlement which he subsequently built. Of the remainder of Cain's life, or of its length, nothing is told in Scripture: the Talmudists and some early Christian writers have related many absurd fables and traditions respecting his future career and the manner of his death, which however it would serve no good purpose to repeat here. It will also be enough to mention that in the 2nd century of the Christian era, a sect of heretics, who called themselves, or were called, Cainites, is said by ancient writers to have sprung up and numbered many adherents. They are stated to have held the person of Cain in great veneration, and to have adopted many very abominable practices as well as opinions: they are regarded as a minor sect of Gnostics. Lardner gives an account of them in his 'History of Heretics,' but at the same time questions the existence of any such sect.

CAIUS. [GAIUS.]

CAIUS, DR. JOHN, was born at Norwich, October 6, 1510. His real name was Kays, or Key, which he Latinized by Caius. After receiving the first rudiments of learning in his native city, he was sent to Gonville Hall, in the University of Cambridge. He took the degrees of B.A. and M.A. at the usual times, and was chosen fellow of his college in 1533. His literary labours began at the age of twenty by a translation into English of St. Chrysostom, 'De Modo orandi Deum.' This was followed by a translation (somewhat abridged) of Erasmus, 'De verâ Theologia.' His third production was a translation of Erasmus's paraphrase upon the epistle of St. Jude. His excuse for writing in English is curious enough:—"These I did in English the rather because at that tyme men were not so geuen all to English, but that they dyd fauoure and maynteyne good learning continued in tongues and sciences, and did also study and apply diligently the same themselves. Therefore I thought no hurte done. Since that tyme diuerse other thynges I haue written, but with entente neuer more to write in the English tongue, partly because the commoditie of that which is so written pertaineth not the compass of Englande, but remaineth enclosed within the seas," &c. ('A Counsell against the Sweat,' fol. 4.)

It was probably soon after this that he travelled into Italy, where he remained several years. He studied medicine at Padua under Baptista Montanus and Vesalius, and took the degree of Doctor at Bologna. In 1542 he gave lectures at Padua on the Greek text of Aristotle in conjunction with Realdus Columbus, the salary being paid

by some noble Venetians. The following year he made the tour of Italy, visiting the most celebrated libraries, and collating manuscripts in order to improve the text of Galen and Celsus. At Pisa he attended the medical lectures of Matthæus Curtius, and then returned home through France and Germany. On his return he was incorporated Doctor of Physic at Cambridge, and practised with great distinction at Shrewsbury and Norwich. By the appointment of Henry VIII. he read lectures on anatomy to the Company of Surgeons; but he does not appear to have settled in London till a later period, when he was made physician to Edward VI. He retained his appointment under Mary and Elizabeth.

In 1547 Dr. Caius became a Fellow of the College of Physicians, and was ever a strenuous upholder of its rights and interests. A difference having arisen between the physicians and surgeons in the reign of Elizabeth as to whether the latter might administer internal remedies in cases where their manual assistance was required, Dr. Caius, then president, was summoned to appear before the lord mayor and others of the queen's delegates. On this occasion he pleaded the physicians' cause so ably that, although the surgeons were supported by the Bishop of London and the Master of the Rolls, it was unanimously agreed by the commissioners that it was unlawful for the surgeons to practise medically in such cases. Dr. Caius was president of the College of Physicians for more than seven years. He left behind him a book of the college annals, from 1555 to 1572, written with his own hand in a clear Latin style. Having obtained permission from Queen Mary, with whom he was much in favour, to advance Gonville Hall into a college, which still bears his name, he accepted the mastership of the college, and passed the last years of his life in it. Before his death he was reduced to a state of great weakness; and it appears from the following quaint passage in Dr. Mouffet's 'Health's Improvement, or Rules concerning Food,' that he attempted to sustain his flagging powers by reverting to the food of infancy:—"What made Dr. Caius in his last sickness so peevish and so full of frets at Cambridge, when he sucked one woman (whom I spare to name) froward of conditions and of bad diet; and, contrariwise, so quiet and well when he sucked another of contrary dispositions? Verily, the diversity of their milks and conditions, which being contrary one to the other, wrought also in him that sucked them contrary effects."

Dr. Caius died July 29, 1573, in the sixty-third year of his age, and was buried in the chapel of his own college. His monument bears the pithy inscription, 'Fui Caius.'

The most interesting of the works of Dr. Caius is his treatise on the sweating sickness. The original edition is a small black letter and extremely scarce duodecimo of thirty-nine folios, 'imprinted at London by Richard Grafton, printer to the kynges maiestie. Anno Do. 1552.' It is entitled 'A boke, or counsaill against the disease commonly called the sweate, or sweatyng sickness. Made by Jhon Caius, doctour in phisicke.' This was intended for the public in general; but in 1556 the author published it in an enlarged form, and in the Latin language, under the title 'De Ephemerâ Britannicâ.' The epidemic described by Caius was that of 1551, the fifth and last of the kind. It was an intense fever, of which the crisis consisted in a profuse perspiration. The death of the patient often followed two or three hours after this symptom, but if he survived the first attack of the disease twenty-four hours he was safe.

The works of Dr. Caius are exceedingly numerous, and display his talents as a critic, a linguist, a naturalist, and an antiquary, as well as a physician. His original works consist of treatises—"De Medendi Methodo," 'De Ephemerâ Britannicâ,' 'De Ephemerâ Britannicâ ad Populum Britannicum,' 'De Antiquitate Cantabrig. Academicæ,' 'De Historiâ Cantabrig. Academicæ,' 'De Canibus Britannicis,' 'De Rariorum Animalium atque Stirpium Historiâ,' 'De Symphonîâ Vocum Britannicarum,' 'De Thermis Britannicis,' 'De libris Galeni qui non extant,' 'De Antiquis Britannicis Urbibus,' 'De Libris propriis,' 'De Pronunciatione Græcæ et Latinæ Linguæ cum Scriptione Novâ,' 'De Annalibus Collegii Medicinæ Lond.,' 'De Annalibus Collegii Govevilli et Caii,' 'Compendium Erasmi Libri de verâ Theologiâ.' He also edited, translated, and commented upon many pieces of Hippocrates, Galen, and others. During his life, and for many years after his death, the writings of Dr. Caius were regarded with deep veneration. Several of his treatises were reprinted under the superintendence of Dr. Jebb, London, 1729, 8vo; and his treatise 'De Ephemerâ Britannicâ' was edited by Dr. J. F. C. Hecker, Berolini, 1833, 12mo.

(Hutchinson, *Biographia Medica*; Aikin, *Biographical Memoirs of Medicine in Great Britain*; Dr. J. F. C. Hecker, *Der Englische Schwelche*.)

C'ALAMIS, a very celebrated Greek sculptor, of the 5th century before Christ. Neither his native place nor the exact period of his career is known; he was however contemporary with Phidias, but probably his senior in years, as, according to Cicero and Quintilian, who probably expressed the general opinion, notwithstanding the general excellence of his works, there was a hardness in his style. He worked in various styles, in marble, in bronze, and ivory, and as an engraver in gold. He was also very famous for his horses, in which, Pliny says, he was without a rival.

Many works by Calamis are mentioned in ancient writers, Greek and Latin, but one in particular claims attention; this is the 'Apollo' of the Servilian gardens at Rome, mentioned by Pliny, and by some

supposed to be the 'Apollo Belvedere' of the Vatican at Rome. This supposition however completely sets aside the criticisms of Cicero and Quintilian upon the style of Calamis, for this work, so far from being hard, would be effeminately delicate for any male character below a divinity.

Calamis made two other statues of 'Apollo': the 'Apollo *Alexikakos*' ('Deliverer from Evil'), which Pausanias saw at Athens; and the colossal 'Apollo,' made for the city of Apollonia in Illyricum, and which, according to Strabo, was brought to Rome by Lucullus, and placed in the Capitol. Junius and Harduin supposed that Pliny and Pausanias speak of the same work; but it is not at all probable that a work which was in Rome in Pliny's time would be in Athens in the time of Pausanias. This inconsistency has been pointed out before; but many have been misled by the opinion, and it seems to have suggested the idea which Visconti and Flaxman have adopted, that the 'Apollo Belvedere' and the 'Apollo *Alexikakos*' of Calamis are the same, or at least that the former is a marble copy of the bronze original by Calamis. Sillig supposes that the statue mentioned by Pausanias must have been of bronze, because it was placed in the open air; this does not follow however, as many of the ancient Greek marbles were placed in the open air. It was dedicated in honour of Apollo after the delivery of Athens from the plague, in Ol. 87. 4 (B.C. 429), during the Peloponnesian war. It is the latest work by Calamis mentioned, and must have been made at least three or four years after the death of Phidias. His earliest work which is noticed is a pair of bronze horses mounted by boys, for the triumphal car of Onatas, placed by Deinomenes, the son of Hiero, at Olympia, in Ol. 78. 2 (B.C. 467), in commemoration of Hiero's victory at the Olympic games, twelve years after the battle of Marathon.

Lucian also, in his description of Panthea, has recourse to the aid of Calamis. He takes some of Panthea's charms from a statue of Sosandra by Calamis, which he mentions also in his 'Heteræan Colloquies' as a paragon of beauty. Many other works by Calamis are mentioned by ancient writers—as an 'Æsculapius' at Corinth, a 'Victory' at Elis, a 'Bacchus' and a 'Mercury' at Tanagra, a 'Venus' at Athens, 'Jupiter Ammon' at Thebes, 'Hermione' at Delphi, &c.

(Pliny, *Hist. Nat.*, xxxiii. 12, xxxiv. 8, xxxvi. 4; Pausanias, i. 3; Lucian, *Imag.* 6, *Dial. Meretr.* iii.; Cicero, *Brutus*, 18; Quintilian, *Inst. Orator.*, xii. 10; Strabo, vii. 491; Junius, *Catal. Artificum*; Sillig, *Catal. Artificum*; Thiersch, *Epoche der Bildenden Kunst*, &c.)

CALAMY, EDMUND, was born in London in 1600. He entered Pembroke Hall, Cambridge, at the age of fifteen, and was honourably distinguished for his scholarship; but having incurred the resentment of the Arminian party by his opposition to their opinions, he was disappointed in obtaining a fellowship. His conduct however attracted the notice of the Bishop of Ely, Dr. Felton, who made him his domestic chaplain, and gave him the living of Swaffham Prior, in Cambridgeshire. Calamy lived with the bishop till his death. Soon after this event, in 1626, he resigned his vicarage, having been appointed one of the lecturers of Bury St. Edmunds. For the ten years that he officiated in this capacity he ranked among the Conformists, though of that class which was opposed to the measures of the high church party. When at length Bishop Wren's 'Articles' were published, and the order for reading the 'Book of Sports' began to be enforced, he publicly declared his objections to them, and left the diocese. Thirty other clergymen did the same. Soon afterwards he was presented to the valuable rectory of Rochford in Essex; but this place was so unhealthy that it brought on a quartan ague, from which he never perfectly recovered, and he was compelled to quit it. In 1639, being chosen minister of the church of St. Mary, Aldermanbury, he removed to the metropolis, having separated from the Church, and openly avowed his attachment to the Presbyterian discipline. In the contentious controversies of that period on the subject of ecclesiastical affairs, Mr. Calamy bore a distinguished part. His opinions against episcopacy were stated in a work, very popular in its day, entitled 'Smectymnus,' written in answer to Bishop Hall's 'Divine Right of Episcopacy.' This composition was the work of five individuals—S. Marshal, E. Calamy, T. Young, M. Newcomen, and W. Spurston—the initial letters of whose names were put together to form this singular title. As a preacher Mr. Calamy was greatly admired, and listened to by persons of the first distinction during the twenty years that he officiated in St. Mary's. His celebrity was so well established by his writings, as well as by the distinguished station which he occupied among the ministers in the metropolis, that he was one of the divines appointed by the House of Lords in 1641 to devise a plan for reconciling the differences which then divided the church, in relation to ecclesiastical discipline. This led to the Savoy conference, at which he appeared in support of some alterations in the Liturgy, and replied to the reasons urged against them by the episcopal divines.

Like most of the Presbyterian clergy, he was averse to the execution of the king, and to the usurpation of Cromwell; during whose ascendancy he held himself aloof from public affairs, resisted his proposition for a single government, and did not scruple to declare his attachment to the dethroned prince. Accordingly he was among the foremost to encourage and promote the efforts that were made for the restoration of Charles. He strongly recommended it in a sermon preached before the House of Commons, on the day prior to that on

which the House resolved to invite the king back to his kingdom; and he was one of those deputed to meet Charles in Holland with the congratulations of the nation. On his majesty's return, he appointed Mr. Calamy one of his chaplains; the duty of which office, owing to pressing engagements, he performed, it is generally said, no more than once, but Poyte in his 'Diary,' June 6, 1660, notes that "his letters tell him that Mr. Calamy had preached before the king in a surplice: "he indeed adds a note, "that I heard afterwards to be false," but he appears to mean the use of the surplice. It is certain that Calamy preached once solemnly. Poyte notes under August 12, 1660, "(Lord's Day.) To White Hall Chapel, where Mr. Calamy preached, and made a good sermon, upon these words, 'To whom much is given, of him much is required.' He was very officious with his three sermons to the king, as others do." It is evident that the king's Presbyterian chaplain was closely watched; but it appears also evident, judging from his text, that if he was ready to pay all the usual marks of reverence to his majesty, he was not disposed to shrink from reminding him of the duties as well as the privileges which his exalted position devolved upon him. Besides his chaplaincy Calamy was offered the bishopric of Lichfield and Coventry, which it is thought he would have accepted, if he could have subscribed to the terms of the king's declaration. His moderation was such, that he appeared only desirous of removing those restrictions which affected the Presbyterian clergy, accompanied with such reforms in the services of the church as would have allowed a conscientious performance of their pastoral duties. But finding the temper of the high Church party set up a blind rejection by acts of further restraint and intolerance, he seized upon the opportunity of the passing of the Act of Uniformity to resign his living. Being well received at court, his friends recommended him to petition for an indulgence; but his request was fruitless. He did not, like some of the other ejected ministers, attempt to assemble a congregation elsewhere, but still continued to attend the church in which he had so long officiated. On one of these occasions, when no clergyman attended, some of his friends requested him to preach. After some hesitation he ascended the desk, from which it had always been his custom to deliver his discourses, and preached upon the concern of old Eli for the ark of God, into which he introduced some matter that touched upon recent events; which being deemed seditious, he was committed to Newgate, where he lay, until the outcry raised by his friends induced the king to order his liberation. He lived to see London in ashes; which event had such an effect upon his nerves, that he survived the melancholy spectacle little more than a month. He died October 29, 1666. Mr. Calamy was considered an able theologian. His publications consist of single sermons preached upon particular occasions, and a vindication of himself against an attack made upon him by Mr. Burton, entitled 'The Godly Man's Ark, or a City of Refuge in the Day of his Distress.'

Two of Mr. Calamy's sons, who were educated at Cambridge for the church, took opposite sides on the disputed points of ecclesiastical affairs; the eldest, Edmund, having, after his ejection from his living, become a decided nonconformist; while his other son, Dr. Benjamin Calamy, not only adhered to the high church party, but wrote in its defence 'A Discourse against a Scrupulous Conscience;' the tenour of which is, to stigmatise as crime the act of separating from the church.

A grandson of Mr. Calamy was a celebrated nonconformist divine, and is the well-known biographer of the ejected ministers; and also of Baxter's 'Life and Times.' This gentleman, also called Edmund, after his father and grandfather, on a visit to Scotland in 1709, received the degree of Doctor in Divinity from each of the universities of Aberdeen, Edinburgh, and Glasgow. (Calamy, *Nonconformist's Memorial*.)

CALANUS, an Indian philosopher of the sect called by the Greeks *Gymnosophists*, or 'naked philosophers.' Alexander the Great, in the course of his Indian expedition, met with a body of these singular men, and being desirous of speaking with them, he deputed Onesicritus to invite them to visit him. Dandamis, their chief, refused to go himself or to allow any of his followers to go, saying that he was as much the son of Jupiter as Alexander, and that he wanted nothing from Alexander, but was quite satisfied with what he had. Calanus (Plutarch says his real name was Spitaneus, and that Calanus was a name given to him by the Greeks from his custom of using the word *kalos* instead of *gymn* in saluting) was the only one who could be prevailed upon; and, amidst the reproaches of his colleagues, he consented to accompany Alexander in his expedition. On arriving at Pansargata in Persia he fell ill. He had never been ill before, and would not now submit to be nursed or doctor'd, but insisted on being burnt. After many fruitless endeavours to dissuade him from his resolution, Alexander ordered a colossal pile to be raised, and a golden couch to be placed on it by Ptolemaeus, son of Lagus. Calanus was driven in a carriage to the spot, crowned after the Indian fashion, and chaunting hymns to the gods in the Indian tongue, he mounted the pile, and laid himself down in the sight of the whole army, and continued motionless amidst the flames. As soon as the fire had been kindled, trumpets were sounded, and it is said that even the elephants joined the army in raising a war-shout in honour of Calanus. The various ornaments with which Alexander had ordered the pile to be decorated were dis-

tributed to those who were present. While Calanus was riding to the pile, Alexander asked him if he had any requests to make. He replied, "No; I shall see you soon in Babylon." Alexander died soon after in Babylon, B.C. 323. Calanus was in his seventy-third year when he died. (Strabo, xv. 1; Arrian, vii.; Cicero, 'De Div.,' l. 23; Valer. Max. l. 8.)

CALDARA. [CARAVAGGIO.]

CALDAS, FRANCISCO JOSÉ DE, born at Popayan in New Granada, about 1773, deserves notice as an example not common anywhere, but very unusual in South America, of a man who unaided by books or teachers arrived at a very respectable position as a man of science. His studies and researches included botany, physical geography, mechanics, and astronomy. Before Humboldt had opened the region of the Andes to the scientific world, Caldas had constructed with his own hands a barometer and other instruments, and explored a considerable tract, and taken the altitude of several of the loftiest summits of that vast range. When Mutis made his celebrated exploration of New Granada, Caldas rendered him important assistance; the admeasurements of Chimborazo and some other peaks were made by him. About 1805 or 1806 he received the appointment of director of the observatory of Santa Fé de Bogota. His chief scientific labours are embodied in the 'Semenario de la Nueva Granada,' of which he published the first number in 1807, and which ultimately formed two 4to volumes. Caldas having eagerly embraced the cause of independence, unfortunately fell into the hands of Morillo, who caused him to be executed October 30, 1816. The scientific labours of Caldas have been highly praised by several European savants, especially by Humboldt. A new edition of the 'Semenario,' augmented by the addition of several of Caldas's inedited writings, was published at Paris under the care of M. A. Lasserre in 1849. (Acosta, *Breve Noticia sobre F. de Caldas*; *Nouvelle Biog. Univ.*)

CALDERARI, OTTONE, was born of a noble family at Vicenza in 1730. Although that city is indebted to him for many important additions to its previous architectural attractions, little has been told respecting his life. His enthusiasm for architecture is said to have been first excited by viewing the Basilica of Vicenza by moonlight, which made so powerful an impression upon him that he thenceforth devoted himself to the study. One of his earliest recorded works was the casino erected by him near Vicenza, in 1772, for the Count Anti-Sola, which has a very extended front towards the gardens, with terraces uniting the house to the wings. In 1773 he built the small Palazzo Bonini at Vicenza, with a façade of two orders, Doric and Ionic (of five intercolumnus), surmounted by an attic; it is a most decided imitation of Palladio. The Palazzo Cordellina (1776) at Vicenza, which is esteemed by his editors his "capo d'opera," differs very little from the preceding in the style of its façade, which presents the same orders. The Villa Porto at Vivaro, five miles from Vicenza, erected in 1778, is a happier specimen of his talent, and the Doric colonnades between the body and wings, backed by a screen wall with openings in it, produce much scenic effect. In 1782 he built the Palazzo Loschi at Vicenza, a Corinthian order and attic on a rusticated basement; in 1785 the Casino Todaro, and also the Palazzo Quinto and Salvi, in the same city. Nor was Vicenza alone the scene of his architectural labours, for he designed the beautiful atrium of the Seminario at Verona, the Villa Capra, at Marano, and the Casa Cocastelli in the Mantuan territory.

Count Calderari belonged to the principal academies and societies in Europe, and was elected by the French Institute expressly as being "foremost among the Italian architects of that day;" nor can it be denied that he is entitled to the admiration of those who hold Palladio to be a pattern of excellence. He died at Vicenza, October 26, 1803, and his eulogy was pronounced by Diedo, secretary to the Academy of Fine Arts, Venice, and the chief editor of his 'Opere di Architettura,' &c., 2 vols. folio, 1808-17.

CALDERON DE LA BARCA, DON PEDRO, a great Spanish dramatist, born of noble parents at Madrid, in 1601, suggests a striking parallel with Lope de Vega, his celebrated countryman and forerunner in the same career. Both were wonderfully precocious: Lope wrote plays at the age of eleven or twelve, and Calderon exhibited no inferior genius at thirteen in his 'Carro del Cielo' (the Heavenly Chariot). Both devoted the vigour of life to the military profession, and their maturity to the ecclesiastical order; and the poetic talent of both continued to advanced age. Both of them acquired reputation and even affluence from a gift proverbially doomed to penury, and at the most hardly promising more than posthumous renown.

Lope and Calderon gave the law to the Spanish theatre. With all their irregularity, they both exhibit a singular mixture of sublimity and absurdity, with frequent flashes of genius, and passages of striking truth to nature; thus frequently redeeming their numerous faults, and making amends for many to us now very ridiculous scenes. The fertility of these two writers is not the least surprising part of their history. Lope added 2000, and Calderon 500 pieces at least to the national dramatic stock. Their success could not fail to call forth numerous imitators at home and abroad: Corneille, there is little doubt, formed his *Horatius* upon the play of Calderon, as he certainly took his *Cid* and his *Menteur* from Guillermo de Castro. Molière's 'Femmes savantes' was suggested by Calderon's 'No hai burlas con el Amor' (Love is no Joke); and Scarron grossly disfigured, under the

title of 'La fausse Apparence,' Calderon's 'Nunca lo peor es cierto' (The worst is never true). The French translations by Linguet doubtless contributed largely to produce this effect. On Linguet's 'Viol puni,' a translation of Calderon's 'Alcalde de Zalamea,' the well-known Collet d'Herbois built his 'Paysan magistrat.' Not to mention numerous other instances of a similar kind, it should not be forgotten that Calderon's 'Secreto a voces' (The published Secret) has appeared in the Italian, French, and German languages.

Calderon's talents, which had been early manifested at school under the Jesuits, developed at Salamanca, and already admired in the Spanish possessions of Italy and the Low Countries, were at last encouraged by the patronage of Philip IV., who bestowed on him a knighthood of Santiago in 1636; invited him to Madrid in 1640 to write the 'Certamen de Amor y Zelos' (the Contest between Love and Jealousy), a sort of festival to be performed on the lake of Buen-Retiro; and soon raised his allowance to an escudo more per day. Subsequently, in 1649, he intrusted to his taste and ingenuity the plan and directions of some triumphal arches, under which the royal bride Mary Anna of Austria was to pass.

At the age of fifty Calderon entered the church, and two years afterwards, the king bestowed on him a chaplaincy of Toledo. In 1663 he gave him another similar piece of preferment, with a handsome pension charged on the revenue of Sicily, and other similar acknowledgments of his services and merits. During the long period of thirty-seven years he wrote, by special commission of the municipality of Madrid, and of other cities, such as Toledo, Sevilla, and Granada, about 100 'Autos Sacramentales,' or sacred pieces, which resemble those of the 16th century, commonly called 'Mysteries.' The 'Autos' of Calderon soon superseded those of all previous Spanish authors; and to their composition the poet devoted the remaining thirty years of his life after he had entered the ecclesiastical profession. In his eightieth year he wrote his 'Hado y Divisa.' As the booksellers were now selling spurious works under his name, he was urged by the Duke of Veraguas to make a true list of all his works, but he merely sent a list of his 'Autos,' expressing, on religious grounds, very little concern for the rest.

Some of the 'Autos' of Calderon, especially that entitled 'La Devocion de la Cruz' (the Devotion of the Cross, meaning its miracles), are the best productions of the kind. Augustus Schlegel has translated this work, with some of the best of his dramas, such as 'El Principe constante,' a tragedy which might be called the Lusitanian Regulus for its Portuguese lofty subject. It is indeed Calderon's masterpiece, and displays the full lustre of his genius. He wrote likewise a poem in octaves on the 'Novisimos,' or 'Postrimerias' (the old scholastic and ascetic collective denomination of death, judgment, heaven, and hell). There is also among his works a discourse on painting, 'La Nobleza de la Pintura'; another in vindication of the stage, 'Defensa de la Comedia'; and many songs, sonnets, and ballads, with numerous short poems to which the highest prizes were adjudged on various occasions.

The date of Calderon's death is variously stated, but that of 1681, on the 26th of May, Whitsuntide day, which is given by an old biographer, his great friend and panegyrist, appears to be the most correct.

To revert to the parallel between the two great Spanish dramatists. Lope was bolder and ruder, Calderon more brilliant and refined, a keener observer of the female mind and manners, a readier contriver of plots, which are full of business and bustle, naturally arising from intricacies which are most happily disentangled in his denouements. In this respect he surpasses even Moreto and Solis, but he does not always keep within the rules of strict morality. He allows vice too frequently to triumph, out of deference, probably, as some would have it by way of apology for him, to the fashionable morals of the time. The chivalrous delicacy as to the point of honour, which often supplies the place of morality, is displayed in its most favourable aspect in some of his dramas. Sometimes he appears to be seized with a moralising fit, which contrasts strangely with the levity, merriment, intrigues, and mad gallantry which were exhibited for the first time on the Spanish stage in his 'Comedias de Capa y Espada' (Plays of Cloak and Sword). These pieces take their name from the dress in which they were performed (then the general costume of the gentry throughout Europe), and in contradistinction to the 'Comedias heroicas' (Historical Dramas), which were intended to excite surprise and admiration. In the latter, love is the feeling which actuated the champions of chivalry, while in the former it is merely a verbose and glozing gallantry which succeeded to the poetical worship of the fair. These being a sort of dramatised novels, on subjects selected from fashionable life, gave full scope to Calderon's elegance of language, gracefulness of dialogue, facility of versification, richness of diction, and fertility of imagination; qualities indeed which sometimes make him too diffuse.

Calderon gave the last polish to the Spanish theatre without changing its nature. He imparted dignity to the historical, or, as they were styled 'heroic' comedies; but while some of them are the best, others are the most trivial of his productions, and are full of historical blunders.

The greater part of Calderon's works were published at Madrid in 9 vols. 4to, 1689: the first three volumes contain his comedies, and

the six last a great number of his 'Autos Sacramentales.' They were reprinted at Madrid in 1726 and 1760 in 10 vols. 4to. A collection of his 'Autos' appeared also at Madrid in 1759 in 6 vols. 4to. In 1830 George Keil published at Leipzig a splendid edition of Calderon in 5 vols. 8vo; other editions of his plays have since been published. The 'Teatro Español,' published by La Huerta, gives but a partial idea of Calderon's talent; for he has selected the 'Comedias de Capa y Espada,' two only excepted, one of which is styled 'heroica,' although it belongs to the mythological class.

CALDERWOOD, DAVID, was a native of Scotland, and was brought up to the church. He was born in 1575. In 1604 he became the minister of the parish of Crelling in the south of Scotland, where he was greatly respected.

When James I. of England visited Scotland in 1617 for the purpose of introducing, by the aid of a Scottish parliament and the general assembly, certain legal enactments, the object of which was to bring the Scottish church into conformity with the church of England, Calderwood was one of those who were most strenuous in their opposition. He and other ministers of the church having signed a protest against the proposed measures, they were summoned before a court of high commission in which the king himself presided. Persecution and threats having both failed to make Calderwood change his opinions, he was thrown into prison, and was afterwards banished from the kingdom. He went to Holland, where in 1621-23, he published in 4to a work in Latin, entitled 'Altare Damascenum, &c., in which he enters into a full examination of the principles of the Church of England, its government, ceremonies, and connection with the state. The work made a great impression at the time, and was translated into English under the title of 'The Altar of Damascus, or the Pattern of the English Hierarchy and Church, obtruded upon the Church of Scotland,' 12mo, 1621. A report having been spread that Calderwood was dead, a man named Patrick Scot published a pretended recantation, with the title 'Calderwood's Recantation, directed to such in Scotland as refuse Conformity to the Ordinances of the Church,' London, 1622. It was soon discovered to be a base forgery, and the king himself was accused of having lent his assistance in writing it. Calderwood in the meantime had returned secretly to Scotland, where he lived some years in concealment. He collected the materials for a 'History of the Church of Scotland,' which are preserved in manuscript in the Advocates Library, Edinburgh, in 6 vols. folio, with a preface detailing the principal circumstances of his life. From the materials of this work Calderwood wrote his 'History of the Church of Scotland from the Beginning of the Reformation unto the End of the Reign of James VI., beginning 1560 and ending 1625,' folio. He is supposed to have died in 1651.

CALEPI'NO, AMBRO'GIO, was born at Calepio in the province of Bergamo in 1435. He became an Augustine friar, but devoted himself chiefly to philology. His great work was a Latin dictionary, which was one of the earliest works of the kind, and was first published at Reggio, fol. 1502. It went through many editions, most of them with numerous additions, which made it almost a new work. Passerat's edition, 1609, with the title 'Dictionarium Octolingue,' contains the corresponding words in Greek, Hebrew, Italian, German, Spanish, French, and English. Other editions added the Slavonian and Hungarian. Faccioliati, assisted by Forcellini, published a new edition of Calepio's, or rather Passerat's dictionary, also in eight languages, 2 vols. fol., Padua, 1731. While engaged on this labour Forcellini conceived the idea of a totally new and more complete and critical lexicon, and after spending thirty years in compiling it, he published it under the title of 'Totius Latinitatis Lexicon,' 4 vols. fol., Padua, 1771. Forcellini's lexicon superseded all former Latin dictionaries. Calepio died in November 1511.

CALHOUN, JOHN CALDWELL, one of the most influential of the recent statesmen of America, was born on the 18th of March 1782, at Abbeville in South Carolina. His father, Patrick Calhoun, was by birth an Irishman, but he emigrated to America early in life, settled in Carolina, and took an active part on the American side during the war of independence. John C. Calhoun graduated with distinction at Yale College in 1804; and, having completed his legal studies in Connecticut, returned to his native place in 1807 to enter upon the practice of his profession. He was elected the following year a member of the South Carolina House of Representatives, where his clear vigorous intellect soon obtained for him considerable notice. In 1811 he was sent as a representative to the United States Congress, and the rest of his life was spent at Washington. During the discussion of the important measures which in the course of the next five years excited the public mind, Mr. Calhoun played a prominent part, and his fervid eloquence, eagerly defending and stimulating the popular war-ory, won for him a commanding position. On Mr. Monroe's election to the presidency of the United States in 1817, he appointed Mr. Calhoun his secretary of war, a post he retained during the eight years of Mr. Monroe's tenure of office. His administration was marked by energy and judgment, and secured his position as one of the ablest public men of his time. On the next election, 1825, he was named as a candidate for the presidency, but withdrew his claim, and eventually he was chosen vice-president. To this high office he was re-elected in 1829, when General Jackson succeeded Mr. Adams as

president; but he differed greatly from Jackson in policy, especially on the tariff and Bank Charter questions; and in 1831 he resigned the vice-presidency, and was elected by South Carolina to the Senate of the United States. From the end of his term of six years he remained in retirement, until President Tyler in 1843 appointed him secretary of state, an office he held till the election of President Polk in 1845. In that year he again became the representative of South Carolina in the senate. He had now come to be regarded as the great leader and representative of the southern states in Congress, and no man was listened to with greater attention by all parties. An intense and fervid republican, he was yet eminently conservative in spirit, a staunch defender of all southern rights, and the inflexible supporter of the institution of slavery. In general and international politics, he commonly took the popular, or, as it is usually termed, the patriotic side. He died March 31, 1850. Many of Mr. Calhoun's speeches were printed as separate publications about the time of their delivery; and his collected 'Works' are now in course of publication at Charleston and Columbia.

CALIARI, PAOLO. [CAGLIARI, PAOLO.]

CALIDASA is the name of one of the most admired Indian poets. Hardly anything is known concerning the circumstances of his life. A tradition, very generally believed in India, makes him one of the nine poets or distinguished poets who lived at the court of King Viraśādhitya. If by this name the same sovereign is to be understood from whose reign (no. 36) the years of the Samvat era are counted, Calidasa must have flourished about the middle of the century preceding the commencement of our era. Another king of the name Viraśādhitya ascended the throne in A.D. 191, and a third in A.D. 411; and several considerations, especially the highly-polished style in which the works attributed to Calidasa are written, favour the assumption that the poet lived under Viraśādhitya II. At all events our author must be distinguished from a poet of the same name who lived in the 12th century at the court of Rājā Bhōja, the sovereign of Dindār. The *Nalodaya*, a Sanscrit poem on the subject of the story of Nala and Damayanti, from the *Mahābhārata*, written in an exceedingly forced and artificial style, full of rhymes and plays upon the sound of words, to which the name of Calidasa is affixed, should probably be attributed to the Calidasa of Rājā Bhōja's court.

But however imperfect our information about Calidasa may be, we possess in his works abundant evidence of the power of his genius. We do not hesitate to pronounce him the most universal, the least constrained by national peculiarities, not merely of all Indian, but of all Asiatic poets with whose works we are acquainted; and to this character of his mind, which while seeming to breathe the purely human air of Greece, yet retains all the quickness and glow of feeling, all the vividness of description and imagery of the Hindoo, must, in our opinion, be mainly attributed the undivided admiration with which the translation of his drama, '*Sacuntalā*,' by Sir William Jones (the first work that made known the name of Calidasa to Europeans), has been everywhere received. This translation appeared for the first time at Calcutta in 1789, but was soon reprinted in England, and was from the English, at an early period, retranslated into several other languages of Europe. We may particularly notice the German translation by George Forster, who appended to it a glossary explanatory of the allusions to Indian mythology, natural history, &c. The popularity which the play has acquired on the continent is attested by the fact that several attempts have been made to adapt it to the stage. In 1830 the Sanscrit text of '*Sacuntalā*' was published at Paris from a manuscript belonging to the '*Bibliothèque de Roi*' by the late Professor A. L. Chézy, with an original French translation; and upon this edition is founded a new translation into German by M. Hirzel, Zurich, 1833, 8vo, in which the various metres of the text are imitated. Both Sir William Jones's translation and Chézy's edition however exhibit the work of Calidasa according to the interpolated shape in which it is now current in Bengal. This discovery was made by Mr. Hermann Brockhaus, of Leipzig, who, in 1825, examined and collated the numerous manuscripts of the drama in the library of the East India Company, and in the private collection of Professor H. H. Wilson at Oxford. The most recent editions are one of the text published at Calcutta in 1849; one of the text with a German translation by Buchenbach, Bonn, 1846; another German translation by E. Meier, Stuttgart, 1852; and a free English translation, in prose and verse, by Professor Müller Williams, remarkable for the accuracy of the version and for the beauty of its typography: Hertford, 1855.

We must confine ourselves to a mere enumeration of the other principal works of Calidasa. Besides '*Sacuntalā*,' we possess two other dramatic poems attributed to him—'*Viraśādhitya*,' founded upon an ancient Indian legend of the loves of King Juraśāva and Urvāl, a colonial triumph translated by H. H. Wilson in his '*Hindu Theatre*,' the text printed at Calcutta in 1830, and critically re-edited with a Latin translation by Lenz, Berlin, 1833, 4to; and again with a German translation by Lenz, St. Petersburg, 1849; and '*Dhūrtasāmagama*,' a *śānti* poem, as yet unedited. The '*Māgha Dūta*,' or '*Cloud-Messenger*,' a lyrical poem of only 116 stanzas, contains the complaints of a dejected banished to earth, who entreates a passing cloud to convey an affectionate message to his wife. It was edited with a translation into English verse and with notes by H. H. Wilson, Calcutta, 1813, 8vo; by Goldemister, Bonn, 1841; and German translations have been

published by Herzl, Zurich, 1846; and by Max Müller, the present professor of modern languages at Oxford, Königsberg, 1847. The '*Rāghu Vansa*' is a narrative poem in celebration of the family of Rāghu, in which Rāma, the hero of the *Rāmāyana*, and as the incarnation of Viāṇu an object of great veneration with the Hindoos, was born: it has been edited with a Latin translation by Stenzler, London, 1832, 4to, and with a Sanscrit prose paraphrase by the pundits of Fort William at Calcutta, 1832, 8vo. The '*Cumāra Sambhava*' is another epic poem designed to celebrate the birth of Cumāra, the son of Pārvaṭī; but it clozes with Pārvaṭī's wedding. An edition and translation of this work by Stenzler was published under the auspices of the London Oriental Translation Fund at Berlin in 1838. Part of the first canto is given in Sanscrit and English, and with interesting annotations, by (we believe) the Rev. Dr. Mill of Calcutta, in the *Journal of the Asiatic Society of Bengal* for July, 1833, pp. 329-358. A short didactic poem on prosody, exhibiting the most common sorts of metre, and called '*Śrutabodha*,' is likewise attributed to Calidasa as well as two or three other short pieces.

CALIGULA, CAIUS CÆSAR, the fourth of the Roman emperors, son of Germanicus and Agrippina, was born A.D. 12 in a Roman camp, in what place is not agreed, though Suetonius would seem to show that he was born at Antium. He was brought up among the soldiers, and is best known by a nickname said to have been given him by those associates. The word '*caligula*' is derived from '*caliga*,' a kind of shoe which was worn by the common soldiers, and which he frequently wore himself in order to gain their affections. (Tacit. '*Ann.*' i. 41, 69.) The training and education which would have been suited to his rank appear to have been neglected. Caligula early devoted himself to observing the feelings and courting the favour of Tiberius, and by artful and unremitting attentions he so far succeeded in ingratiating himself with the emperor that he was soon promoted to responsible offices of state. The uncertainty of succession which followed the death of Tiberius, who was put to death probably by one of Caligula's favourites (Tacit. '*Ann.*' vi. 50), together with the general popularity which Caligula himself enjoyed, afforded him a favourable opportunity of succeeding to the sovereign power (A.D. 37). His government began well, and with symptoms of great clemency; he set at liberty all the state-prisoners, discouraged informers, and promised the senate that he would not with the utmost moderation: he augmented the powers of the magistrates, and at least apparently curtailed his own. Soon afterwards he assumed the consulship, and chose for his colleague his uncle Claudius. During his consulship Caligula gave many instances of mildness and generosity; among other things he restored the kingdom of Commagene, which Tiberius had reduced to a Roman province, to Antiochus, son of the former king. After about eight months he fell ill, and the utmost anxiety was shown in inquiring for his health. His recovery was hailed with joy. His conduct however was soon changed. Caligula became addicted to intemperance, voluptuousness, and cruelty, and his extravagance knew no bounds. He took upon himself the highest titles of honour, and even had temples erected and sacrifices offered to him as a god. It seems probable that his grandmother Antonia died by his orders. According to Dion Cassius, he frequently visited the prisons in person, and ordered all the captives, untried, guilty, or not, to be thrown to wild beasts. Sometimes he would order a number of the spectators to be seized and thrown among them, after having had their tongues cut out, that their cries might not interrupt his ferocious delight. Old age and weakness rather attracted than averted his cruelty. He even put to death Macro, who had been the means of his elevation, and his wife with him. His lust was as excessive as his cruelty. A favourite horse, Incitatus, he fed with gilt oats and delicious wines; he appointed him a great number of attendants, and treated him with the most absurd attentions. He erected a bridge over the sea from Baie to Puteoli, on which he rode along, enjoying the sight of numbers of persons drowning under his order. He made great preparations for a war against the Germans, and crossed the Rhine with a large army, but returned without having seen a single enemy. He invaded and plundered Gaul, banished his sisters Agrippina and Livia, pretended that he was going to invade Britain, but returned after he had got a few miles out to sea, and then on his arriving in Rome contented himself with an ovation. It is said that Caligula had a design to destroy the works of Homer, Virgil, and Livy.

British Museum. Actual size. Bronze. Weight 450 grains.

After a reign of three years, ten months, and eight days, and in the twenty-ninth year of his age, Caligula was murdered by a band of conspirators, headed by Cassius Chærea, a tribune, A.D. 41. (Sueton. *in vit.*, c. 69.) The character of this emperor is pretty accurately given by Seneca ('De Ira'), when he says that nature seems to have intended to show in the instance of Caligula how much harm can be done by the greatest vices leagued with the greatest power. Perhaps the true explanation of his proceedings is that he was insane. Caligula had several wives, but he left no children behind him. The medal which is here given contains on the reverse the names of his three sisters—Agrippina (afterwards the wife of her uncle the Emperor Claudius), Drusilla, and Julia, who is called Livia or Livilla by Suetonius. (Dion Cassius, pp. 694, 717-763, H. Stephens, 1592.)

CALIPPUS, author of the **CALIPPIC PERIOD**. Calippus, of Cyzicus, lived about B.C. 330. He is said to have been a disciple of Plato. He observed at the Hellespont, and is said to have detected the error of the Metonic cycle by means of a lunar eclipse which happened six years before the death of Alexander. Very little more is known of him, and that little not worth stating.

The meaning of the 'Calippic period' may be briefly stated as follows. Suppose a perfectly central eclipse of the moon to a spectator at the earth's centre, that is, suppose the centres of the sun and moon, and the junction of the moon's orbit with the ecliptic, or the node, to be all at the same point of the visible heavens. The revolutions of these three points, the sun's centre, the moon's centre, and the moon's node, would then begin, and a whole cycle of eclipses would take place, in a manner depending upon the relative motions of the three, until such time as the same phenomenon, namely, the central lunar eclipse, again happened at the same node. After this, the cycle of eclipses would recommence in the same order, because all the circumstances of motion on which eclipses depend are recommencing. Thus if the second-hand of a watch were mounted on the same pivot as the minute and hour hand, they would all be together at 12 o'clock, and all the possible *phases* (appearances) which their relative positions could present would be completed in twelve hours, and then begin again. Next it is evident that though such a coincidence of sun, moon, and moon's node never take place, the period elapsed between two epochs at which the three are very near to each other will present a succession of eclipses which will nearly be repeated, that is, with nearly the same circumstances, in the next such period.

The cycle of Meton was composed of 235 lunations, or periods from new moon to new moon, containing a very little more than 255 revolutions from a node to the same node again, about 254 complete sidereal revolutions of the moon, and 6940 days, or a few hours more than 19 years. This may be called a first approximation, and it is still sufficiently exact for finding Easter.

Calippus observed that a more correct period might be formed by taking four times the period of Meton, all but one day, or 27,759 days, or very nearly 76 years. This period contains 940 complete lunations, 1020 nodal revolutions, and 1016 complete sidereal revolutions; all very nearly. The Calippic cycle is therefore four Metonic cycles, all but one day. The analogy with the common and leap year will fix this in the memory. Calippus began to reckon his cycles from the new moon next following the summer solstice of the year B.C. 380, being the commencement of the third year of the 112th Olympiad, A.U.C. 423, Julian period 4884, era of Nabonassar 418.

CALIXTUS, or **KALLISTUS I.**, one of the early bishops of Rome, succeeded Zephyrinus A.D. 219, and died in 223. Little is known about him; some say he suffered martyrdom, but this is doubted by others. One of the Roman catacombs, or subterraneous cemeteries, was named after him.

CALIXTUS II., son of William, Count of Burgundy, succeeded in the see of Rome Gelasius II. in 1119, and died in 1124.

CALIXTUS III., **ALONZO BORJA**, a Spaniard and bishop of Valencia, was made pope after the death of Nicholas V. in 1455. He endeavoured to form a general league of the Christian princes against the Turks, in order to save Constantinople. He died in 1458, and was succeeded by Pius II. Calixtus was maternal uncle to Roderic Lenzoli Borja, whom he made cardinal, and who became afterwards Pope Alexander VI.

There was another Calixtus, an antipope, who assumed the title of Calixtus III. in the schism against Pope Alexander III. in the 12th century, but afterwards submitted and resigned his claim.

CALKOEN VAN BEEK, **JAN FREDERIK**, was born May 5th, 1772, at Groningen, in Holland. He studied at Amsterdam, and afterwards at Utrecht, where he remained seven years, at first applying himself to theology, but subsequently to mathematics and astronomy. He afterwards spent some time at the universities of Göttingen, Leipzig, and Jena, and also visited the observatories of Gotha and Berlin. In 1799 he was appointed professor extraordinary of astronomy and mathematics in the university of Leyden, and in 1804 he became the ordinary professor. In the following year he accepted the same professorship in the university of Utrecht. As one of the commission for examining into the weights and measures of Holland, his services were considered of such importance as to receive the public thanks of Louis Bonaparte, the king; and when the National Institute of Holland was established, he became one of the first members. He died March 25, 1811. He published a treatise in Latin on the machines

and other contrivances of the ancients for the measurement of time, and an 'Onderzoek naar den Oorsprong van den Mozaïschen en Christelijken Godsdienst' ('Inquiry into the Origin of the Mosaic and Christian Religion'), which work was written as a refutation of the treatise of Dupuis entitled 'Origine de tous les Cultes.'

CALLCOTT, **SIR AUGUSTUS WALL**, R.A., was born at Kensington in 1779, and died in the same place in the close of the year 1844, aged sixty-five. He was the brother of the distinguished composer, Dr. Callcott, and he himself in early life officiated for several years in the choir of Westminster Abbey under Dr. Cooke. He however preferred painting to music, and for some time pursued both studies together, until the success of a portrait which he painted under the tuition of Hoppner, in 1799, and which he exhibited, led him to the final choice of painting as his profession. Very little experience however showed him that portrait was not suited to his taste, and in 1803 he devoted himself exclusively to the practice of landscape-painting.

Callcott was elected an associate of the Royal Academy in 1807, and a member in 1810. For his diploma-picture, he presented a beautiful painting called 'Morning.' In 1837 he was knighted by the Queen; and at the death of Mr. Seguer in 1844, he was appointed his successor as Conservator of the Royal pictures; he however held this office for a very short time. He died November 25, 1844, and was buried on the 30th of November in Kensal Green Cemetery, where his wife, Lady Callcott, had been buried two years previously.

For many years Callcott was a steady and large contributor to the exhibitions of the Royal Academy. His landscapes were generally of small dimensions, and all very similar in style; but most of them are extensive as views, extremely quiet in character, and strictly belong to the beautiful as a class. He was less extensive in his distances than Claude, but more defined; in his fore-grounds he was more correct and natural than Claude, except in the foliage, especially of large trees; in colour he was perfectly true and natural. By his admirers he was sometimes designated the English Claude. Like those of his prototype, his works are perhaps more frequently original characteristic pictures of certain scenery, as 'Italy,' 'Morning,' 'Evening,' &c., than mere views of particular localities. Many of his pictures have their titles from the occupation of a few figures introduced into them, as 'Returning from Market,' 'Waiting for the Passage-Boat,' 'The Ferry,' &c. He painted also some marine pieces. In 1833 he had in the exhibition a beautiful picture called 'Harvest in the Highlands,' in which the figures were painted by E. Landseer, R.A.: this picture has been admirably engraved by Wilmore for presentation to the subscribers to the Art-Union for 1836. In 1837 Callcott departed from his usual style and exhibited a picture of 'Raffaello and the Fornarina,' which attracted considerable notice, and was selected by the directors of the London Art-Union to be engraved by L. Stocks for circulation among the subscribers for the year 1843. The success of this piece seems to have induced the painter to attempt a work on a much larger scale in the same style. He exhibited in 1840 a picture of 'Milton dictating to his Daughters,' in which the figures were about the size of life; the attempt was however a failure; the composition was extremely meagre and commonplace, and the figures, especially one of the daughters, were ill-drawn. However, as a landscape-painter, Callcott has earned a reputation which will ensure his name an honourable place among the best recent painters in that department of the art.

LADY CALLCOTT was the widow of Captain Graham, R.N., and was married to Sir Augustus in 1827. She was born in 1788: her maiden name was Mary Dundas. She was the daughter of Captain Dundas, and was married early in life to Captain Graham, with whom she went to India in 1809. She remained in India two years, and visited during that period many of the most remarkable places in that country, and published an account of her travels after her return home. She published at a later period two works relating to Italy, where she dwelt for some time,—'Three Months in the Environs of Rome,' and 'Memoirs of Poussin.' In 1821 she embarked with her husband for South America, but Captain Graham died during the voyage, and was buried at Valparaiso.

After her second marriage she paid another visit to Italy, in the company of Sir Augustus, and turned her attention particularly to art. In 1836 she published her last literary work, under the title—'Essays towards the History of Painting,' which, notwithstanding an unfortunate corruption of names, partly due to the old translation of Pliny by Philemon Holland, and a few other inaccuracies, is a very creditable popular performance.

(*Art-Union Journal*, 1843-45; *Catalogues of the Exhibitions of the Royal Academy*; *Waagen, Kunstwerke und Künstler in England*.)

CALLCOTT, **JOHN WALL**, one of the brightest ornaments of the British school of music, was born in 1766, at Kensington, where his father carried on the business of a builder. At the age of seven he was entered as day-boarder in a neighbouring school, where he made such progress that he commenced reading the Greek Testament in his twelfth year, when family affairs occasioned his removal, from which period, great and various as were his acquirements, he was self-educated, a circumstance to which, probably, the vigour of his unshackled mind may be attributed. Music, at first his amusement, accidentally became his profession, instead of surgery, for which he

was preparing to qualify himself, when the sight of a severe operation on a patient, and of an excess of remarkable sensibility, that he at once abandoned all hope of succeeding in the healing art, and devoted himself to that of harmony, the study of which he prosecuted without any master; though by a constant attendance at the Chapel Royal, at Westminster Abbey, and many concerts, together with the friendly hints, given, in frequent conversations, by Doctors Cooke and Arnold, he, no doubt, profited very largely.

He commenced his professional career in the subordinate capacity of singing-master of St George the Martyr, Queen Square; and at about the same time made his first attempt in the composition of that truly national music, the Glee. In 1785, when only nineteen years of age, he appeared as a candidate for the prizes annually given by the Glee Club, and obtained three out of the four gold medals. Among the numerous pieces was that masterly composition, 'Oh! comfort of the willing soul.' Thus encouraged, he followed up with assiduity and industry the course so auspiciously begun, and in the following ten years, twenty medals of the same distinguished society were awarded to him.

In 1785 Mr. Callcott was admitted bachelor-in-music by the University of Oxford. In 1787 he assisted in forming the Glee-Club. In 1790 he took advantage of the arrival of Haydn in this country, and derived considerable knowledge in the higher branch of instrumental composition from that illustrious musician. He advanced to the degree of doctor-in-music at Oxford, in 1790; his exercise was a Latin motet, selected from Isaiah, beginning 'Propter Sion non tacuisti.' His 'Musical Grammar' appeared in 1805. About the year 1800, he undertook to deliver lectures on music at the Royal Institution, a task "most of all others suited to his studies and gratifying to his ambition; but the very anxiety he felt to execute the duty in a manner worthy of himself, rendered his hopes futile, and his efforts unavailing. His mind, long overstrained, now sank at once under the burden he had so ungenerously laid on it, and he became incompetent to the fulfilment of any of his engagements." After a seclusion of two years, he revived for a time, and by avoiding all severe study or exciting occupation, afforded hopes to his friends that his mental powers were permanently restored. This gleam however lasted but three years, when he was once more assailed by the most woful of human maladies, and never recovered. He died in May 1821.

The productions of this original and ingenious composer are too numerous, and indeed too well known, to be particularised here: the choicest of them were, in 1824, collected and published in two handsome volumes, by his son-in-law, Mr. Horsley. Dr. Callcott left a widow, eight daughters, and two sons. One of the latter has attained considerable distinction in his father's art.

(Horsley, *Memoir of Dr. Callcott*; and *Harmonicon*, ix. 53.)

CALLENBERG, JOHANN-HEINRICH, was born January 12, 1761, in the principality of Saxony-Gotha. He studied at the university of Halle, and was appointed professor of philosophy in 1797, and professor of theology in 1799. At the period when he became professor of philosophy there was a very strong feeling among the members of the Protestant churches in favour of missions to the East, for the conversion of the Mohammedans and other inhabitants of those countries to Christianity. Callenberg, himself a Protestant with very decided religious sentiments, entered into these views with great enthusiasm; and being a man of property, established, at his own expense and on his own premises, a printing-office for the publication of works in Arabic and Hebrew, for the furtherance of the missionary cause. Here were printed translations into Arabic of portions of the Old Testament, the whole of the New Testament, Luther's Shorter Catechism, the 'Imitation of Jesus Christ' (somewhat curtailed), portions of Græcæ on the 'Truth of the Christian Religion,' the 'Remnants of the Arabic Language,' and other works necessary for those who as missionaries in the East had to communicate with many nations speaking those languages. He was also anxious for the conversion of the Jews to Christianity, and with that view wrote a 'Kurze Anleitung zur jüdischen Tenthlen Sprache' (Short Introduction to the Speech of the German Jew), Nov. 1799, to which he added in 1796 a short dictionary of the corrupt Hebrew spoken among themselves by the Jews of Germany, the former work being an elementary grammar of the same speech. He continued his labours in writing, translating, and printing a variety of works useful for the missionaries till his death, which occurred July 16, 1799. We have merely indicated a few of the works which issued from his press. A full notice of them would occupy much space. They were all directed to the promotion of the missionary cause, to which, with indefatigable zeal, he devoted the labours of his life. Callenberg wrote in German two works, in one of which he gives a detailed account of the means which had been used to convert the Jews to Christianity, and in the other of the labours of the missionaries among the Mohammedans.

CALAÏT, JEAN-FRANÇOIS, born at Versailles, October 25, 1744. His mother was stated by a family tradition to have been of the family of Des Cartes. He came to Paris in 1768, in 1784 he published his edition of Goullard's logarithms in octavo. In 1788 he was made treasurer of typography at Valence, and afterwards at Dunkirk. He returned to Paris in 1792, and was Professor des ingénieurs-géographes au Dépôt de la Guerre for four years. After the suppression of this place, he became a private teacher of mathematics.

In 1795 he published his stereotyped logarithms, with tables of logarithmic sines for the new decimal division of the circle, the first which had then appeared. He died November 14, 1798. (Lalande, 'Bibliog. Astron.', p. 805.)

The last logarithms of Callet ('Tables portatives de Logarithmes,' Paris, Firmin Didot, 1795) are still in general use, and are very convenient in many respects. The logarithms of numbers are arranged so that when the third figure changes, the line in which the remaining four figures are placed falls, so that the latter are opposite to their correct preceding figures. The logarithmic sines, &c., are to every ten seconds, sexagesimal as usual, the first five degrees being to every second.

CALLICRATIDAS, a Spartan officer who was appointed to succeed Lysander in the command of the Peloponnesian fleet in the Ægean Sea, A.C. 406, at the beginning of the twenty-fourth year of the Peloponnesian war. Of simple, straight-forward character, he was no match for Lysander and his friends in the arts of intrigue; and they used their best endeavours to perplex his plans and frustrate all his operations. So far as the caballing of his officers was concerned, he got over the difficulty by putting the simple question—whether they preferred that he should retain the command, or that he should sail home, and relate at Sparta the condition in which he found things? for none durst stand the chance of accusation at home. But for the pay of his fleet he was dependent upon Cyrus, the Persian commander-in-chief of the king's forces in western Asia Minor; and when he went to that prince at Sardis to obtain a supply of money, he was so disgusted by Asiatic pride, and ceremony, and dilatoriness, that, leaving the object of his journey unaccomplished, he returned to Miletus, saying that the Greeks were indeed miserable thus to cringe to barbarians for their money, and that if he lived to return home he would do his best to reconcile the Athenians and the Lacedæmonians. Having obtained a sum upon loan, he sailed to Lesbos, and took Methymne by assault. The town was given up to pillage. Callicratidas was urged to sell the citizens for slaves, according to the usual practice of Greek warfare; but he replied, that while he had the command no Grecian citizen should be made a slave. This liberal sentiment however did not influence him in regard to the Athenians; for Xenophon (if there is no error in the text) says in the next line that the Athenians who formed the garrison were sold. (See the note of F. A. Wolff on this passage.)

After this success Callicratidas met Conon, the Athenian commander, at sea, attacked him, gained a victory, and blockaded him in the harbour of Mytilene. Intelligence of this arriving at Athens, a powerful fleet of 110 ships was equipped and manned within the space of thirty days, and sent to the relief of Conon. Callicratidas left 50 ships to maintain the blockade, and with only 120 advanced to meet the enemy, whose number was increased by reinforcements from the allied states to 150 and upwards. The fleets met between Lesbos and the main land, near the small islands called Arginussa. Hermon, the master of Callicratidas's ship, recommended the Spartan commander to retreat without hazarding a battle. He replied, that if he were dead Sparta would be no worse off; but that it was base to fly. The battle was long and doubtful, but ended in the complete defeat of the Lacedæmonians, with the loss of 70 ships. Callicratidas perished in it, being thrown overboard by the shock of his own ship against one of the enemy. (Xenophon, 'Hellenicæ,' lib. i. c. 6.)

CALLIMACHUS, a celebrated Greek sculptor of uncertain age, but probably of about the time of Phidias. He was apparently an Athenian, though some claim him for Corinth, because he is recorded by Vitruvius as the inventor of the Corinthian capital. Callimachus is, on the other hand, supposed to have been of Athens, from a report noticed by Vitruvius, and in part by Pliny, and Pausanias, that the Athenians used to call him Catatechnos, Κατάτεχνος, because of the elegance and refinement of his style, or rather Catatexitechnos, Κατάτεξεχνος, according to the emendation of Sillig, (following the reading of one or two manuscripts) signifying one who weakens or effeminates an art, in allusion to the excessive finish by which he greatly injured the effect and value of his works. Pliny calls him the calumniator of himself, and says that he never knew when to leave off finishing his works; the same fault was found with Protogenes.

If Callimachus invented the Corinthian capital, this circumstance enables us, as Winckelmann has observed, in some degree to fix his time. It must have been before the 95th Olympiad, about 400 B.C., for Scopas then erected a temple of Minerva, according to Pausanias, with columns of the Corinthian order at Tegea; but it was probably not much earlier than that date, as his style was so elaborate and finished. There is a bas-relief in the capitol at Rome, with Καλλιμαχος εποιει engraved upon it, which represents a dance of three bacchantes and a fawn; and some have, with little probability, supposed this to be the same work which Pliny notices as a dance of Spartan virgins by Callimachus.

CALLIMACHUS, a Greek poet, was at the height of his reputation a little after the time of the first Punic war, 264 B.C. (Aul. Gell., xii. 21, 41.) We learn from Suidas the following particulars respecting him. He was the son of Battus and Mesatma, was born at Cyrene, and studied under Hermocrates of Inaus. His wife was the daughter of one Euphrates, a Syracusan; he had a sister called Megatima, who married one Stasenor; the offspring of this marriage

was a son, who bore the same name as his uncle, and wrote an epic poem on islands. Callimachus, before he was taken into favour by Ptolemy Philadelphus, by whom he was highly honoured (Strabo, p. 838), kept a school in a quarter of Alexandria called Eleusis, and had among his pupils Eratosthenes, Aristophanes of Byzantium, the celebrated grammarian, and Apollonius of Rhodes, the author of the 'Argonautica.' He was alive when Ptolemy Euergetes ascended the throne in B.C. 247.

It appears from an epigram attributed to Callimachus (Jacob's 'Anthol. Palat,' vol. i. p. 466) that his grandfather's name was also Callimachus; and the assertion of Suidas, that he was the son of Battus, is perhaps merely an inference from his epithet Battades, which may be explained from the fact that he believed himself descended from the founder of Cyrene (Strabo, p. 837). Of his numerous writings only some hymns and epigrams remain. Of his lost works, which are most quoted, we may mention his 'Hecale,' a long poem (on which we refer our readers to the learned papers by Nake in the 'Rheinisches Museum,' ii. 4, and iii. 4); his historical Memorials, which are also attributed to Zenodotus ('Athen.' iii. p. 95); a 'Treatise on Birds,' also quoted by Athenæus; and a 'List of all kinds of Writings' (*τῶν παντοδαπῶν συγγραμμάτων*), which consisted of 120 books; so that he doubtless merited the epithet 'well-informed' (*πολυειδής*), given him by Strabo (p. 438). He wrote an invective under the name of 'Ibis' against his scholar Apollonius, who had offended him, and the title was subsequently adopted by Ovid for a satirical poem of the same kind. As we might expect from the age and employments of Callimachus, his remaining poems display much more of grammatical art than of poetical imagination, although they are not without that kind of beauty which is the result of much labour and learning. The first edition of the Hymns of Callimachus was by John Lascaris, Florence, 4to., probably printed about A.D. 1500: this edition is printed in capital letters. The latest editions are that by Blomfield, 8vo, Lond. 1815; and a small edition by Volger, Leipzig, 1817, 8vo.

CALLISTHENES. [ALEXANDER III.]

CALLISTRATUS, a Roman jurist, who was writing under the joint reign of Severus and Antoninus (l. tit. 19, a. 8; 49. tit. 14, a. 3), by whom are meant Septimius Severus and his son Antoninus Caracalla. Severus died A.D. 211. Lampridius ('Alexander Severus,' 68), mentions a Callistratus as one of the Council of the Emperor Alexander Severus; and this may be the Callistratus under notice.

Callistratus is one of the Jurists from whose writings Justinian's 'Digest' was compiled: the works of Callistratus from which the excerpts in the 'Digest' are taken, were—six books 'De Cognitionibus'; six books of the 'Edictum Monitorium'; four books on the 'Jus Fisci'; three books of 'Institutiones'; two books of 'Questiones.' It appears from 'Institutiones' being mentioned as one of the works of Callistratus, that he was one of those Roman jurists who wrote institutional treatises, such as Gaius.

CALLOT, JACQUES, an eminent engraver, was born at Nanci, in 1592, of a family recently ennobled. His father discountenancing his choice of a profession, he fled from home in order to make his way to Rome, the capital of the fine arts. Falling in with a troop of gipsies, he travelled in their company as far as Florence, where a gentleman, pleased with his ingenuous ardour, placed him with an artist to study; but he soon left him for Rome. At Rome he met some acquaintances of his family, who compelled him to return home. He ran away a second time, and was a second time brought back, by his elder brother, whom he met at Turin. During his youthful adventures, as the story goes, his morals were preserved uncorrupted, by his constant prayer that he might grow up a good man, excel in his profession, and live to the age of forty-three. He set out a third time, with his father's tardy concurrence, and studied for a long time at Rome. On his way homewards he was detained for many years by Cosmo II. After the death of his patron he returned to Nanci, married, and fixed his residence among his friends. He acquired considerable wealth, and his fame was such that he was invited to witness and perpetuate the events of the siege of Breda, and afterwards the sieges of Rochelle and Rhé; but he declined to commemorate the subsequent capture of his native place, and likewise refused a pension and lodging at Paris, offered to him by Louis XIII. He died March 28, 1635, of complaints incidental to the practice of his art.

Callot possessed a lively and fertile invention, and he had a singular power of enriching a small space with a multitude of figures and actions. He engraved both with the burin and the needle; but by far his best works are free etchings, touched with the burin, delicately executed and sometimes wonderfully minute. There is a want of unity and breadth of effect in some of his larger engravings; indeed, he never seems to have acquired mastery over the graver, and engraved even fewer pictures than most of his profession, working chiefly from original designs. His principal works are the 'Sieges,' above-mentioned, the 'Miseries of War,' certain 'Festivities at Florence,' and a set of Capricci. He painted a few pictures, but they are extremely rare; they are of small size on copper, and painted with almost excessive neatness. Vandyck painted his portrait, which has been engraved by Boulonais and Vostermann. (Felibien; Perrault; De Haldat, &c.)

CALMET, AUGUSTINE, was born at Mesnil-la-Horgne, near

Commercy, in the modern department of the Meuse, on February 6th, 1672. He received the first rudiments of his education at the priory of Breuil; studied rhetoric at Pont-à-Mousson; and afterwards entered the Benedictine abbey of Mansuy, in the Fauxbourg of Toul, where he took the vows in 1689. Greek, Hebrew, philosophy, and divinity engrossed his time until 1704, when he was appointed sub-prior at the abbey of Munster, in which he appears to have diligently pursued his biblical studies. In 1707 he published in French the first volume of his commentaries upon the Bible. In 1715 he purchased the priory of St. Lay from the Abbé Morel, the king's almoner, for a pension of 3000 livres, and three years afterwards he was appointed abbé of St. Leopold of Nanci. His priory of St. Lay was surrendered by him when, in 1723, he was chosen abbé of Sénones, and he then also declined the title of bishop 'in partibus infidelium,' which was offered to him by Pope Benedict XIII., at the suggestion of the college of cardinals. He died in his abbey on the 25th of October 1757, greatly esteemed both for learning and for moderation. The following is a list of his principal works:—'Commentaire Littéral sur tous les livres de l'Ancien et du Nouveau Testament,' 1707-16, in 23 vols. 4to, Reprinted in Paris 1713, 26 vols. 4to, and 9 vols. fol.; and abridged in 14 vols. 4to. Rondet published a new edition of this abridgement. Avignon, 1767-78, 17 vols. 4to. The Dissertations and Prefaces belonging to his Commentary were published with 19 new Dissertations, Paris, 1720, 2 vols. 4to. 'Histoire de l'Ancien et du Nouveau Testament,' intended as an introduction to Fleury's 'Ecclesiastical History,' 2 and 4 vols. 4to, and 5 and 7 vols. 12mo. 'De la Poesie et Musique des Anciens Hebreux,' Amst. 1723, 8vo. 'Dictionnaire Historique, Critique, et Chronologique de la Bible, enrichi d'un grand nombre de figures en taille douce qui représentent les antiquités Judaïques,' 'Dictionnaire de la Bible,' &c., 2 vols. 4to, Paris, 1722. 'Supplement à ce Dictionnaire,' 2 vols. 4to, Paris, 1728. Reprinted in 4 vols. 4to, Paris, 1730. This very valuable work was translated into English, under the title 'Historical, Geographical, Critical, Chronological, and Etymological Dictionary of the Holy Bible.' To which is added 'Bibliotheca Sacra,' or a catalogue of the best editions of the Bible, and commentaries upon it translated by J. D. Oyley and J. Calson, with cuts, London, 1732, 3 vols. folio. Three or four more recent English versions founded upon this, but having various notes and additions, have been since published in London: perhaps the best is that published under the editorial care of Mr. I. Taylor. 'Histoire ecclésiastique et civile de la Lorraine depuis l'entrée de Jules César dans les Gaules jusqu'à la mort de Charles V. Duc de Lorraine; avec les pièces justificatives à la fin,' Nancy, 1728, 4 vols. fol. Reprinted 1745 in 5 vols. fol. 'Bibliothèque des Ecrivains de Lorraine,' 1751, folio. 'Histoire Universelle Sacrée et Profane,' 35 vols. 4to. This undertaking Calmet did not live to finish, and, in other respects, it is not his best work. 'Dissertations sur les Apparitions des Anges, des Démons, et des Esprits, et sur les Revenans et Vampires de Hongrie,' Paris, 1746, 12mo; Einsiedlen, 1749, 12mo; Paris, 1751, 2 vols. 12mo. Translated and published in English in 1759, 8vo. 'Commentaire Littéral, Historique, et Moral, sur la Règle de St. Benoît,' 1754, 2 vols. 4to. Perhaps the most useful of Calmet's works, certainly the one most familiar to the English reader is the 'Dictionary of the Bible.' All his works indeed are replete with learning, but should be read with some degree of caution. Calmet was deeply imbued with fanciful and rabbinical theories. Though a man of great learning he had a strong leaning to the marvellous, and his tendency to superstition was not controlled by a sound judgment. Voltaire, in his usual lively manner, describes him as a man who does not think, but furnishes others with materials for thinking.

CALOGERA, ANGELO, born at Padua in 1699, of a family originally from Corfu, studied at Venice, and entered at an early age the monastery of St. Michele, near Murano, which belonged to the order of the Camaldulenses. After having taken his vows, he was sent to Ravenna to teach theology, where he acquired a large store of varied literary knowledge, and formed many valuable acquaintances. Calogera, after some years, returned to his monastery of St. Michele, where he spent the greater part of his remaining life in his favourite literary studies. He was induced to compile an annual selection from the numerous papers which were read in the various scientific and philological academies scattered about Italy, and which, for want of a common journal, remained buried and forgotten in their respective archives. Calogera undertook the task, in which he was assisted by Pier Caterino Zeno, Faccioli, Vallisneri, Muratori, Manni, and other learned contemporaries. He began to publish in 1728, at Venice, the 'Raccolta d'Opuscoli Scientifici e Filologici,' which continued to appear periodically till 1753, when the series closed by its fifty-first volume, which contains an index of the whole collection. He resumed it however in 1754, under the title of 'Nuova Raccolta d'Opuscoli Scientifici e Filologici,' which he carried on to the time of his death, in 1768, after which it was continued by his co-religionist Father Mandelli till 1784, when the fortieth and last volume of this second series appeared. The two series constitute an ample store of Italian learning during the 18th century. Amidst many papers which have only a local and temporary interest, there are many others which are truly valuable, and which could not be found anywhere else. Calogera wrote also a kind of literary journal entitled 'Memorie per servire alla Storia Letteraria;' he wrote with Apostolo Zeno in the journal 'La

Minerva,' and he also contributed to a new edition of the 'Biblioteca volante' of Cacciari. Calomarde was appointed in 1780 Revisore or book Censor for the Venetian State. He left a voluminous correspondence, which is inedited. (Lombardi, *Storia della Letteratura Italiana nel Secolo XVIII.*)

CALOMARDE, FRANCISCO TADEO, the leading minister of the Spanish cabinet for ten years under Ferdinand VII., was born at the town of Vilhel, in Lower Aragon, on the 10th of February 1773. His parents were so poor, that when he became a student of law at the university of Saragossa he was obliged to eke out his means of subsistence by officiating in off hours as a lady's page. A story is told in his life, by Cardenas, that one evening some merchants of Teruel, who learned that the page who was carrying the lantern to light them to his mistress's evening party was studying the law, asked him what he aimed at becoming; and that the youth replied, with much gravity, "Minister of grace and justice." This was considered so preposterous, that it was repeated amid roars of laughter at the party, and served as a standing jest against Calomarde, more especially as his abilities as a student were far from remarkable. But when he removed to Madrid to practice as a lawyer, the young Aragonese soon found a path to fortune by marrying the daughter of Beltran, another Aragonese, the physician to Godoy, then in the zenith of his power as the reigning favourite, and though in the course of a few months he parted with his wife for ever, he remained fixed in the office to which his father-in-law had introduced him. The French invasion drove him to Cadiz; and his rejection as a candidate for the first Cortes is said to have turned him from an adherent of the liberal into one of the absolutist party. Through the stormy years that followed he was sometimes in power in inferior offices, and sometimes in banishment and disgrace, till, on the fall of the constitutional government by the armistice of the Duke of Angoulême, and the restoration of absolute power under Ferdinand, Calomarde finally attained his object, and was named in 1823 to the post he had aspired to in boyhood, in succession to the Marquis of Casa Irujo, whose death proved a serious loss to Spain. It was while Calomarde was minister of grace and justice, that, on the 31st of July 1826, an unhappy schoolmaster named Antonio Ripoll was executed at Valencia for denying the Trinity and other leading doctrines of the church—the only *auto-da-fé* for the last thirty years in Spain. The disgrace of most of the measures of the period, from 1823 to 1833, which was a period of marked retrogression in every point of view, belongs to Ferdinand and Calomarde; but it is not easy to decide in what proportions, as it is asserted by some that the minister was merely an obsequious tool—by others, that he often prompted the malignant passions of the king. His principal care appears to have been to keep himself in place, and to promote as many Aragonese as possible, a propensity which was the subject of Ferdinand's frequent sarcasm. His long term of power came to an end with an event which was not only a crisis in the life of Calomarde, but a most momentous crisis in the history of Spain. King Ferdinand had revived in favour of his daughter by Queen Christina, the present Queen Isabella, the law which allowed of the female inheritance of the crown—a law which had been abolished by treaty with French powers at the peace of Utrecht, but secretly agreed to be resumed by king and cortes towards the close of the 18th century. In September 1833, when the king considered himself on his death-bed, his mind was agitated by the thought of the probable consequences of this arrangement, which deprived his brother Don Carlos, the favourite of the absolutists, of the succession to the throne. He asked the advice of Calomarde, who told him that the royalist volunteers, the supporters of the absolute party, had arms in their hands, that they numbered 20,000 men, and that it was useless to expect they would consent to see the succession altered without a civil war, which would very probably bring on the total destruction of the opposite party. The Queen Christina herself was brought to assent to this view of things, and the king caused a document to be drawn up in the nature of a codicil to his will, which restored the male line of succession, but he strictly commanded that it should be kept entirely secret till after his death. The next day the king was seized with a lethargy, and lay insensible for many hours, nor was it supposed by any around him that he would ever recover. Impatient to worship the rising sun, Calomarde communicated the contents of the important document to Don Carlos, and crowds flocked to the palace of the prince to secure their future fortunes; the momentous intelligence became public, and roused all the apprehensions of the liberals of Madrid. The queen's sister, the Princess Luisa Carlota of Naples, wife of the king's brother Don Francisco, was a woman of strong passions and masculine resolution: she hurried to the palace of San Rafael, where Ferdinand was lying, now recovering from his lethargy, summoned Calomarde to her presence, reproached him with his treachery, and told him not to flatter himself that his baseness would escape its deserved chastisement. The princess next sent for the codicil and tore it to pieces with her own hands. When this could be done with impunity, Calomarde might augur what he had to expect: he secretly left the palace, was concealed for some days in Madrid, then took refuge in a convent, and finally made his way in disguise to the frontier, pursued by officers with the king's orders for his confinement in the citadel of Minorca. A sergeant and party of soldiers arrested him on the border of France, but were prevailed

upon with the promise of a sum of money to let him pass, for which they were afterwards dismissed the service in disgrace. Calomarde's exertions in Don Carlos's cause failed to procure him the favour of Don Carlos. When, after the death of Ferdinand, the civil war broke out in the Basque provinces, he quitted France to offer his services at the head-quarters of the Pretender, he was refused even an interview, it is supposed from resentment at his weakness in allowing himself to be too easily defeated. With the exception of a visit to Rome, the rest of his life was spent in France, chiefly at Toulouse, where his very liberal charities to all his countrymen earned him the title of Father of the Spaniards, and where, after some years of dejection, he died on the 21st of June 1842, regretted by none but the recipients of his bounty.

CALONNE, M. DE, was born at Douai about the middle of the 18th century. Having attained distinction as a lawyer, he was made successively attorney-general to the parliament of Douai, intendant of Metz, inspector-general of finances, treasurer, and lastly minister of state. He found the finances in a state of great embarrassment, and being unable to fill up the deficit, he advised Louis XVI. to convoke the assembly of the notables in 1787, before whom he made his well-known statement of the financial affairs of the kingdom. Being taxed with prodigality and malversation, he was dismissed by the king, and was succeeded by Brienne. Calonne retired to Flanders, and afterwards to England, where he spent the greater part of his latter years, and wrote numerous political and financial pamphlets. Although belonging to the royalist party, he was not extravagant in his opinions, and he therefore incurred the enmity of the more violent royalists. His 'Tableau de l'Europe en Novembre,' 1795; 'Pensées sur ce qu'on a fait et ce qu'on n'aurait pas dû faire,' 8vo, 1796; 'Des Finances publiques de la France,' 1797, &c., afford materials for the history of those times. In 1802 he obtained leave of Bonaparte to return to France, where he died in October of the same year.

CALPURNIUS, TITUS JULIUS, a Latin poet and a native of Sicily, has left eleven eclogues, written somewhat in the manner of Virgil's, whom he seems to have imitated. He is believed to have lived in the 3rd century, and enjoyed the favour of the emperor Carus; but nothing very definite is known respecting him. His Latinity is better than his taste, and his language more tolerant than his subject or his mode of treating it. These eclogues have often been edited, and are printed in the 'Poete Latini Minores' of Burmann. An excellent revision of the text was published by Glaeser, Göttingen, 1842.

CALVERT, DENIS, sometimes called **FIAMMINGO**, a distinguished painter in his time, especially in landscape, was born at Antwerp about 1555, or, according to Oretti, in 1565. He settled early in Bologna, and studied there, first with Fontana, and afterwards with Sabbatini, with whom he visited Rome and assisted in some works there. After a stay of some time in Parma, Calvert returned to Bologna and opened a school there, which became very celebrated, and was numerously attended: he is said to have taught 137 painters. His school was unrivalled in Bologna until the establishment of the famous school of the Carracci, which in a few years completely superseded it. Some of the greatest scholars however of the Carracci had been students in the school of Calvert, as Domenichino, Guido, and Albani, three of the most famous of the Bolognese painters.

Calvert died at Bologna in 1619. He is spoken of with great respect by Malvasia and other Italian historians of art. There is nothing peculiarly Flemish in his style, unless it be his colour, in which he excelled, and on account of which he was greatly esteemed by the Bolognese painters. His pictures, of which there are still several in Bologna, are strictly in an Italian style of design; in landscape he was superior to any of his Bolognese contemporaries. His masterpieces are a St. Michael in the church of San Petronio, and a Purgatory alle Grazie. The majority of his pictures were of small size and painted on copper.

(Malvasia, *Felsina Pitttrice*; Lanzi, *Storia Pittorica*, &c.)

CALVERT, GEORGE. [BALTIMORE, LORD.]

CALVIN, JOHN, was born on the 10th of July 1509, at Noyon in Picardy, where his father, Gerard Cauvin, was by trade a cooper. His parents being of respectable character, but in humble circumstances, young Calvin, who had early shown a pious disposition, was taken under the protection of a family of wealth in the place, and sent by them to the University of Paris to study for the church. At the age of twelve he obtained from the bishop a benefice in the cathedral of Noyon, to which, in about five years afterwards, was added the cure of Monteville; but this he exchanged two years after for the cure of Pont-l'Évêque. All this time he was pursuing his studies, and had not even received priest's orders. His father now changed his mind as to the destination of his son, and desired him to turn his attention to the law as the sure road to wealth and honour. This change was not unacceptable to Calvin, who, from his perusal of the Scriptures—a copy of which was furnished him by Robert Olavetan, who was a fellow-scholar, and likewise a native of Noyon—had already been convinced of many of the errors of the Romish Church. He accordingly left Paris, and repaired first to Orléans, where he studied under Peter Stella, and then to Bruges, where Andrew Alciat filled the chair of law; and where also, which was more important to Calvin's future character, Milchior Wolmar, the reformer, taught him the Greek

tongue. Here Calvin was confirmed in the doctrines of the Reformation, and began indeed to preach them in the villages. His father however dying at this time, he returned to Noyon, but after a short period went to Paris, where, in the year 1532, he published his *Commentaries on Seneca's two books, 'De Clementia.'*

Calvin now resigned his benefices, and devoted himself to divinity. The following year, Cop, the rector of the University of Paris, having occasion to read a public discourse on the festival of All Saints' Day, Calvin persuaded him to declare his opinion on the new doctrines. This brought upon them both the indignation of the Sorbonne and parliament, and they were forced to leave the city. Calvin went to several places, and at length to Angoulême, where he got shelter in the house of Louis du Tallet, a canon of Angoulême, and supported himself some time there by teaching Greek. It was there he composed the greater part of his '*Institutes of the Christian Religion*,' which were published about two years afterwards. The Queen of Navarre, sister to Francis I., having shown him some countenance in respect of his learning and abilities, and no doubt also of his sufferings, he returned to Paris in the year 1534 under her protection; but persecution being again threatened, he quitted France the same year, having first published a work, which he called '*Psychopannychia*,' to confute the error of those who held that the soul remained in a state of sleep between death and the resurrection, and retired to Basel in Switzerland, where he published the '*Institutes*,' which he dedicated to Francis I., in an elegant Latin epistle. The design of the '*Institutes*' was to exhibit a full view of the doctrines of the reformers; and as no similar work had appeared since the Reformation, and the peculiarities of the Romish Church were attacked in it with great force and vigour, it immediately became highly popular. It soon went through several editions; it was translated by Calvin himself into French, and has since been translated into all the principal modern languages. Its effect upon the Christian world has been so remarkable as to entitle it to be looked upon as one of those books that have changed the face of society.

After the publication of this great work Calvin went to Italy to visit the reformers there, and was received with marked distinction by the learned Duchess of Ferrara, daughter of Louis XII. But notwithstanding her protection, the Inquisition opened upon him, and he was obliged to seek safety in flight. He returned to France, but soon left it again, and in the month of August 1536 arrived at Geneva, where the reformed religion had been the same year publicly established. There, at the urgent request of Farel, Viret, and other eminent reformers, by whom that revolution had been achieved, he became a preacher of the Gospel, and professor, or rather lecturer on divinity. Farel was then the most distinguished person in the place; he was twenty years older than Calvin, who was in the twenty-seventh year of his age; but their objects were the same, and their learning, virtue, and zeal alike, and these were now combined for the complete reformation of Geneva, and the diffusion of their principles throughout Europe. In the month of November a plan of church government and a confession of faith were laid before the public authorities for their approval. Beza makes Calvin the author of these productions; but others, with perhaps greater reason, attribute them to Farel. There is little doubt however that Calvin was consulted in their composition, and still less that he lent his powerful aid to secure their sanction and approval by the people in the month of July 1537. The same year the Council of Geneva conferred on Farel the honour of a Burgess of the city, in token of their respect and gratitude. But the popular will was not prepared for the severe discipline of the reformers, and in a short time the people resisted some innovations on their religious practices, and, under the direction of a faction, met in a public assembly and expelled Farel and Calvin from the place.

Calvin repaired to Berne, and then to Strasbourg, where he was appointed professor of divinity and minister of a French church, into which he introduced his own form of church government and discipline. In his absence great efforts were made to get the Genevese to return to the communion of the Church of Rome, particularly by Cardinal Sadolet, who wrote to them earnestly to that effect; but Calvin, ever alive to the maintenance of the principles of the Reformation, disappointed all the expectations of his enemies, and confirmed the Genevese in the new faith, addressing to them two powerful and affectionate letters, and replying to that written by Sadolet. While at Strasbourg also Calvin published a treatise on the Lord's Supper, in which he combated the opinions both of the Roman Catholics and Lutherans, and at the same time explained his own views of that ordinance. Here too he published his '*Commentary on the Epistle to the Romans*.' Calvin got acquainted with Castalio during his residence at Strasbourg, and procured for him the situation of a regent at Geneva; and it was during his stay in this city that by the advice of his friend Bucer he married Idellet, the widow of an Anabaptist preacher just deceased.

In November of the same year he and Farel were solicited by the Council of Geneva to return to their former charge in that city; in May 1541 their banishment was revoked; and in September following Calvin was received into the city amidst the congratulations of his flock, Farel remaining at Neuchâtel, where he was loved and respected. Calvin did not trifle in the peculiarly favourable circumstances in which

he was now placed. He immediately laid before the council his scheme of church government, and after it was adopted and published by authority, which was on the 20th of November 1541, he was unhesitating in its enforcement. His promptitude and firmness were now conspicuous; he was the ruling spirit in Geneva; and the church which he had established there he wished to make the mother and seminary of all the reformed churches. His personal labours were unceasing; he preached every day for two weeks of each month; he gave three lessons in divinity every week; he assisted at all the deliberations of the consistory and company of pastors; he defended the principles of the reformation against all who attacked them; he explained those principles both in writing and discourse; and maintained a correspondence with every part of Europe. Geneva however was the common centre of all his exertions, and its prosperity peculiarly interested him, though less for its own sake than to make it a fountain for the supply of the world. He established an academy there, the high character of which was long maintained; he made the city a literary mart, and encouraged the French refugees and others who sought his advice to apply themselves to the occupation of a printer or librarian; and having finished the ecclesiastical regimen, he directed his attention to the improvement of the municipal government of the place. That Calvin should, in the circumstances in which he was now placed, show marks of intolerance towards others is not surprising; and to seek a palliation of his guilt we need not go back to the time when he belonged to the Church of Rome, nor yet to the notions of civil and religious liberty prevalent in his age. We have only to reflect on the constitution of the human mind, and the constant care necessary to prevent power in any hands from degenerating into tyranny. His conduct towards Servetus [SERVETUS] has been justly condemned, and has drawn down upon him the epithet of 'a most cruel and atrocious monster'; yet the punishment of Servetus was approved of by men of undoubted worth, and even by the mild Melancthon. In 1554, the year following Servetus's death, Calvin published a work in defence of the doctrine of the Trinity against the errors of Servetus, and to prove the right of the civil magistrate to punish heresy; Beza the same year published a work on the like subject, in reply to the treatise of Castalio. Of all the testimonies to the merits of Calvin at this time, the most unsuspected is that of the canons of Noyon, who in 1556 publicly returned thanks to God on occasion of his recovery from an illness which it was thought would prove mortal. The state of Calvin's health prevented him going in 1561 to the famous Conference of Poissy; an assembly which in his view promised to be of so much consequence, and which was indeed remarkable in this respect, that from that time the followers of Calvin became known as a distinct sect, bearing the name of their leader. Amidst all his sufferings however, neither his public functions nor his literary labours ceased: he continued to edify the church of Geneva by his sermons and his intercourse among the people, and to instruct Europe by his works; and to the last he maintained the same firmness of character which had distinguished him through life. On his death-bed he took God to witness that he had preached the gospel purely, and exhorted all about him to walk worthy of the divine goodness: his delicate frame gradually became quite emaciated, and on the 27th of May 1564 he died without a struggle, in the fifty-fifth year of his age.

The person of Calvin was middle-sized and naturally delicate; his habits were frugal and unostentatious; and he was so sparing in his food, that for many years he had only one meal in the day. He had a clear understanding, an extraordinary memory, and a firmness and inflexibility of purpose which no opposition could overcome, no variety of objects defeat, no vicissitude shake. In his principles he was devout and sincere, and the purity of his character in private life was without a stain. His writings are very numerous; but except his '*Christian Institutes*,' his commentaries on the Bible, and a few others, they have long been covered with undisturbed dust, though in their day none of his works were without their influence. There have been various collections of his works. In 1552 all his minor pieces, or '*Opuscula*,' were collected and published at Geneva. In 1576 a similar collection was made of his theological tracts; and the same year Beza published a collection of his letters, with a life of Calvin. We find also in Senebier ('*Hist. Lett. de Geneve*,' tom. i.) not only a list of all Calvin's publications, but a catalogue of sermons preached by him which yet remain in manuscript in the public library of Geneva. Calvin's '*Commentaries on various books of the Old and New Testaments*,' his '*Tracts relating to the Reformation*,' his '*Institutes*,' and some others of his writings, have been newly translated into English, or the old translations revised, and published within the last twelve or fourteen years under the auspices of the Calvin Translation Society at Edinburgh. But perhaps a still more important work as illustrating the character of the man and his times is a new edition of his letters, now in course of publication, including a very great number previously inedited:—'*Letters of John Calvin*,' compiled from the original manuscripts, and edited with historic notes by Dr. J. Bonnet; translated by D. Constable, 8vo, Edinb., 1855, &c.

It remains to notice briefly the system of religious doctrine and church government maintained by Calvin and his followers. Calvin, as we have seen, published his system in his '*Christian Institutes*' in the year 1536; but it does not appear to have obtained the name of

Calvinism, nor its supporters the name of Calvinists, till the conference of Pavia in 1541. The reformer was not himself present at that assembly, being prevented from attending by his local duties and the ill state of his health; but we see from his correspondence with Bera, the deputy from Geneva, how deep was his interest in its proceedings, and that nothing was done on the part of the reformers without his knowledge and advice. In the debate which took place on the Augsburg Confession, the points of difference between the Lutherans and Calvinists were drawn out; and they were such as that from then forth the latter became known as a distinct sect under that denomination.

The tenets of Calvinism respect the doctrine of the Trinity, predestination, or particular election and reprobation, original sin, particular redemption, effectual or irresistible grace in regeneration, justification by faith, and the perseverance of saints; together also with the government and discipline of the church, the nature of the sacraments, and the qualification of those entitled to partake of it. The great leading principles of the system however are the absolute decrees of God, the spiritual presence of Christ in the eucharist, and the independence of the church.

Calvinism was, perhaps, like Lutheranism, exemplified first at Strasbourg; where, in the year 1538, Calvin established a French church on his own plan. But it was at Geneva that the system was seen in all its rigour; and from thence it spread into France, Germany, Prussia, the United Provinces, England and Scotland. To this last place it was carried by Knox, the disciple and intimate correspondent of Calvin; and as within the little territory of Geneva there was neither room nor need for the parochial sessions, presbyteries, provincial synods and general assembly, into which the presbyterian government expands itself in a large community, we shall briefly advert to its leading features in Scotland, as it appeared there in the lifetime of Knox. We shall thus indeed see the Church of Scotland in its infancy; but at the same time,—and it is that we have chiefly in view,—we shall thus perhaps have the best idea of the matured opinions of the great reformer.

The Confession of Faith, ratified by the Scots parliament in 1560, declares that by the sin of our first parents, "commonly called original sin, the image of God was utterly defaced in man, and he and his posterity of nature became enemies of God, slaves to Satan, and servants unto sin; inasmuch that death everlasting has had, and shall have, power and dominion over all that have not been, are not, or shall not be, regenerated from above, which regeneration is wrought by the power of the Holy Ghost working in the hearts of the elect of God an assured faith in the promise of God revealed in his word;" that "from the eternal and immutable decree of God all our salvation springs and depends;" "God of mere grace electing us in Christ Jesus his son before the foundation of the world was laid;" and that "our faith and the assurance of the same proceeds not from flesh and blood, that is to say, from our natural powers within us, but is the inspiration of the Holy Ghost;" "who sanctifies us and brings us in all verity by his own operation, without whom we should remain for ever enemies to God and ignorant of his son Christ Jesus; for of nature we are so dead, so blind, and so perverse, that neither can we feel when we are pricked, see the light when it shines, nor assent to the will of God when it is revealed, unless the spirit of the Lord Jesus quicken that which is dead, remove the darkness from our minds, and bow our stubborn hearts to the obedience of his blessed will;" "so that the cause of good works we confess to be not our free will, but the spirit of the Lord Jesus, who dwelling in our hearts by true faith, brings forth such works as God has prepared for us to walk in;" and "who boast themselves of the merits of their own works, or put their trust in works of supererogation, boast themselves in that which is not, and put their trust in damnable idolatry." It further admits that "we now, in the time of the evangel, have two chief sacraments only, to wit, Baptism and the Lord's Supper; by the former of which "we are ingrafted in Christ Jesus to be made partakers of his justice, by which our sins are covered and remitted;" and in the latter it is asserted there is a real though only spiritual presence of Christ, and "in the supper rightly used, Christ Jesus is joined with us, that he becomes very nourishment and food of our souls." The marks of a true church are said to be the true preaching of the word of God, the right administration of the sacraments, and ecclesiastical discipline rightly administered as the word of God prescribes. The polity or constitution of the church however is not detailed; this was done in the 'Book of Discipline' drawn up by Knox and his brethren. The highest church judicatory is the General Assembly, composed of representatives from the others, which are provincial synods, presbyteries, and kirk sessions. The officers of the church are pastors or ministers, doctors or teachers, and lay elders, to which are to be added lay deacons, for the care of the poor. Among the clergy there is a perfect parity of jurisdiction and authority, and in the church courts clergy and laity have equal voices. The minister and the elder indeed are both presbyters—the one a preaching presbyter, and the other a ruling presbyter; and it will be remembered that when Bucer expressed his approbation of the episcopal hierarchy of England, Calvin said it was only another papacy. Another principle, recognised alike by Calvin and the reformers of Scotland, was the education of the people; which both seem to have regarded as the rock upon which

the reformed church should be built; and in Scotland, as was fit, this foundation was as broad as the building, it being meant that, besides the universities of the kingdom, there should be in every district a parish church and a parish school.

CAMBACÈRES, JEAN JACQUES DE, was born at Montpellier in 1753. His father was an advocate, and brought him up to the same profession, in which he soon distinguished himself, and was made Counsellor of the Cour des Comptes of Montpellier. When the revolution broke out he was elected deputy to the Legislative Assembly, and afterwards to the Convention, where he voted for the death of Louis XVI., but with a conditional reprieve. In the subsequent period of terror he endeavoured, though cautiously, to bring back the Assembly to legal measures, and to check arbitrary acts. He afterwards sat in the Council of Five Hundred, and was made Minister of Justice under the Directory, in which capacity he greatly assisted Bonaparte in the revolution of the 18th Brumaire. From that moment he followed the fortunes of Napoleon, and was among his most useful and subservient instruments: he was also one of the few who remained faithful to him to the last. In his capacity of Great Chancellor of the empire, he had to communicate to the senate all Napoleon's measures for peace or war, including his frequent demands for fresh conscriptions of men, which were sanctioned by that docile assembly. Cambacères was one of the compilers of the civil code, for which his legal knowledge rendered him very well qualified. He had already written, in 1796, a 'Projet de Code Civil,' which became in a great measure the basis of the new code. After Napoleon's first abdication in 1814, Cambacères lived in retirement at Paris. When Napoleon returned from Elba, he appointed Cambacères Minister of Justice, notwithstanding his excuses. After the king's second return, Cambacères withdrew again to private life, and in February 1816, he went to reside at Brussels, being included in the list of those who were exiled from France for having voted for the death of Louis XVI. However in May 1818, the king reinstated Cambacères in all his civil and political rights, in consequence of which he returned to Paris, where he died in 1824. His manners were courteous and pleasing: he was liberal and hospitable, and had the reputation of giving the best dinners of any of the ministers and great officers of the empire.

CAMBIA'SO, LUCA, sometimes called LUCHETTO DA GENOVA, a very celebrated Italian painter in fresco and in oil, was born at Monciglia near Genoa, on St. Luke's day, in 1527. He was instructed by his father Giovanni, a painter of considerable merit, and distinguished himself even when a boy, and though he is not known to have visited Rome in his youth, his best works have many of the qualities of the Roman masters. After a long and honourable career at Genoa, where he was without a rival, he went, in 1583, to Spain, with his son Orazio, and L. Tavarone, one of his pupils, to assist him in some works which Philip II. had commissioned him to execute in the Escorial. Cambiaso was invited to Spain by Philip II. to supply the place of his old friend and fellow-labourer G. B. Castello, of Bergamo, who died in Madrid in 1579. Cambiaso and Castello executed several paintings together in Genoa.

Cambiaso executed several works in the Escorial, the largest of which was an immense fresco of Paradise, containing a vast number of figures, arranged as the monks desired on the ceiling of the choir of the church of San Lorenzo. He received 12,000 ducats for this picture, yet it occupied him only fifteen months; it was however in the opinion of Menga much inferior to his best works in Genoa: the composition is formal and bad, but for this the monks must be held responsible. The oil painting of 'John the Baptist preaching in the Wilderness,' also in the Escorial, is the best of his Spanish works. He died at the Escorial in 1585, and Philip greatly regretted his loss. He was called Cangiaso by the Spaniards. He was a painter of surprising facility and power; Armenini compared him with Tintoretto; he painted however latterly with great negligence. Cambiaso's masterpiece is considered the 'Martyrdom of St. George' in the church of San Giorgio at Genoa. 'The Rape of the Sabines,' in Terralba near Genoa, is also a magnificent and celebrated work. His portrait by himself is in the Florentine gallery: several of his works have been engraved.

(Soprani, *Vite de' Pittori*, &c.; Coan Bermudes, *Diccionario Historico*, &c.)

CAMBYSES (*Kambysons*), the second king of the Medes and Persians, succeeded his father Cyrus B.C. 529. He led an army against Egypt (B.C. 525), defeated the Egyptian king Psammetichus in a great battle, and reduced Egypt to the form of a Persian province. The ruin of many of the monuments of Egypt is attributed, and perhaps to a certain extent correctly, to the fury of the barbarian invaders and of their king, who was mad. From Egypt Cambyses marched southwards against the Macrobians Ethiopians (a people whose geographical position is not certain), but his army, after suffering the severest privations in the deserts, returned to Thebes with much diminished numbers. A detachment of the Persian army which was sent from Thebes against the Ammonians (Siwah) was lost in the desert. After committing numberless extravagancies in Egypt, putting his brother Smerdis to death, marrying his sister, which was contrary to the Persian custom, and then killing her by a kick during her pregnancy, Cambyses died (B.C. 521) of an accidental wound from his

own sword at Ecbatana, a town of Syria (not Ecbatana the capital of Media). Ctesias says that Cambyzes died at Babylon.

Compare with Herodotus (iii.), which is the authority for what is here stated, the account of Ctesias, 'Persica.'

CAMDEN, CHARLES PRATT, EARL OF, was a younger son of Sir John Pratt, who was successively a puisne judge of the court of King's Bench and chief justice of that court, in the reign of George I. He was descended from a family of consideration in Devonshire, of which county Chief Justice Pratt, his father, was a native. Charles Pratt was born in the year 1714. He went at an early age to Eton, where he formed with William Pitt a warm friendship which lasted through life. In 1731, having obtained the election to King's College, Cambridge, he removed to the university. He became a fellow, according to the usual routine, in 1734; in the summer of 1738 he was called to the bar, and in the following year took his Master's degree. He made his first entrance into the profession in the courts of common law, and travelled the western circuit for several years with little or no practice. Conceiving his prospects of success in the profession of the law to be hopeless, he at one time resolved to abandon it and seek his fortune in the church. Henley, afterwards Lord Chancellor Northampton, who was at that time in considerable practice on the western circuit, is said to have dissuaded him from the execution of this purpose, and to have induced him to continue in his course until his turn for business and advancement should arrive. He had the good sense to follow this judicious advice, and shortly afterwards his business began to increase. His practice as a junior however appears never to have been considerable. His name appears occasionally in the reports of cases of parochial settlement from the western circuit. In 1752 he was employed as junior counsel in defence of Owen, the bookseller, who had been prosecuted by the attorney-general for publishing a libel upon the House of Commons (Howell's 'State Trials,' vol. xviii., p. 1203), and his earnestness and eloquence were believed to have mainly contributed to obtain a favourable verdict for his client. From this time his success was assured. In the following year he appeared as counsel for the prisoner in the trial of Timothy Murphy for forging a will, a case which excited much attention at the time (Howell's 'State Trials,' vol. xix., p. 693). Still previously to his appointment as attorney-general, he had much less general practice in the courts of Westminster Hall than several advocates whom at a subsequent period of his life he left far behind him in professional advancement. In the course of the change of administration which took place in June 1757, Sir Robert Henley, the early friend and adviser of Pratt, was promoted from the office of attorney-general to that of lord keeper; and upon occasion of this vacancy, his friend Pitt, who placed great confidence in him, insisted upon his being made attorney-general; and he was immediately afterwards returned to parliament as representative of the now abolished borough of Downton, in Wiltshire. During the four years that he continued to be a member of the House of Commons he did not take any very active or distinguished part in the debates.

His professional business while he was attorney-general became very extensive, particularly in the court of chancery. His official conduct as attorney-general appears to have been uniformly judicious and moderate. The only ex-officio information for libel filed by him was instituted against Dr. Shebbeare for his 'Letter to the People of England;' of which Horne Tooke says (Howell's 'State Trials,' vol. xx., p. 708), "that if ever there was an infamous libel against government surely it was that." The death of Chief Justice Willes, at the close of 1761, caused a vacancy on the bench of the common pleas; and this being one of those judicial offices of which by long usage the attorney-general for the time being is considered to have the refusal, it was accordingly offered to Pratt, and accepted by him. Soon after his elevation to the bench the great question respecting the legality of general warrants was raised, by the proceedings of government with relation to the celebrated John Wilkes. Lord Chief Justice Pratt expressed his opinion against the asserted power of the secretary of state to authorize arrests, or the seizure of papers upon general warrants, with a greater degree of warmth than was usual, or perhaps justifiable, in pronouncing a mere judicial decision; but his energy on this occasion was entirely in accordance with the prevailing feeling of the times, and produced for him a larger share of popular favour than had been possessed by any judge in England since the revolution. Addresses of thanks were voted to him by many of the principal towns, and several public bodies presented him with the freedom of their respective corporations. The city of London, in particular, placed his portrait in Guildhall, with an inscription in honour of the "maintainer of English constitutional liberty."

When the Rockingham administration came into power, in the summer of 1765, Lord Chief Justice Pratt was raised to the peerage by the title of Baron Camden, of Camden-place, in the county of Kent. He did not however by any means become an adherent of that ministry; on the contrary, he made a vigorous opposition to their measures declaratory of the right of Great Britain to impose laws upon the American colonies in all cases whatsoever. When Lord Rockingham's ephemeral administration broke up in July 1766, Lord Northampton, being removed from the court of chancery, became president of the council; and upon the occurrence of this vacancy, the seals were given to Lord Camden.

The Duke of Grafton's administration, composed as it was of the most heterogeneous materials, contained within itself the elements of its dissolution; and its fall was accelerated by the proceedings of the House of Commons relating to John Wilkes, and the measures respecting America, both of which had excited a violent fermentation in the public mind. Upon the opening of the session of 1770, Lord Camden declared in the House of Lords his opposition to government, and actually voted for Lord Chatham's amendment to the ministerial address. Such a declaration by the lord chancellor, accompanied by an unequivocal act of hostility to the government, necessarily led to his removal from the woolsack.

Lord Camden as judge in the court of chancery has won high praise from the profession. Only one of his decisions was reversed, and that reversal Lord Eldon is said by Lord Campbell to have pronounced probably wrong. His manner in the court was simple, unaffected, perhaps a little too informal; at any rate it was considered to contrast unfavourably with what has been termed 'the lofty dignity' of Lord Mansfield. In conveying his ideas he has been charged with the adoption of too colloquial a style and with the greater fault of prolixity; but then, on the other hand, his statements were always luminous, and his prolixity arose from the desire he evinced to satisfy those interested by viewing the question at issue in every conceivable light.

With the surrender of the seals in 1770, Lord Camden's judicial career finally closed; and during the remaining twenty-four years of his life he was entirely a political character. His general parliamentary conduct during the remarkable session of 1770, consisted in a strenuous opposition to the policy of Lord North's administration; and Lord Mansfield was on most occasions his personal antagonist. The doctrine asserted by Lord Mansfield on the trials of Woodfall and Miller, that the jury, in cases of libel, were to decide upon the fact of publication only (a question which was not finally determined until the passing of Mr. Fox's Libel Act in 1792), was warmly reprobated by Lord Camden in the House of Lords; and upon this and upon other occasions he indulged in a degree of personal bitterness towards the chief justice which is variously accounted for by contemporary writers, but which certainly derogates from the dignity and general merit of Lord Camden's character. Lord Camden also uniformly opposed the ill-advised policy of Lord North respecting America; and in 1778 he signed, and is said to have framed the protest of the Lords against the rejection of Lord Rockingham's motion for an address to the king, praying him to disavow the obnoxious manifesto of the American commissioners. On the recall of Lord Rockingham and the Whigs to power in 1782, Lord Camden was appointed president of the council; but was displaced upon the formation of the Coalition-ministry in 1783. To this administration he placed himself in zealous opposition; and in the debate on Mr. Fox's India Bill in the House of Lords, he distinguished himself by an able and eloquent speech against the measure. The fate of this bill put an end to the short existence of the Coalition-ministry; and soon after the formation of Mr. Pitt's administration, Lord Camden was reinstated in the office of president of the council, which he continued to hold during the remainder of his life. Though now upwards of seventy years of age, and though his health was considerably impaired by repeated attacks of gout, he continued his attendance in the House of Lords, and actively assisted in the several debates upon the Indian Judicature Bill, the Wine Excise Bill, and several other important measures which were introduced during the early part of Mr. Pitt's administration; and upon the occasion of the king's derangement in 1788, he introduced the plan proposed by government for the establishment of a regency. In 1786 he was created Earl Camden, and received the additional title of Viscount Bayham, of Bayham Abbey, in the county of Kent. The last occasion upon which he took a part in the debates was upon the discussion of Mr. Fox's celebrated Libel Act, in 1792. The question of the province of juries in cases of libel was one which during the whole of his life had deeply interested him: in his defence of Owen, in 1752, he had warmly asserted the popular doctrine upon this subject; and on the introduction of this bill into the House of Lords he particularly distinguished himself by the animation and eloquence with which, in advanced age, he maintained the principle which in his early years he had often zealously espoused. Lord Camden died April 13th, 1794, in the eightieth year of his age.

CAMDEN, WILLIAM, one of the most illustrious names in the whole catalogue of learned Englishmen. His father was a paper-stainer, living in the Old Bailey, where Camden was born on the 2nd of May, 1551. It is supposed that his father died when he was but a child, leaving little provision for him. It is certain that he was admitted into Christ's Hospital within a very few years after its establishment. He was afterwards in St. Paul's School, and finally removed to Oxford, where he appears to have studied in more than one college. He left the university in 1571, and became an under-master of Westminster School, the duties of which situation he discharged at the time when he composed the works which have made his name so eminent.

The most celebrated of these is that entitled 'Britannia,' a survey of the British isles, written in elegant Latin. The first edition of this work was published in 1586. Many others appeared in his lifetime with enlargements. A singular fate has attended this book. A long succession of writers have made additions to it, till Camden's

'*Britannia*,' which as it came forth from him was but a single volume of no large dimensions, has been swelled out in the successive English editions till at length it has become four folio volumes, though the work is still called by his name. One effect of this has been to throw the original work into the shade, and to excite a wrong apprehension to prevail concerning it, as if it had been composed for the use of the inhabitants of Britain rather than for the information of learned foreigners, and as if it were not that succinct and admirable composition which does so much honour to the taste and judgment as well as to the learning of the author.

The English editions, though the matter is ill-digested, have their value as containing what at the time of publication was the best general description of the British isles. Bishop Gibson and Mr. Gough were the compilers and editors of the principal English editions.

From the appearance of his '*Britannia*,' Camden began to be looked upon as one of the most distinguished scholars of his age. He carried on an extensive correspondence with the learned both at home and abroad, much of which has been preserved and published. The prebend of *Ilwacumbis* in the cathedral of Salisbury was given to him, though a layman. He was made head master of Westminster School in 1592, and Clarencieux King-at-Arms in 1597, without having passed through the inferior offices of herald or pursuivant. This was distasteful to the old officers of the College of Arms, and led to what must have been to him harassing dimensions.

The remainder of his history is to be found in a catalogue of his writings. We shall touch upon them briefly. His '*Annals of the Reign of Elizabeth*' is the next in celebrity to his '*Britannia*,' an admirable digest of the events of that reign, delivered in pure and elegant latinity. He intended a similar work on the reign of James, but of this only the heads were prepared. His folio volume of the works of some of our old Latin chroniclers was printed at Frankfurt in 1603. It belongs to the set of Latin chroniclers on English affairs, and contains *Anser*, *Walsingham*, *Giraldus Cambrensis*, and others. Among his minor works two only need be mentioned, his '*Remains concerning Britain*,' published in 1601, a very amusing and instructive volume; and a small Greek grammar for the use of Westminster School, which was first published in 1597.

Camden reached the age of seventy-two. He died on the 9th of November 1623, at Chislehurst in Kent, and was interred in Westminster Abbey, a great assemblage of the learned and illustrious doing him honour at his funeral. A monument was erected to his memory, which still remains. It has his bust, with the left hand resting on the '*Britannia*.'

He never married, and at his death left a good estate, the greater part of which he devoted, a little before his death, to founding an historical lecture in the University of Oxford, now called the Camden Professorship of History. Camden has always been regarded with peculiar respect by English historical inquirers and antiquaries; and when in 1838 they founded a '*Society for the Publication of early Historical and Literary Remains*,' it was felt that the most appropriate title which could be given to it would be that of their most distinguished predecessor. The '*Camden Society*' has since continued annually to place within the reach of historical students a mass of singularly varied and valuable '*remains concerning Britain*,' and has thus become a worthy monument to the memory of Camden.

CAMERARIUS, JOACHIM, was born at Bamberg in 1500, studied at Leipzig, and became a great friend of Melancthon and other reformers. The Duke of Wurtemberg gave him the direction of the new University of Tübingen. In 1541 he was charged by Henry duke of Saxony with reforming the University of Leipzig, of which he was afterwards appointed rector. In 1560 the Emperor Maximilian, who had called him to Vienna to consult him about some important state-affairs, wished to retain him as his counsellor, but Camerarius declined the offer on account of his infirmities. He died at Leipzig in April, 1574. Camerarius was one of the most distinguished scholars of the age of the Reformation. The following are his principal works:—1. '*Libellus Senniciensis*,' containing maxims and precepts from Pythagoras, Phocylides, Solon, and extracts from Tyrtæus, Simonides, Callimachus, &c. 2. '*Narratio de H. Rebaso Hæmo*,' including biographical notices of several other learned men of the same age. 3. '*Vita Philippi Melancthonis*,' a good biography of that distinguished reformer. 4. '*De rebus Turcicis Commentarii duo*.' 5. '*Historia Synodi Nicenæ*.' 6. '*Novæ sive de Ostentis lib. duo*.' 7. '*Vita Mauricii Saxonie Electoris*.' 8. '*De Divisionum Generibus*.' 9. '*De Numismatibus Græcorum et Latinorum*.' 10. '*Philosophicæ Consolationes*,' written by him and *Sabinus* united. 11. '*Historia Narratio de Fratrum Orthodoxorum Reclutis in Bohemia, Moravia, et Polonia*,' besides numerous translations from and commentaries on *Cicero*, *Aristotle*, *Sophocles*, &c. Camerarius was an excellent horseman, and he wrote a work on the art of training horses, '*Hippocodæus*,' which enjoyed considerable reputation. The '*Epistolæ*,' or correspondence, were published after his death by his son Joachim in two vols., Frankfurt, 1585-85.

John Camerarius, his eldest son, became a councillor of the duchy of Prussia. His second son, Joachim, was a distinguished physician, and has left several works on medicine and botany. His third son, Philip, while travelling in Italy, was arrested by the Inquisition at Rome, but was afterwards released, and on his return to Germany became vice-chancellor of the new University of Altorf. He wrote

'*Horarum subsecivaram Centurie tres*,' 3 vols. 4to, Frankfurt, 1624, a work often reprinted.

CAMERON, REV. RICHARD, founder of the sect of Cameronians, first acquired notice as one of those ministers of the Church of Scotland who most boldly opposed the measures of Charles II. and his advisers for enforcing the Episcopal form of worship on the Scottish people. The arbitrary measures adopted by the government thoroughly roused the spirit of the people, and among those who gave fullest expression to the popular sentiments was Richard Cameron. Not only were his doctrines obnoxious to the government, but many of his brethren of the clergy dreaded his zeal, which they considered extreme, and at a meeting held in Edinburgh in 1677 they formally reprovied him for his conduct. Cameron retired to Holland, but soon returned to Scotland; and on the 22nd of June 1680, in company with about twenty other persons of similar sentiments with himself, well armed, he entered the town of Sanquhar in Dumfriesshire, and at the market-cross there proclaimed, in a ceremonious manner, a declaration, that Charles Stuart (meaning the king), although descended from the race of their ancient kings, had by his perjuries in the breach of his covenanted vows, his tyrannical government, and his usurpation over their civil and religious liberties, dissolved their allegiance and forfeited all right and title to the crown. The party kept together in arms for a month in the mountainous district between Nithdale and Ayrshire; but at length, on the 20th of July, while lying at Airdsmoss in Kyle, they were surprised by a large body of horse and foot under the direction of the government, and in the short skirmish which followed, Cameron was killed, and his followers were dispersed or taken prisoners. A neat monument has been recently placed on the spot where Cameron fell, replacing an old and plainer structure.

Among the more earnest followers of Cameron was Cargill, who continued to preach the doctrines of the sect in the fields; and in September following, at a conventicle held in the Torwood, between Falkirk and Stirling, pronounced a solemn excommunication against the king and his brother the Duke of York, the dukes of Monmouth, Lauderdale, and Rothes, the lord-advocate, and General Sir Thomas Dalzell of Binns, for their exertions against the supremacy of the pure church of Scotland, their perjury in reference to the covenant, and their cruelty and oppression towards the people of God. To these acts of the royalists was soon afterwards added the Test of 1681, against which the covenanters published their testimony at Lanark on the 12th of January 1682, adhering to and confirming the Sanquhar declaration, and giving reasons at length for their disowning the king's authority. This they again did, and declared their firm resolution of constant adherence to the covenant, in their Apologetic Declaration of the 28th of October 1684; and on the accession of James duke of York to the throne, they published another declaration at Sanquhar on the 28th of May 1685, wherein they renewed their previous declarations, and further protested against the accession of the Duke of York, as a professed and excommunicated papist, and against popery itself in all its heads, as abjured by the national covenant. In these circumstances, it is plain the Revolution was an event which they would hail in common with the other Presbyterians, but the latter acquiesced in arrangements with the government into which the former refused to enter; and they have since continued to testify against the Revolution settlement, as they now also do against the Articles of Union, the Toleration Acts, the conduct of the church, and generally, all association whether of church or state with those who do not adopt the principles of Scripture, the Reformation, and the covenant.

They have been most commonly known as Cameronians from Richard Cameron; but they are otherwise called '*M'Millans*,' or '*M'Millanites*,' from the name of the first minister who espoused their cause after the Revolution. But these, as well as the terms '*Whigs*' and '*Mountain men*,' which are also occasionally applied to them, they regard as accidental epithets. They are sometimes also called '*Covenanters*,' from their adherence to the national covenant of Scotland, and the solemn league and covenant of the three kingdoms. Their proper designation however, or that which they themselves adopt, is that of '*Reformed Presbyterians*.'

They hold the Holy Scriptures to be the absolute rule of faith and conduct, and to contain the standard of these both in church and state. Next to this they adopt the early standards of the Church of Scotland, the Westminster Confession of Faith, the larger and shorter catechisms of the church, the books of discipline, and the Westminster Directory for Public Worship. And lastly, they regard the national covenant of Scotland as a continuing obligation. To these are to be added the documents published by the body itself in explanation of their principles, namely, their '*Judicial Act and Testimony*,' the 5th edition of which was published at Glasgow in 1818; '*A short Account of the Old Presbyterian Dissenters*,' published by authority of the presbytery in 1806; and an '*Explanation and Defence of the Terms of Communion adopted by the Reformed Presbyterian Church*.'

The religious body was formed into a presbytery on the 1st of August 1743, under the title of the Reform Presbytery. They have now a synod, consisting of the Edinburgh, Glasgow, Paisley, Kilmarnock, Dumfries, and Newton Stewart presbyteries. The number of churches is 41; their places of worship contain about 15,000 sittings. They have also several churches in Ireland, Nova Scotia, New

Brunswick, and the United States; and they have missionaries in New Zealand and the New Hebrides, and one in London who labours among the Jews.

CAMILLUS, MARCUS FURIUS, a celebrated Roman, who lived about the middle of the 4th century after the foundation of the city. There is so much of the fabulous in all that is told about him that one might very reasonably suppose that Livy and Plutarch have derived the traditions respecting this warrior from some old poem. (Niebuhr, 'H. R.' vol. ii. p. 472.) That there was such a person, and that his actions entitled him to the gratitude of his countrymen, cannot, we think, be doubted, and even Niebuhr has not attempted to deny him the personality which he is unwilling to concede to Romulus and Coriolanus. ('H. R.' ii. p. 501.) Camillus was created dictator five times, and triumphed four times, but never served the office of consul. (Plutarch, 'Camill.' init.) This was principally owing to the substitution of the military tribunate for the consulship in the early part of his life. His first dictatorship was in the tenth year of the siege of Veii, which was taken by him probably by means of a mine, by which part of the wall was overthrown. (Niebuhr, 'H. R.' ii. p. 481, who has sufficiently refuted the ordinary tradition.) He also conquered the Faliscans, who, according to the legend, yielded unconditionally to him in consequence of his generosity in restoring to them their children whom a traitorous schoolmaster had delivered into his hands. (Plutarch, 'Camill.' x.) He was impeached, in A.U.C. 364, by the tribune L. Apuleius, on a charge of peculation in the distribution of the plunder of Veii, and his guilt was so manifest that even his own clients could not acquit him. (Liv. v. 32.) Camillus retired to Ardea, and lived there as an 'inquinus' till the battle of the Allia and the capture of Rome: he then took up arms for his country, and led the Ardeates against the Gauls, over whom he obtained some advantages. At length the people, sensible of the necessity of his recall, restored him to his civic rights by an ordinance of the plebs passed at Veii, and after two battles, the one fought in the city and the other on the road to Gabii, he completely exterminated the invading army. It was probably owing to his influence that the Romans were induced to rebuild their own city in preference to migrating to Veii, as many wished to do, and for this and his other services he was called the second Romulus. In his fourth dictatorship he had some more disputes with the plebeians, in consequence of which he abdicated his office. (Liv. vi. 38.) He died of the plague in the year of Rome 390. (Liv. vii. 1; Plutarch, 'Camill.' xliii.) His son and brother were also eminent men, but with these exceptions no one of his family, according to Tacitus ('Annal.' ii. 52), obtained military renown till the age of Tiberius, when Furius Camillus, proconsul of Africa, triumphed over the Numidians. The son of this Camillus raised a rebellion in Dalmatia in the reign of Claudius, and proclaimed himself emperor, but in a few days his soldiers returned to their allegiance, and Camillus committed suicide.

CAMOENS (Dom Luis de Camões), called the Homer and Virgil of Portugal, for his celebrated poem of the 'Lusiad,' was born at Lisbon; though Coimbra and Santarem have disputed this honour with Lisbon. There is no less controversy about the precise year of his birth, which, according to some, was 1517 while most biographers suppose it to be 1524.

His family was of considerable note, and originally Spanish. In his infancy, his father, Simon Vas de Camoens, commander of a vessel, was shipwrecked at Goa, and lost, with his life, the greater part of his fortune. His mother, however, Anne de Macedo, of Santarem, was enabled to give her son such an education as qualified him for the military service and for public life. Camoens was sent to the university of Coimbra, where, notwithstanding Voltaire's rash assertion that his youth was spent in idleness and ignorance, it appears from his works that he must have acquired the substance as well as caught the spirit of classical learning.

On quitting the university Camoens returned to Lisbon. His prepossessing appearance and great accomplishments, added to his love of poetry and gallantry, which now engrossed all his thoughts, soon made him an object of public notoriety, especially as the charms of Catharina d'Atayada, a lady of honour (dama do pago) at the court, had captivated his heart. This amour with a lady above his rank was the origin of the long series of Camoens' calamities. He experienced the fate of Ovid, with whom he compares himself in his third elegy, written at Santarem, the place of his exile and retirement, where he also began his 'Lusiad.' Camoens soon became tired of an inactive and obscure life. To be at once a hero and a poet was his ambition. He joined, as a volunteer, an expedition which John III. was then fitting out against the Moors of Ceuta, and greatly distinguished himself in several encounters. In a naval engagement with the Moors in the Straits of Gibraltar he was among the foremost to board, and lost his right eye in the conflict. This he relates himself in his *Canto* x., stan. 9.

Hoping to deserve as a soldier that reward which he had failed to obtain as a poet, he returned to Lisbon; but he failed to gain even an honourable competence. Baffled in all his expectations, he determined to leave his native country; and accordingly he embarked in 1553 for India, in search of better prospects, or, at least, an honourable grave for his misfortunes. As the ship left the Tagus he expressed his resolution never to return, in the words of the sepulchral monument of Scipio Africanus,—*"Ingrata patria, non possidebis ossa mea."*

Camoens arrived safely at Goa, in one of the four ships which sailed to India, after seeing the other three perish in a storm. Not being able to find employment at Goa, he immediately joined as a volunteer a Portuguese expedition, which was ready to sail in aid of the King of Cochin against the King of Pimenta. Although a great portion of his countrymen were carried off by the insalubrity of the climate, Camoens returned safe after he had displayed his usual bravery in the conquest of the Alagada Islands. In the following year he accompanied Manuel de Vasconcello in another expedition to the Red Sea, against the Arabian Corsairs. At the island of Ormuz, in the Persian Gulf, where he passed the winter, his imagination gave a poetic colouring to the scenery of that spot, and to the Portuguese achievements in India. He visited also mount Felix, and the adjacent part of Africa, which he so strongly pictures in the 'Lusiad,' and in one of the little pieces in which he laments the absence of his mistress. Unfortunately for him he indulged also in satire, and exposed in his 'Disparates na India,' (Follies in India) some of the government proceedings at Goa. The viceroy immediately banished him to the island of Macao. Soon after he obtained leave to visit the Moluccas, where he collected fresh materials for pictorial poetry; but he could no longer, as the lines beneath his portrait express, "bear in one hand the sword, in the other the pen," and he was glad to accept the very unpoetic post at Macao of 'provedor-mor dos defuntos' (administrator of the effects of deceased persons), by which employment he was rescued from destitution, and even enabled to make some savings. Having received permission from a new viceroy to return to Goa, he was shipwrecked in the passage on the coast of Cambodia. He saved, on a plank, and with great difficulty, only his life and his poems.

Camoens had not long enjoyed repose when a new viceroy, lending a ready ear to his enemies, who accused him of malversation in his office at Macao, threw him into prison. Although he cleared himself of the charges, and loaded his enemies with ignominy, he was still detained for debts which he was unable to satisfy; but a poem, at once witty and affecting, which he addressed to the viceroy at length procured his liberation. Resuming the profession of arms, he accompanied Dom Pedro Barreto to the distant and barbarous settlement of Sofala. A ship bound homeward having touched at this place, his former resolution was shaken, and he determined to return to Europe. Finally, after an absence of nearly sixteen years, Camoens arrived in 1569 at Lisbon, in the most abject poverty, his poems being the only treasure and last hope which he had brought from the rich shores of India. More ill-fated still at the end of his career, he found his native city ravaged by the plague, and during such a calamity poetry could avail him less than ever. King Dom Sebastian was then concerting the plan of his unfortunate expedition to Morocco, and this induced Camoens to dedicate his poem to the youthful monarch. Although the dedication was graciously received, it was only rewarded with a wretched pension, just sufficient to mark but not to relieve the misery of its author.

It appears that Cardinal Henry, who succeeded Sebastian, withdrew that small pension. He patronised only what was called learning by the monks and friars, whose pious forgeries and miracles he highly valued. Cardinal Henry was the persecutor of George Buchanan, and the patron of the inquisition, of which he extended the horrors even to Goa. Under his weak and bigotted hands the kingdom fell into utter ruin.

The fate of Camoens throws great light on the history of his country, and appears strictly connected with it. The same ignorance and the same degenerate spirit which would have suffered Camoens to starve, but for the sympathy of an aged Indian servant—who begged for him in the streets of Lisbon—and which left him at last to die most wretchedly in an hospital, sank Portugal into the most abject vassalage ever experienced by a conquered nation. While the grandees of Portugal were blind to the ruin which impended over them, Camoens beheld it with a pungency of grief which appears to have hastened his end, in 1579, the year after the fatal issue of the African expedition under King Sebastian, at the battle of Alcaçar.

Camoens attempted every style of poetic composition of which he had formed a definite idea, but the 'Lusiad' rises so far above his other works, that all his numerous but lesser compositions must be considered as inferior scions sprung from the same root. The 'Lusiad' is an heroic poem which differs from all others of the epic class. Camoens struck out a new path in the region of epic poetry.

His object was to recount in epic strains the achievements of the great men of Portugal in general, not of any individual in particular, and, consequently, not of Vasco de Gama alone, who is commonly considered the hero of the 'Lusiad.' The very title he gave it, 'Os Lusíadas' (the Lusitanians), denotes at once the true nature of its subject. An epic grouping of all the great and most interesting events in the Portuguese annals forms the whole plan, and the discovery of the passage to India is the groundwork of the epic unity of the poem, but Vasco de Gama is merely the spindle round which the thread of the narrative is wound. The 'Lusiad' has no real episode except the short story of the giant Adamastor. Unless the idea of the plan of the 'Lusiad' be rightly seized, the composition will appear in a false light on whichever side it is viewed. Designated as a whole, it may therefore be termed an epic national picture of Portuguese glory, greater however than a mere gallery of poetic stories, but less than a

perfect copy. The unity of interest and effect, and consequently of the poem, made mainly on the execution of the plan, out of which only a part of Camoens could have created a 'Lusiad.'

The talent in picturesque comparison was formed on the model of Ariosto more than that of Homer. His description of Venus, who came from intercalaries with Jupiter, resembles Ariosto's description of Adonis. The first idea of his Island of Love seems borrowed from the same writer. There is however little room to doubt that Tasso, when he tried in Ariosto's footsteps in order to describe the abode of Armida, availed himself of the description of Camoens (the 'Lusiad' was first printed in 1572, the 'Jerusalem Delivered' did not appear till 1591, as afterwards the garden of Armida furnished Spenser with his 'Bower of Bliss').

Camoens has left, besides the 'Lusiad,' specimens of no common merit in every style of poetry written in Portugal in his time; 801 of his sonnets which have been preserved, exhibit his prolific fancy, and some of them all the tenderness and grace of Petrarch. His seventeen 'Canções' (songs) prove still more particularly how deeply he was penetrated with the spirit of Petrarch's poetry. The twelve odes which follow approximate more nearly to the classical style, and the first addressed to the moon, begins in the pure ode style, and is particularly distinguished for its beauty. In his 'Sextinas' Camoens has not failed in rendering their artificial ornaments pleasing. But his twenty-one elegies are more worthy of attention; they are in general the longest poems of the collection next to the 'Lusiad' and the 'Cantata.' Some were written in his youth and in exile, others during his oriental voyages and adventures. No other works of the poet so irresistibly command the reader's regret for his misfortunes, and regard for him as a man.

A few poems widely differing from each other, are printed under the common title of 'Estancias' (stanzas), because they are all composed in Italian octaves. The first three of the series are all truly poetic epistles, and faithful mirrors of the character and principles of the author.

Among the miscellaneous poems of Camoens the 'Elogues' occupy a considerable space. They have more the form than the spirit of pastoral poetry. Passages in Spanish are occasionally interspersed with the Portuguese.

In the collected works of Camoens a separation is made of his poems in the Italian style and the Italian syllabic measure from those which are composed in 'quintilhas.' In this style also he has enriched every species of poetic composition then known in Portugal and Spain. The 'redondilhas' on his return from Macao to Goa, after he had narrowly escaped death by shipwreck, are among those best known.

Romantic, gallant, and comic effusions of fancy and wit ('glossas' in the Spanish style, 'voltes' in Portuguese), and other poetic trifles in the Portuguese and Spanish languages, appear to have been dealt out at every opportunity with a profuse hand by Camoens, and no mental effort seems to have been too homely for him.

Finally, to leave no kind of poetical composition unattempted, he wrote (probably previous to his departure for India) three dramas: 'El Rey Seleuco' (King Seleucus); 'Os Amphitryões' (The Amphitryons); and 'Fidélitas.' Had the genius which animates the 'Lusiad' taken a dramatic direction, Camoens would have been the Calderon of Portugal before a Lope de Vega had arisen in Spain.

A very good edition of the works of Camoens appeared at Lisbon in 1779-80, under the title of 'Obras de Camoens, Principe dos Poetas de Hespanha,' 4 tom. 12mo. A second edition also appeared in 1782-83, in five small volumes, the first of which contains the life of the author and the 'Lusiad,' and the last the dramatic and other pieces ascribed to Camoens. A very accurate and splendid edition of the 'Lusiad' was published, with very fine engravings, in one vol. 4to, by Firmin Didot at Paris in 1817, the expense of which was defrayed by Souza Bello. Of this edition very few copies were printed, and it is now consequently rare. The 'Lusiad' has since been several times reprinted. Of the English translations, Mickie's, with all its faults, perhaps best preserves the characteristics of Camoens's style.

CAMPAN, MADAME, was the daughter of M. Genet, an officer in the foreign department under Louis XV. She was born in October 1752. At fifteen years of age she was appointed reader to the princesses, daughters of Louis XV. In 1770 she married M. Campan, and was soon after appointed first lady of the bedchamber to Marie Antoinette, then dauphine. She remained with Marie Antoinette during her husband's reign, and was with her in the first scenes of the Revolution, up to the storming of the Tuilleries on the 10th of August, when she narrowly escaped with her life. Being forbidden to follow her mistress to her prison in the Temple, she retired into the country, and at last opened a boarding-school at St. Germain-en-Laye. The establishment prospered, and was patronised by Josephine Beauharnais, who sent her daughter Hortense to it. In 1806, when Napoleon formed the establishment at Ecouen for the daughters and sisters of the officers of the Legion of Honour, he appointed Madame Campan to superintend it. After the Restoration, the school of Ecouen being suppressed, Madame Campan retired to Mantes, where she died in March 1822, leaving behind her a character for mild virtues and considerable information and accomplishments. She has written—'Mémoires sur la Vie privée de Marie Antoinette, Reine de France, suivis de Souvenirs et Anecdotes Historiques sur les Règnes de

Louis XV. et Louis XVI.,' translated into English in 1823. She gives a faithful and impartial account of Marie Antoinette. Her recollections of the old court of Louis XV. are also curious.

CAMPANELLA, TOMMASO, born near the town of Stilo in Calabria, in 1568, entered the Dominican order and became distinguished for his learning. He applied himself chiefly to metaphysics, and followed his countryman Telesio, who died in 1588 at Cosenza, in his opposition to what was then taught in the schools under the name of Aristotelian philosophy. Campanella published his first work at Naples, in 1591, entitled 'Philosophia Sensibus demonstrata adversus eos qui proprio arbitratu, non autem sensata duce natura, philosophati sunt, cum vera Defensione Bernardi Telesii.' Philosophy was at that time a very dangerous ground for discussion, as was experienced, among others, by Bruno and Vanini, both natives of the kingdom of Naples, who were burnt alive for their opinions, one at Rome and the other in France. [BRUNO, GIORDANO.] The schoolmen, and the monks especially, raised such a storm against Campanella that he left his native country. He was accused of sorcery, of being an adept of Raymond Lullus, and of some cabalistic Rabbins. Campanella went to Tuscany, where the grand duke Ferdinand de' Medici received him with great kindness, and offered him a professorship at Pisa, which he declined; thence Campanella proceeded to Padua, where he gave private instruction to several young patricians of Venice. About this period he wrote several works, among others a project of a Christian monarchy, with a treatise on Church government, addressed to the pope, in which he suggested how, with mere spiritual weapons, he might bring all Christians within the pale of the Church. Campanella appears in this and other of his works as an admirer of unity, both in Church and State; he advocated a universal spiritual monarchy as well as a temporal one, both acting in unison for a common purpose. After some years, Campanella left Padua for Rome, but his papers were seized on the road, and it seems that they found their way to the archives of the Inquisition at Rome; but the author remained unmolested for the present. From Rome, Campanella returned to his native country, where he lived for some time at Stilo, enjoying considerable celebrity for his learning, until serious political events came to disturb the land. A vast conspiracy is stated to have been hatched in Calabria; in which several hundred monks and other clergymen, some bishops, and many barons were said to be implicated, against the Spanish vice-regal government, which was one of the worst in Europe. The peasantry were ripe for revolt, being ground down by taxes, and still more by the cruel manner in which they were levied. Philip II. of Spain, who had wielded so long with a strong hand the power of the Spanish crown, was dead, and his successor had not inherited his abilities or his firmness. The Count de Lemos was sent viceroy to Naples by Philip III., and a fresh tax on 'fuochi' (hearths), or families, was imposed. Disatisfaction became loud all over the country. In August 1599, two citizens of Catanzaro revealed the plan of a conspiracy, in which Campanella and his brother friar, Dionisio Ponzio di Nicastro, were leaders. It was said that their object was to proclaim a republic, and that they relied upon the Turks for assistance; and had carried on a correspondence with Cicala Pasha, a Turkish admiral, but himself a Calabrian renegade, who was then scouring the neighbouring sea with his squadron. Such a plan may have been conceived by some person; but that a man of so much information and judgment as Campanella displays in his works, a monk, and an advocate for a universal Christian monarchy, could think of establishing a republic in Calabria by means of Turkish assistance and against the power of the Spanish monarchy, is incredible, and the sequel tends to disprove the charge. Campanella and Dionisio Ponzio were arrested, together with many more, and sent to Naples, where several of the conspirators, having confessed under torture, were executed. Campanella remained in a dungeon for years: he was put to the torture seven times; five times his trial was begun afresh, but he confessed nothing, or had nothing to confess, and after several years his confinement was mitigated, and he was allowed to see his friends. Charges of heresy were mixed up with political charges against him; he was even accused of being the author of the book 'De Tribus Impostoribus,' which Campanella observes had been published thirty years before he was born. The historian Giannone asserts that Campanella was really a leader of the great conspiracy, which he says was concocted chiefly by monks; but Giannone, like most Neapolitan jurists, was prejudiced against monks and churchmen in general, and he believed the insinuations of the viceregal lawyers. Botta, in his continuation to Guicciardini, has followed Giannone implicitly. A search was made a few years back in the archives of Naples for the papers relative to Campanella's imprisonment and trial, but nothing was found. Most of the documents existing of the viceregal judicial administration are of a later date than Campanella's trial; the previous records of the 16th and beginning of the 17th centuries are missing. Antonio Serra, a Calabrian, and one of the earliest writers on political economy, was one of the individuals imprisoned on the same occasion as Campanella, and he also was tortured and kept in prison for years. Campanella enjoyed at one time a glimpse of favour from the viceroy Duke of Osuna, who loved to converse with him on politics; but when Osuna was recalled and arrested, on the charge of having intended to assume supreme power at Naples, Campanella became the object of fresh suspicions, and his

captivity was made more rigorous. At last, in 1626, he was released from his prison at the pressing request of Pope Urban VIII., who, probably in order to obtain his release, urged that as the prisoner had been charged with heresy, and was moreover an ecclesiastic, he ought to appear before the tribunal of the Inquisition. Campanella was therefore sent to Rome, and lodged in the buildings of the Holy Office, where however he was a prisoner at large, and was treated with considerable attention. After three years more, making in all thirty years of confinement, he was allowed his full freedom. He remained for several years at Rome, enjoying the favour of the pope, of many of the cardinals, and other distinguished persons. He published two works in favour of the Papal See and Court:—*'Monarchia Messias, ubi, per philosophiam divinam et humanam demonstrantur Jura summi Pontificis super universum Orbem,'* Jesi, in the Papal State, 1633; and *'Discorsi della Libertà e della Felice Suggerzione allo Stato Ecclesiastico,'* Ibid. The object of the last work was to show that the people subject to the Papal See were among the happiest in Italy, which was then perhaps true. These two works having occasioned remonstrances and complaints on the part of the Spanish and other courts were suppressed, and copies of them are very scarce. He also wrote at Rome a *'Liber de Titulis,'* on hierarchical precedence and titles of honour.

Campanella had become very intimate at Rome with the Duke de Noailles, ambassador of Louis XIII., and this intimacy, added to the old suspicions of the agents of Spain, made them cry aloud against the protection granted by the pope to a turbulent friar, whom they compared to Luther. Campanella stood evidently in danger, even in the midst of Rome; so great was then the dread of the Spanish power in Italy, that the pope's protection was deemed insufficient. Noailles proposed to Campanella to take refuge in France, and he sent him off in his own carriage, disguised as one of his attendants, and with letters of recommendation to the minister Cardinal Richelieu. Campanella arrived safely at Marseille, in October, 1634; he saw at Aix the learned Peiresc, who treated him most kindly and provided him with necessities for the remainder of his journey. At Paris he had a very favourable reception from Richelieu, who conversed with him confidentially on the affairs of Italy, and introduced him to Louis XIII., who granted him a pension. Campanella, worn out by his sufferings, retired to the convent of his order, the afterwards famous Convent of the Jacobins in the Rue St. Honoré, where he died, in 1639.

The works of Campanella are very numerous. The Dominican bibliographers Echart and Quetif, *'Scriptor. Ord. Prædic.''* give a long catalogue of his inedited works. Among those that have been published, the following are deserving of notice:—*'Prodrum Philosophiæ Instaurandæ, seu de Natura Rerum, cum Præfatione ad Philosophos Germanos,'* Frankfurt, 1617. The preface is by Tobias Adami, a learned German, who became acquainted with Campanella in his confinement at Naples. Campanella entrusted him with several of his manuscripts. *'De Sensu Rerum et Magia Libri IV., ubi demonstratur Mundum esse Dei vivam statum beneque cognoscendum; omnes illius partes sensu donatas esse, quatenus ipsarum conservationi sufficit; et fere omnium naturæ arcanorum reperiuntur rationes,'* Frankfurt, 1620. This work was composed, as well as several others, by Campanella during his Neapolitan captivity, and was published in Germany by Adami, but the author published a second edition of it at Paris in 1636, which he dedicated to Cardinal Richelieu. Father Mersenne wrote to refute the book as heretical, and Athanasius of Constantinople wrote against it in his *'Anti-Campanella,'* Paris, 1655. *'Realis Philosophiæ Epilogotice Partes IV., cum Tobie Adami Annotationibus; accedit Appendix politicus sub hoc Titulo: Civitas Solis, seu Idea Reipublicæ Philosophicæ,'* Frankfurt, 1620. The *'Civitas Solis'* has been often reprinted separately, and translated into various languages. *'Apologia pro Galileo, ubi disquiritur utrum ratio philosophandi quam Galileus celebrat faveat Scripturis sacris an adversetur,'* Frankfurt, 1662. *'De Prædestinatione, Electione, Reprobatione, et auxiliis Divinæ Gratiæ, Cento Thomisticæ,'* Paris, 1636. The author discusses some of the opinions of Thomas Aquinas, and supports those of Origenes. *'Universalis Philosophiæ, seu Metaphysicarum Rerum Libri XVIII.,'* Paris, 1638. *'Philosophiæ Rationalis Partes Quinquæ,'* *'De Gentilismo non retinendo Quæstio unica,'* Paris, 1638. The question proposed in, whether it is lawful to contradict Aristotle. The following works of Campanella were published after the death of the author. *'De Libris propriis et recta Ratione Studendi,'* Paris, 1642, in which the author speaks of himself, his studies, and his works. It was edited by Naudé, who knew Campanella, and who speaks of him and his imprisonment in his *'Considérations Politiques sur les Coups d'Etat,'* *'De Monarchia Hispanica Discursus,'* Amsterdam, 1640. This, perhaps the most remarkable work of Campanella, was written by him during his confinement at Naples. It is an able sketch of the political world of that time, and with reference to the Spanish monarchy, which was then the preponderating power, it showed how that preponderance could be maintained and increased. This work made a great noise at the time; it was reprinted several times, and was translated into English (chiefly no doubt in consequence of the plan which Campanella suggests to the Spanish monarch for obtaining possession of England on the death of Elizabeth), and published during Cromwell's Protectorate: *'A Discourse touching the Spanish Monarchy, wherein we have a political glass representing each particular country,*

province, kingdom, and empire of the world, with ways of government by which they are kept in obedience, written by Thomas Campanella, and newly translated into English according to the third edition of his book in Latin,' London, 1654, with a preface by the translator, giving a notice of Campanella's adventures. The work was reprinted after the Restoration, under this title: *'Thomas Campanella, an Italian Friar, and second Machiavel, his Advice to the King of Spain for attaining the Universal Monarchy of the World, particularly concerning England, Scotland, and Ireland, how to raise division between King and Parliament, to alter the government from a Kingdom to a Commonwealth, also for reducing Holland and other seafaring countries, &c., with a preface by William Prynne of Lincoln's Inn.'*

In the King's Library at Paris are several manuscripts of Campanella, among others an invective against the Jesuits, and a discourse against the Lutherans and Calvinists. In the Imperial Library at Vienna there is an Italian dialogue of Campanella, on the means of convincing of error all the heretics and sectarians of his time. Some short Italian poems of Campanella were published a few years back at Lugano, by Orelli. Adami published some of his Latin poems.

(Baldacchini, *Vita e Filosofia di T. Campanella*, Naples, 1840, with several inedited letters of Campanella; Tiraboschi, *Storia della Letteratura Italiana*, &c.)

CAMPANI, MATTHEW and JOSEPH, two brothers, natives of the diocese of Spoleto, were alive in and after 1678. They are sometimes confounded, as for instance by Weidler. Matthew, the elder, was curate of a parish at Rome, and applied himself to watchmaking and optics. He is mentioned as having constructed a clock which was illuminated by night from the interior, and he published a work on the subject of clockmaking in 1678. But he is principally known as having been the first who ground object-glasses of enormous focal length. By order of Louis XIV. he made one of a focal length of 130, one of 150, and one of 205 palms (9½ inches French, according to Auzout); and with one of these Dominic Cassini first saw the satellites of Saturn. His smaller glasses were much esteemed. Weidler says (of Joseph Campani, but we suspect it must be Matthew who is meant), on the authority of the *'Journal des Savans,'* 1665, p. 4, that he endeavoured to destroy chromatic aberration by means of a triple eye-glass. There is a paper of his in *'Gaudentii Roberti Misc. Ital. Phys. Math.,'* Bologna, 1692.

Joseph Campani was also an astronomer, and made his own telescopes. He published various observations (see Lalande, *'Bibl. Astron.,'*) and is the one referred to in Auzout.

CAMPANUS, JOHN, of Novara in the Milanese, the first translator of Euclid from the Arabic. Blancanus (*'Chron. Math.,'*) places him between A.D. 1000 and 1100, but says that by his own account he wrote a calendar in the year 1200. Vossius confirms the latter, and cites the calendar in question, and also Blancanus in confirmation, without noticing the discrepancy. Riccioli contends for A.D. 1030. There is no doubt the writer of the calendar lived about A.D. 1200, but whether an earlier Campanus might not have been the translator of Euclid is a question. Tiraboschi (cited by Montucla) has shown that there was a Campanus who was chaplain to Pope Urban IV. (elected 1261), but we do not see on what grounds Tiraboschi positively affirms this one to have been the translator of Euclid.

This translation was the first printed, and we shall give an account of this early triumph of the art. There is no title-page; the first words being *'Preclarissimus liber elementorum Euclidis perspicacissimi: in artem Geometriæ incipit quæ foelicissimum: punctus est cuius pa nō est,'* &c. At the end we find *'¶ Opus elementorū euclidis megarensis in geometriæ artē In id quoq; Campani perspicacissimi Comēntationes finit. Erhardus ratdolt Augustensis impressor solertissimus. venetis impressit. Anno salutis. M.cccc.lxxxij. Octavis. Calēn. Jūn. Lector. Vale.'*

There is a preface by Ratdolt, in which he complains that, among the vast number of books then printed at Venice, there should be so few on mathematics. This he attributes to the difficulty of representing diagrams, and states that he has discovered a method of printing them as easily as letter types. This appears to be wood-cutting; and the diagrams are on a broad margin by the side of the black letter.

The translation itself is evidently from the Arabic, not from the Greek. Several Arabic terms are introduced; an equilateral rhombus is called *'helmuaumy'*; a parallelogram, *'similis helmuaumy'* in the definitions, but afterwards a *'parallelogram'*; a trapezium is *'helmua-riphe.'* There was a reprint at Venice in 1491, not by Ratdolt; and the commentary of Campanus was reprinted by Henry Stephens at Paris in 1516 in the edition of Zamberti. Billingsley's English translation, best known by John Dee's preface, was made from Campanus.

For a copious list of manuscripts of Campanus in different libraries, &c., see Heilbrunner, *'Hist. Math. Univ.,'* (Index.)

CAMPBELL, LORDS OF ARGYLL. [ARGYLL, CAMPBELL, LORDS OF.]

CAMPBELL, LORD. John Campbell, now Lord Campbell, and Chief Justice of the Court of Queen's Bench, was born in 1779 at Springfield, near Cupar, Fifeshire, in Scotland. He is the second son of the Rev. Dr. George Campbell, minister of Cupar, Fifeshire. He was educated at the University of St. Andrews. In November 1800 he was entered as a student at Lincoln's Inn, London, was called to

the bar in 1806, and became a bench in 1827. In 1830 he was elected M.P. for Stafford, in 1833 for Dudley, and in 1836 for Edinburgh, which city he continued to represent till 1841. He was solicitor-general from 1832 to February 1834, when he was appointed attorney-general, and so continued till November in the same year. In April 1835 he was again appointed attorney-general, and he held the office till June 1841, when he was appointed Lord Chancellor of Ireland, and was raised to the peerage as Baron Campbell. He resigned the chancellorship of Ireland in September 1841. In July 1846 he was made Chancellor of the Duchy of Lancaster, and in 1850 became Chief Justice of the Court of Queen's Bench, with a salary of 8000*l.*, which high office he still fills.

Lord Campbell married in 1821 the eldest daughter of the first Lord Abinger, and his wife in 1830 was created Baroness Stratheden. His son, the Hon. William Frederick Campbell, is heir to the title of Lord Campbell, and to the barony of Stratheden.

Lord Campbell published in 1846 'The Lives of the Lord Chancellors and Keepers of the Great Seal of England, from the Earliest Times to the Reign of King George IV.' The first series is in 3 vols. 8vo, and extends to the Revolution of 1688; vols. 4 and 5, forming the second series, were published in December 1846; and vols. 6 and 7, forming the third series, and completing the work, came out in December 1847. In 1849 Lord Campbell published 'The Lives of the Chief Justices of England, from the Norman Conquest to the Death of Lord Mansfield,' 2 vols. 8vo.

CAMPBELL, SIR COLIN, was born in the city of Glasgow. He entered the army in 1808; and served in the Peninsular War till its termination in 1814. He was in the battle of Vimiera, was engaged in the defence of Torres; was twice wounded at the sieges of San Sebastian; and was also wounded at the passage of the Bidassoa. In 1814-15 he served in America. In 1842 he was engaged in the Chinese War, where he commanded the 98th foot. From 1848 to 1852 he was in Hindostan, and for his conduct there he received the thanks of the East India Company and the British parliament, and received the order of K.C.B. He was appointed brigadier-general of the forces sent in aid of Turkey in 1854, and in the same year was made colonel of the 66th regiment of foot, and a major-general. In 1855 he received the local rank of lieutenant-general in Turkey, and was created a knight grand cross of the order of the Bath. He distinguished himself at the battle of the Alma, when leading the Highland brigade to the assault of the Russian batteries, and again at the battle of Balaklava, when he ranged the 93rd Highlanders in single file, 'the thin red line,' as it has been since called, and thus repulsed the attack of the Russian cavalry.

CAMPBELL, GEORGE, D.D., was born at Aberdeen in 1709. He received a careful education with a view to follow the profession of the law, but he relinquished his legal pursuits for the study of divinity. He obtained a pastoral charge in 1741, and in 1759 was appointed Principal of Marischal College, Aberdeen. In 1763 he published his 'Dissertation on Miracles,' in reply to Hume's work on the same subject. It was translated into French and Dutch, and sold extensively. The degree of D.D. was soon afterwards conferred upon him by King's College, Aberdeen. In 1771 Dr. Campbell was appointed Professor of Divinity. In 1776 he published his most valuable work, the 'Philosophy of Rhetoric,' a work less generally read than that of Blair, but of much greater excellence in every respect. Indeed until the publication of Whately's 'Rhetoric' it was by far the most useful work of the kind in the English language, and few students would even now turn over its pages without advantage. His last work was a 'Translation of the Gospels, with Preliminary Dissertations and Notes,' in 2 vols. 4to. His writings have been frequently reprinted. An edition of Dr. Campbell's works was published by Messrs. Tegg in 6 vols. 8vo. He died in 1796, having resigned his professorship some years previously, on which occasion the king granted him a pension of 300*l.* a year.

CAMPBELL, JOHN, LL.D., a writer on biography, history, politics, and statistics, was born at Edinburgh, March 8, 1708. It is said that his mother prided herself on being a descendant of the poet Waller. At the age of five years he left Scotland, and never after visited it. He was placed in an attorney's office, but relinquished the law for a literary career. Before his thirtieth year he published (in 1736) 'The Military History of Prince Eugene and the Duke of Marlborough,' in 2 vols. folio. He was next engaged as one of the writers in the 'Universal Ancient History.' In 1739 he published the 'Travels and Adventures of Edward Brown, Esq.' 8vo; in the same year 'Memoirs of the Russian Duke de Ripperda,' 8vo; in 1741 a 'Concise History of Spanish America,' 8vo; in 1742 'A Letter on the Discovery, Importance, and Utility of the Thurlow State Papers,' in the same year the first and second volumes of the 'Lives of the English Admirals and other eminent British Seamen,' which work was completed by the appearance of two other volumes in 1744. This work, he says in a letter to one of his friends, cost him a great deal of trouble, and he endeavoured to be strictly impartial. Three editions were published in his lifetime, and a fourth edition was published by Dr. Berkenhout. Shortly after the first appearance of this work it was translated into German. In 1744 he published in 2 vols. folio a collection of 'Voyages and Travels' on an improved plan. In 1745 he commenced his labours in the 'Biographia Britannica,' to which work his contributions were very numerous. He wrote the 'Introduction to Chronology,' and the

'Discourse on Trade' in Doddsley's 'Preceptor.' In 1750 he published a work 'On the Present State of Europe.' His most important work was published in 1774 in 2 vols. royal 4to, and is entitled 'A Political Survey of Britain, being a series of Reflections on the Situation, Lands, Inhabitants, Revenues, Colonies, and Commerce of this Island,' with many practical suggestions for improvements. In 1754 the degree of LL.D. was conferred upon him by the Glasgow University, and in 1774 the Empress of Russia presented him with her picture. Dr. Campbell married in 1736, and died on December 28, 1775. In 1765 he was appointed by the government his majesty's agent for the province of Canada, which office he retained until his death. Dr. Campbell was a man of considerable attainments, and had a fair knowledge of ancient, modern, and oriental languages.

CAMPBELL, REV. JOHN, was born at Edinburgh in March 1766, and apprenticed to a goldsmith and jeweller in his native city. About 1789, at which time he was actively engaged in measures for the extension of Sunday-schools and itinerant preaching in the neglected districts near Edinburgh, he began to prepare himself for the Christian ministry. He subsequently visited London, to take charge of twenty-four young natives of Africa, who were brought from Sierra Leone to be instructed in Christianity, with a view to its introduction into their native land; and in 1804 he became pastor of the Independent Church in Kingsland, a charge which he retained until his death, which took place on the 4th of April, 1840, at the age of seventy-four. Mr. Campbell took an active part in the formation of the British and Foreign Bible Society, and several other important religious associations. In 1812 he made a journey to the stations of the London Missionary Society in South Africa, from which he returned in 1814. Of this journey he in 1815 published an account in an octavo volume. In 1818-21 he revisited Africa, and found some interesting changes produced by the civilisation introduced by the missionaries. The journal of his second visit appeared in 1822, in two octavo volumes. Mr. Campbell published numerous works, chiefly for the instruction of youth, and he was the founder and for eighteen years the editor of the 'Youth's Magazine,' a religious periodical of great utility. In 1823 he established a penny monthly periodical entitled the 'Teacher's Offering,' the publication of which is still continued by the Religious Tract Society. He also prepared an abridgment of his 'Travels in South Africa,' and wrote several religious works for the young.

CAMPBELL, THOMAS, was born July 27, 1777, at Glasgow, where his father, who was the youngest son of a Highland laird, Campbell of Kernan, and had then attained the age of sixty-seven, had spent his life as a merchant, but was now out of business. Thomas was the youngest of a family of eleven sons and daughters. At the university of his native city, where he was educated, he appears to have distinguished himself rather by his occasional exercises, especially in Greek, than by his general industry and proficiency. It is related that a translation (into verse, we suppose) of the 'Clouds' of Aristophanes, for which he obtained a prize in the Greek class, was pronounced by the professor, the late learned and eccentric Professor Young, to be the best exercise ever given in by any student of the university. After leaving the university he resided a short time at Edinburgh, where he published in April 1799 his 'Pleasures of Hope.' Few first poems have ever made so great a sensation, and it still continues to be the poem by which Campbell is best known; indeed he never after ventured on a work of equal extent or pretension. Yet with all its imposing declamatory splendour, and the poetic glow which animates it, it betrays, both in execution and in substance, the raw and unknit mind of youth. It was a poem of extraordinary promise however for a first production. It could not indeed be considered as a mere clever imitation of any reigning model or other previous poetry; taken all in all, in its faults as well as in its beauties, its manner and spirit were its own. It is said that the profits he derived from the sale of the 'Pleasures of Hope' enabled Campbell to visit the continent, which he did in the latter part of the year 1800. He saw part of Germany, and having proceeded to Bavaria, then the seat of war, had a view from a safe distance of the battle of Hohenlinden, fought in December of that year. He was stopped in attempting to pass into Italy, and returned to England by way of Hamburg. A seventh edition of his 'Pleasures of Hope' appeared in 1802, 'with other poems,' among which were his noble verses on the battle of Hohenlinden; his spirited and stirring song, 'Ye Mariners of England,' written at Hamburg on the prospect of war with Denmark; his 'Exile of Erin,' also written there; and his 'Lochiel's Warning,' which had been written at Edinburgh since his return. After being nearly two years in Edinburgh, he removed to London in 1803; and having in the autumn of that year married his cousin, Miss Matilda Sinclair, he appears to have commenced in earnest the pursuit of literature as a profession. Among the works which he produced in the course of the next five or six years, was a compilation, published anonymously at Edinburgh in 1807, in 3 vols. 8vo, entitled 'Annals of Great Britain, from the Accession of George III. to the Peace of Amiens.' He also contributed several articles to the 'Edinburgh Encyclopedia,' begun in 1808, under the superintendence of Dr. (now Sir David) Brewster. Meanwhile in 1806 he had received from the Fox ministry a pension of 200*l.* a year, which he enjoyed while he lived.

With the exception of a few occasional short pieces, he published no more poetry till his 'Gertrude of Wyoming' appeared in 1809, accom-

panied in the first edition by 'Lord Ullin's Daughter' and his 'Battle of the Baltic,' perhaps his finest lyric; and in a subsequent edition by his beautiful and passionate tale of 'O'Connor's Child,' 'Gertrude of Wyoming' is written upon the whole in a much purer style than the 'Pleasures of Hope'—though still not without occasional forms of expression having more sound than sense, such for example as the 'transport and security entwined' which Byron has ridiculed. With all his truth and delicacy of taste in the matter of diction, Campbell seldom altogether escapes these hollow conventionalities of phraseology, at least in his quieter passages. The best executed portions of his 'Gertrude of Wyoming,' as of all his poems, are those in which he is carried along by passion, and has less time to waste on words.

In 1812 Campbell gave six lectures on poetry at the Royal Institution, which attracted large audiences. For several years he published nothing except a few occasional short pieces. In 1818 he made a second visit to Germany, and after his return in the following year his 'Specimens of the British Poets' appeared in 7 volumes, 8vo. (reprinted in 1841, in one volume, 8vo, with additional notes by Mr. P. Cunningham). The 'Essay on English Poetry' by which this work is introduced is written in many passages with great beauty and eloquence. In 1820 Campbell delivered a course of lectures on English Poetry at the Surrey Institution. In 1820 also he undertook the editorship of the 'New Monthly Magazine,' which he retained till 1830. In 1824 he published his 'Theodoric, a domestic tale; it wants the force and fire of some of his other poetry, but is perhaps the sweetest of all his poems. He never wrote anything more touching than the letter of Constance towards the close of this poem. It was however received by the public with great coldness, very much to the annoyance of the author. For some years after this he was much occupied by the interest he took in the emancipation of Greece and of Poland, and also in the project of the London University, now University College, which he always claimed the credit of originating, but the successful carrying out of the idea was certainly due to others.

In 1827 he was elected Rector of the University of Glasgow, and he was re-elected to the office in the two following years. He lost his wife in 1828. Of two sons, one died in infancy; the other survived his father, but was early found to be the subject of mental derangement. In 1831 Campbell established the 'Metropolitan Magazine' upon relinquishing or losing the editorship of the 'New Monthly,' but retained its management in his own hands only for a short time; and in 1832 he paid a visit to Algiers, an account of which he published in the 'Metropolitan Magazine' in a series of papers, afterwards, in 1837, collected and reprinted in two volumes, 8vo, under the title of 'Letters from the South.' The other publications of his last years, none of which brought him much reputation, were a 'Life of Mrs. Siddons,' 2 vols. 8vo, 1834; a 'Life of Petrarch,' 2 vols. 8vo, 1841; 'Life and Times of Frederick the Great' (of this he professed to be only the editor), 4 vols. 8vo, 1841, and 1843; and the 'Pilgrim of Glencoe,' a poem, 8vo, 1842. In the summer of 1843 his health and circumstances being both much impaired, he retired, accompanied by a niece, to Boulogne; and he died there on the 15th of June 1844. His body was brought over to England, and interred on the 3rd of July in Westminster Abbey, near the centre of Poet's Corner, close to the tomb of Addison, where a marble statue of him by Marshall has since been placed.

(Beattie, *Life and Letters of Thomas Campbell*.)

CAMPER, PETER, a physician and anatomist, was born at Leyden on the 11th of May 1722. His father, Florent Camper, was a clergyman, who numbered among his friends Boerhaave, 'sGravesande, Muschenbroeck, and Moor; and in the society of these celebrated men Camper imbibed his strong love of science and the fine arts. He was instructed in drawing by Moor, and in geometry by Labordes. On entering the university of Leyden he devoted himself to the study of medicine, under Gaubius, Van Rooyen, the elder Albinus, and Tricou, under whom he soon rose to distinction; and when he took his degree of doctor in philosophy and medicine in 1746, he published two dissertations,—the one 'De Visu,' the other 'De Oculi quibusdam partibus,' which have been much praised by Baldinger. In 1748 he visited London, where he spent nearly twelve months, associating with Mead, Pringle, and Pott; and where his taste for natural history was awakened by the cabinets of Sir Hans Sloane and Collinson, and the collections of Hill and Catesby. He subsequently successively occupied the chairs of philosophy, anatomy, surgery, and medicine in the universities of Franeker, Amsterdam, and Groningen. When entering upon these professorships he delivered introductory lectures, which were remarkable for the comprehensive knowledge which they evinced in physics, medicine, and anatomy, as well as for an uncommon talent of observation. He obtained a prize from the Academy of Sciences in 1772, and an *accessit* in 1776; a prize from the Academy of Dijon in 1779; from that of Lyon in 1773, and that of Toulouse in 1774; and from the societies of Haarlem and Edinburgh, and the academy of surgery. He was a member of the Academies of Berlin and St. Petersburg, and of the Royal Societies of London and Göttingen; and in 1785 was made a foreign associate of the Academy of Sciences at Paris, being the only Dutchman, except Boerhaave, who had attained that honour. He was also a member of the state-council of the United Provinces, and a deputy in the assembly of the States of the Province of Friesland. He died of a violent

pleurisy on the 7th of April 1789, in the sixty-seventh year of his age, leaving behind him the well-earned reputation not only of a distinguished anatomist and philosopher, but of an honest man.

The works, or rather detached essays of Camper, are exceedingly numerous. Besides his 'Demonstrations Anatomico-pathologicae,' of which two parts only appeared, the one containing the structure and diseases of the human arm, the other the structure and diseases of the human pelvis, he published separate dissertations upon the following among other subjects:—on the 'Sense of Hearing in Fishes;' on the 'Physical Education of Children;' on 'Inoculation for the Small-pox;' on the 'Origin and Colour of Negroes;' on the 'Signs of Life and Death in new-born Children;' on 'Infanticide, with a project for the Establishment of a Foundling Hospital;' on the 'Operation of Lithotomy at two different times according to the celebrated Franco;' &c. He also presented the following memoirs to different societies: on the 'Callus of Fractured Bones;' on the 'Advantages and best Methods of Inoculating for the Small-pox;' on the 'Theory and Treatment of Chronic Diseases of the Lungs,' &c.; on the 'Construction of Trusses, and the best method of tempering steel for these instruments;' on the 'Structure of the great bones of Birds, and the manner in which atmospheric air is introduced into them;' on the 'Cure of Ulcers;' on the 'Characteristic marks of Countenance in Persons of different Countries and Ages,' which was afterwards published by his son in 4to in 1791, and followed by the description of a method of delineating various sorts of heads with accuracy; on the 'Discovery of the Glands in the Interior of the Sternum;' on 'Contagious Diseases among Cattle;' on 'Specific Remedies;' on the 'Effects of Air, Sleep, &c. in the cure of Surgical Disorders;' on the 'Nature, Treatment, &c. of Dropsy;' on 'Physical Beauty;' on the question, 'Why is Man exposed to more Diseases than other Animals?' and on the 'Fossil Bones of unknown and rare Animals.' In 1792 his son published a sequel to the work on the natural difference of features, &c. entitled 'Lectures of the late Peter Camper on the manner of delineating the different emotions of mind in the countenance,' &c.; and in 1803 a collection of his works appeared at Paris in 3 vols. 8vo, with a folio atlas of plates under the title of 'Œuvres de Pierre Camper qui ont pour objet l'Histoire Naturelle, la Physiologie, et l'Anatomie Comparée.' His 'Icones Herniarum' was published at Frankfurt by Soemmering, 1801, folio. Among the more prominent points in his works, we may mention his discovery of the presence of air in the bones of birds; his demonstration that the curvature of the urethra is greater in children than in adults; his remarks on the variation of the facial angle in different nations; and his osteological investigations into lost races of animals.

CAMPI, the name of a celebrated family of painters of Cremona.

GIULIO CAMPI, the eldest and master of the others, according to Lanzi, was the Ludovico, and Bernardino the Annibale, comparing them with the Caracci as a school. Giulio was born about 1500, and died in 1572. He was the scholar of Giulio Romano at Mantua, and contributed greatly to the dissemination of the principles of the Roman school throughout Lombardy, where his works, as well as those of all the Campi, are very numerous. In many instances he has combined the vigour of design of Giulio Romano with the colour of Titian, but his works are in various styles.

ANTONIO CAMPI, brother of Giulio, was living in 1536, and as late as 1591. He was an architect as well as a painter, and wrote a history of Cremona which has been highly praised: it contained numerous plates drawn and many of them engraved by himself.

VINCENZO CAMPI, also a brother of Giulio, was born before 1532 and died in 1591. He painted many religious subjects, but excelled most in portraits and fruit pieces.

BERNARDINO CAMPI, cousin of Giulio, was born in 1522, and died about 1590. Though instructed by Giulio, he adopted a different style from his cousin, and is generally allowed to have surpassed him. They were both very similar in colour, but in design Bernardino was more chaste than Giulio and less robust. He was also an excellent portrait painter. He was originally a goldsmith, and was induced to adopt painting from seeing two tapestries worked from designs by Raffaele, whose simplicity of style he always adhered to. Some of the greatest works in Cremona and Mantua were painted by Bernardino: his masterpieces are the frescoes of the cupola and other works in San Sigismondo at Cremona, which for paintings is one of the richest churches in Italy. Bernardino painted the cupola in seven months. A 'Nativity' in the church of San Domenico is one of his finest pieces.

(Lanzi, *Notizie Istoriche de' Pittori, &c., Cremonesi*; Lanzi, *Storia Pittorica, &c.*)

CAMPOMANES, COUNT PEDRO RODRIGUEZ, a distinguished Spanish civilian and statesman of the 18th century, was born in Asturias in 1723. During his early years he travelled and observed much, and studied diligently the works of English and other writers on philosophy and political science. In 1765 he was appointed fiscal advocate to the royal council of Castile, and afterwards minister of state. He was a friend of Aranda, and took part in the expulsion of the Jesuits by that minister. [ARANDA.] He laboured zealously to rouse the industry of Spain from its state of torpor, and wrote several good works on the education of the people, and especially of the artisans. Under the ministry of Florida Blanca, Campomanes was removed from the council, and lived afterwards in retirement until his death, which

occurred in 1802. He was director of the Spanish academy of history, one of the few useful learned institutions of Spain, and was also a member of the Academy of Belles Lettres of Paris, and by the recommendation of Franklin, a member of the Philosophical Society of Philadelphia. His principal works are 'Antigüedad Marítima de la República de Cartago,' with a translation of the 'Periplos of Hanno,' illustrated by copious notes, 4to, Madrid, 1756. 'Discurso sobre el Fomento de la Industria Popular,' 8vo, Madrid, 1774. 'Discurso sobre la Educación Popular de los Artesanos, y su Fomento,' 8vo, Madrid, 1775. In this last treatise he combated the idea, then general in Spain and most other countries of the continent, that mechanical professions were in their nature low and abject. "Let the mechanical arts be improved and ennobled by the assistance of education and scientific knowledge; let the artisans raise themselves by their skill, industry, and conduct, and the prejudice against the mechanical professions will give way." These propositions of Campomanes appear now self-evident, but in his time, and especially in Spain, they sounded like a paradox, and it required a considerable degree of moral courage to assert them. As a continuation of the same subject, Campomanes wrote, 'Apéndice a la Educación Popular,' 4 vols. 8vo, Madrid, 1776-77; a work abounding with important information and valuable ideas on the subject of popular progress. It also treats of the laws affecting manufactures and the mechanical arts, and the best means of extending and improving them. Campomanes wrote also an historical dissertation on the order of the Templars, and a treatise on the mortmain property possessed by convents and other ecclesiastical bodies, in which he expressed opinions which drew upon him the hostility of several powerful dignitaries of the church, and probably contributed to his removal from office.

CAMUCCINI, VICENZO, one of the most distinguished modern Roman painters, was born at Rome about 1775. Left an orphan at an early age, he was instructed in design under the care of a brother, Pietro, who followed the calling of a restorer of old pictures. For many years Vincenzo earned his living by copying the works of the great masters. The first original works by which he attracted notice were subjects from early Roman history. His 'Infancy of Romulus and Remus,' 'Horatius Cocles,' and others, gained him great applause; and his 'Death of Camar' and 'Death of Virginia' were purchased for the private collection of the King of Naples. Having once gained the approbation of the Roman connoisseurs Camuccini never lost it. He always painted in that 'classic' style which the modern Italians have so long looked upon as the highest excellence. Even in his religious pieces, which are very numerous, the academic model is never lost sight of. To an eye accustomed to the licence of English painters, Camuccini appears intolerably constrained and formal; but in Rome he is perhaps still regarded as one of the greatest of modern painters. In his lifetime he received an ample share of wealth and honour. The pope appointed him inspector-general of the papal museums and of the mosaic works, and keeper of the collections of the Vatican. For many years he was director of the Academy of St. Luke, and director of the Neapolitan Academy at Rome. Pius VII. created him a baron; the emperor Francis I. of Austria conferred on him the Order of the Iron Crown; and he was elected a member of the Institute of France. As the head of the Academy of St. Luke, and possessing an excellent collection of paintings by the old masters, sculptures, and choice engravings, he during many years was regarded as the great arbiter of taste in Rome; and his practice, precept, and influence gave a strong bias to the course of the young painters of that city. Besides his paintings from classical and sacred history, Camuccini painted numerous portraits, including that of Pope Pius VII. He practised occasionally in fresco as well as in oil, and several of his designs have been executed or copied in mosaic. Many of his more important works have been engraved by Bellini and others; and a series of lithographs by Sandellari from his pictures and designs was published at Rome in 1829, with the text in Italian and French, under the title 'I Fatti principali della Vita di Gesù-Cristo,' 2 vols. folio. Camuccini died at Rome, September 2, 1844. (Nagler, *Neues Allgemeines Künstler-Lexicon*; *Ann. des gens du Monde*; *Novv. Biog. Universale*.)

CAMUS. We insert this article principally to make the distinction between several mathematicians of this name.

1. FRANÇOIS JOSEPH DES CAMUS, born 1673, died 1732, author of 'Traité des Forces mouvantes,' 1732, and editor of Varignon's 'Mécanique,' 1725. He died in England, whither he had come in search of employment.

2. CHARLES ETIENNE LOUIS CAMUS, born 1699, died 1768, was the companion of Clairaut, Lemonnier, and Maupertuis in the measurement of the meridians in Lapland, author of the 'Hydraulique,' 'Cours de Mathématiques,' and a list of works which may be found in Hutton's 'Dictionary.' He was also concerned in the verification of Picard's degrees, 1747.

3. NICHOLAS LE CAMUS DES MÉZIERES, born 1721, died 1780, author of various works on architecture, his profession.

CANAL, ANTONIO, called Canaletto, was the son of Bernardo Canal, who, although descended from one of the noble families of Venice, followed the profession of a scene-painter. Antonio was born at Venice about 1697. He originally followed his father's occupation; and the style of his early practice may be traced in the boldness and

vigour of his later works, and the reality of the effect. About the year 1710, disgusted with the petty annoyances of the theatre, he abandoned it altogether, and went to Rome, where he employed himself for a long time in studying from the ancient ruins. On his return home, he devoted himself to painting views in the city, and original compositions. In the latter part of his life he visited London, where he was in great estimation.

His handling is light, bold, and firm; his colouring generally bright, true, and pleasing; his figures well disposed. He has displayed no less art in his choice of subjects and sites, and disposal of all the separate parts, than in the treatment and execution. He was one of the few artists who have made use of the camera obscura with a view to quickly obtaining perspective effect, and though Lanzi observes that he was careful to avoid its misapplication, many of his pictures appear to us to bear too evident traces of having been studied by its means. But after every admission is made, there can be little question that Canaletto is the first painter in his particular branch of art. In his pictures the palaces of the Adriatic are brought before the eye with much of the vivid beauty of the actual scene; and his original compositions, in which the ancient and the modern are blended, partake of the reality of his views. His works may be seen in every collection.

His pupil Guardi is the most eminent of his followers. He paints in a style which is brilliant and agreeable, but less solid and less exact than his master's. (Zanetti.)

CANCELLIERI, FRANCESCO, born at Rome in 1751, after studying in the Roman college under the Jesuit professors Cunich, Cordara, and Zaccaria, became secretary to the senator Rezzonico, and afterwards librarian to the learned Cardinal Antonelli, Prefect of the Propaganda. In 1778 he edited a newly discovered fragment of the 91st book of Livy, with a preface. On the occasion of the new sacristy added by Pius VI. to the Basilica of the Vatican, Cancellieri undertook a work of historical and liturgical erudition on the ancient office of Secretary of that Basilica, 'De Secretariis Basilicæ Vaticanæ,' 4 vols. 4to, Rome, 1788, which contains an ample store of information concerning the Basilica, its early history, its vaults, its library, its former monastery, the circus of Caligula and Nero, with illustrations of numerous monuments and documents. This work was received with great applause by the learned, and the author was placed among the first writers on church antiquities. He afterwards published a 'Descrizione del Carcere Tulliano,' a notice on the statues of Pasquino and Marforio, as well as various treatises on the origin and meaning of the ceremonies which are performed in St. Peter's church and in the pontifical chapel of the Vatican on great festival days. 'Descrizione dei tre Pontificati che si celebrano nella Basilica Vaticana per le Feste di Natale, di Pasqua, e di S. Pietro,' 'Descrizione delle Funzioni che si celebrano nella Cappella Pontificia per la Settimana santa,' 'Notizie intorno la Novena, Vigilia, Notte, e Festa di Natale,' 'Descrizione delle Cappelle Pontificie e Cardinalizie di tutto l'Anno,' 'Storia dei solenni Possessi dei sommi Pontefici da Leone III. a Pio VII.,' 'Memorie storiche delle sacre Feste dei SS. Apostoli Pietro e Paolo, e della loro solenne Ricognizione nella Basilica Lateranense fatta da Pio VII.,' 'Descrizione della doppia Illuminazione della Cupola di S. Pietro a Lanteroni e Fiaccole, e della Girandola della Mole Adriana.' Most of these treatises have been translated into French.

When the French revolutionists drove away Pius VI. from Rome, in February, 1798, Cancellieri was separated from his patron Cardinal Antonelli, who was arrested and sent to Civitavecchia. Some years after, when Pius VII. took possession of Rome, Cancellieri was appointed director of the printing press of the Propaganda. In 1804 he accompanied Cardinal Antonelli to Paris, on the occasion of Napoleon's coronation. He kept a diary of that journey, from which many entertaining extracts are given in Baraldi's 'Life of Cancellieri.' When the French invaded Rome a second time, in 1808, Cardinal Antonelli was banished to Sinigaglia, where he died in 1811. At the restoration of Pius VII. Cancellieri was reinstated in his office. He continued to write works of antiquarian erudition until 1826, when he died at Rome. The year before, he had at his own expense raised a handsome cenotaph with a biographical inscription to his patron, Cardinal Antonelli, in the Basilica of the Lateran, below which he desired by will to have himself buried. He published an account of this monument: 'Cenotaphium Leonardi Antonelli,' Pesaro, 1825. Among the printed works of Cancellieri, which exceed 160 in number, the following, besides those already mentioned, are deserving of notice: 'Il Mercato, il Lago dell'Acqua Vergine, il Palazzo Pamfiliano nel Circo Agonale,' &c., 4to., Rome, 1811. This is an erudite description of a most interesting district of the city of Rome. 'Dissertazione intorno agli Uomini dotati di gran Memoria, e a quelli divenuti Smemorati,' 1815; 'Descrizione dell'Uso di rappresentare la Befana nell'Epifania.' This refers to one of the popular customs of Rome. 'Notizie sopra l'Origine e l'Uso dell'Anello piscatorio e degli altri Anelli ecclesiastici,' 1823; 'Lettera sopra l'Origine delle Parole Dominus e Dominus, e del Titolo di Don,' Rome, 1808; 'Dissertazioni epistolari sopra Cristoforo Colombo e Giovanni Gerson,' 1809. Many of his minor works have appeared in the 'Effemeridi Letterarie,' 'Notizie del Giorno,' 'Giornale Arcadico,' and other journals. There is a list of his inedited works, amounting to eighty.

(Tipaldo, *Biografia degli Italiani Illustri*.)

CANDACE, the name or title given to the warrior queens of Ethiopia in the later period of the kingdom of Meröe. The Candace whose name occurs in history invaded Egypt in B.C. 22, that country being then in possession of the Romans, and compelled the Roman garrisons of Syene, Elephantine, and Philæ to surrender. Caius Petronius, the prefect, marched against her, defeated her near Pselcha, and ravaged a portion of her territory. On his withdrawal, she attacked the garrisons he had left at Premnis, on hearing which he returned and again defeated her troops. On this she sent an embassy to Augustus, who was then at Samos, to sue for peace, and the emperor not only granted her prayer, but remitted the tribute which Petronius had laid upon the country.

* **CANDLISH, ROBERT SMITH, D.D.**, one of the most influential ministers of the Free Church of Scotland, has been an active public man in the conduct of ecclesiastical affairs in Scotland for the last twenty years. He was educated for the ministry in the Established Church of Scotland, and, after receiving licence as a probationer, was for some time engaged as an assistant minister in one of the parishes of Glasgow. In 1834 he was settled in the parish of Sprouston, in the presbytery of Kelso, from which he was translated soon afterwards to the parochial charge of St. George's, Edinburgh, one of the most wealthy and fashionable churches in the Scottish metropolis, the appointment to which lay in the then recently-reformed Town Council of Edinburgh. The agitation for church reform followed close upon the successful struggle for the extension of political privileges, and in the conduct of that agitation Dr. Candlish bore a leading part, in conjunction with Drs. Chalmers, Cunningham, Gordon, Welsh, and a few earnest laymen. That struggle issued, as is well known, in the great Disruption of 1843. We have here no further concern with its history than to note the remarkable fact that the Free Church of Scotland, since its establishment in the year just named, has, for its various schemes of home and foreign missionary and educational effort, in all of which Dr. Candlish has taken a leading part, raised from the voluntary efforts of its members and supporters about three millions sterling. Dr. Candlish has been uniformly returned by the Free Presbytery of Edinburgh as one of its representatives in the General Assembly of the body, although the usual rule of rotation would allow of his return only once in three or four years. Previous to the Disruption, the adherents of the non-intrusion party belonging to St. George's Church, in anticipation of the result of the 'ten years' conflict,' as the agitation has been designated, had resolved to erect a plain building as a kind of model for the new places of worship which were expected to be found necessary in all parts of the country. This building, situated on Castle-terrace, and now occupied by the Free Gaelic Congregation, was soon found too small and inconvenient for Dr. Candlish's new congregation (Free St. George's), who accordingly erected, at a cost of about 15,000*l.*, a commodious and handsome church in the Lothian Road. Dr. Candlish has been since offered the post of Professor of Divinity in the New College belonging to the Free Church; and in 1855 he was invited to remove to Glasgow, to take the pastoral charge of a church in that city, but he declined both, and retains his position as pastor of Free St. George's. He received his diploma of D.D. from an American university. He has published numerous pamphlets and single sermons, a treatise on the doctrine of the Atonement, 'Contributions to the Exposition of the Book of Genesis,' an 'Examination of Maurice's Theological Essays,' and a few other works on religious subjects.

CANDOLLE, DE. [DE CANDOLLE.]

CANGA, ARGUELLES, JOSÉ, a Spanish statesman and author, was born in the Asturias about 1770. He was a conspicuous member of the Cortes of 1813-14, and on the overthrow of liberalism by the return of Ferdinand in the latter year, was for some time banished, or according to Galiano imprisoned. In the second constitutional period of modern Spain, commencing with the outbreak of 1820, he was Minister of Finance; proposed some measures interfering with church property, and in 1822 resigned with his colleagues on a constitutional question. He was obliged in the next year to take refuge in England from the second triumph of the Absolutists backed by the arms of France, and resided in London for the seven years which followed. "After having been engaged in some periodical publications in defence of the constitutional cause," says Galiano, also a refugee, "he suddenly became the apologist of Ferdinand, wrote against his fellow-exiles, and strange as it may appear, spared not invectives against his own acts as a minister, by strongly protesting against the recognition of the Cortes' bonds by the Spanish government, although the loan entered into by the first Cortes was contracted by himself in his official capacity." He was soon afterwards permitted to return to Spain, and after the 'Estatuto Real,' was for the third time a member of the Cortes, but not a conspicuous one. He died in 1843.

Canga Arguelles was the author of numerous works, of which two produced during the leisure of his exile in England are by far the most important. One of these the 'Diccionario de Hacienda,' or 'Dictionary of Finance' (5 vols. 8vo, London, 1827-28, afterwards reprinted at Madrid), is abundant in information on matters of Spanish finance and taxation, not easily found elsewhere, but unhappily bears the reputation of being far from accurate. The other, 'Observaciones sobre la Historia de la Guerra de España,' or 'Observations on the History of the Peninsular War, written by Clarke, Southey, London-

derry, and Napier,' is interesting as showing the views of the great contest taken by a Spanish liberal who was a near witness of the events. It would be unjust not to remember that at the time of writing it, the author was smarting under the somewhat cavalier tone in which Colonel Napier thought fit to speak of his country, but it should also not be forgotten on the other hand, that the strong accusations which this work contains of selfishness on the part of England towards Spain were published in London by a Spanish refugee, who was then in receipt of a bounty pension from the British government. The publication of this work had no doubt a share in procuring its author leave to return to Spain, as an edition of it which was issued at Madrid bears in the earlier volumes an intimation that it is published 'by permission,' and in its later 'by order' of the Spanish government. The favour it copacitated seems to have extended even to the printer, for the first edition (London, 1829-30, 5 vols. 8vo) is executed by 'D. M. Calero.' Frederick's-place, Goswell-road, and the second by 'Don Marcelino Calero' of Madrid.

CANGE, CHARLES D. S. DU. [DUCANGE.]

CANNING, GEORGE, was born on the 11th of April 1770, in the parish of Marylebone, London. His descent on the paternal side was from an ancient family, his ancestors having figured at different periods at Bristol, in Warwickshire, and in Ireland.

Canning's father died in 1771, when his son was only a year old. His mother, who was afterwards twice married, lived to see her son occupy a high post in the government. The expense of his education was defrayed in part by his paternal uncle, a merchant in the city of London. George Canning was first sent to Hyde Abbey school, near Winchester, whence he was removed to Eton. He had begun to write English verses when very young, and at Eton, in his sixteenth year, he formed the plan of a periodical work called 'The Microcosm,' which was written by himself and three schoolfellows, and published at Windsor in weekly numbers from November 1786 to August 1787. In October 1787 Mr. Canning was entered as a student of Christ Church, Oxford, where he gained some academical honours by his Latin poetry, and cultivated that talent for oratory which he had begun to display at Eton. At Oxford he made the acquaintance of Mr. Jenkinson, afterwards Earl of Liverpool, who is supposed to have been of service to him in the political career on which he entered immediately after leaving college. His college vacations were chiefly passed in the house of Mr. Sheridan, who introduced him to Burke, Fox, Lord John Townsend, the Duchesse of Devonshire, and other leading persons, who were almost exclusively of the Whig party in politics. It has generally been stated that it was by the advice of Sheridan that Mr. Canning, who had entered of Lincoln's Inn, gave up the study of the law, and devoted himself to a political career. From his intimate connexion with Sheridan it was expected that he had fully adopted that gentleman's political opinions, and would join the opposition; but Mr. Canning accepted the proposals of the Tory party, and was brought into parliament by Mr. Pitt in 1793. Here his first care was to make himself well acquainted with the forms and usages of the House of Commons, and he prudently refrained from speaking during the first session that he sat in parliament. In January 1794 he first ventured to address the house; and although he rather too obviously imitated the style and manner of Burke, he showed such powers as commanded respect and general attention. The subject of the debate on which he spoke was a treaty (coupled with a subsidy from England) with the king of Sardinia to enable his majesty to resist the invasion of Piedmont by the French. During that session and the session of 1795 Mr. Canning spoke frequently, and at times was left by Mr. Pitt to bear the brunt of a formidable debate. At this time he supported the temporary suspension of the Habeas Corpus Act, and declared himself against parliamentary reform, a declaration which he repeated on several occasions up to the latest period of his career.

In 1796 Mr. Canning became under-secretary of state, and at the general election in that year he was returned for the treasury borough of Wendover, Bucks. In 1798 he exerted himself in favour of Mr. Wilberforce's motion for the abolition of the slave-trade; and in a speech which produced a very considerable effect in the house, he replied to Mr. Tierney's motion for recommending George III. to make peace with the French republic, then in the full career of conquest and spoliation. In the autumn of 1797 Mr. Canning, in conjunction with Mr. John Hookham Frere, Mr. Jenkinson, Mr. George Ellis, Lord Clare, Lord Mornington (afterwards Marquis of Wellesley), and one or two other social and political friends, started a paper styled 'The Anti-Jacobin,' the object of which was to attack the journalists and other writers of the day who advocated or were supposed to advocate the doctrines of the French revolution. Mr. Gifford was appointed editor of this weekly paper, but Canning wrote the prospectus, and from its commencement in November 1797 to its close in 1798, he contributed largely to it. Some of the best of the poetry, burlesques, and jeux-d'esprit were from his pen. ('Poetry of the Anti-Jacobin,' 1 vol. 8vo.)

When the subject of the Irish union was brought before parliament, Mr. Canning repeatedly spoke at great length and with much effect in support of that measure. In 1799 he was appointed one of the commissioners for managing the affairs of India. In 1800 he married Joanna, the youngest daughter of General John Scott of Balconie, an

officer who had acquired great wealth. This union made him perfectly independent of place, for his wife's fortune exceeded £10,000. On the dissolution of Mr. Pitt's cabinet in 1801 Canning retired with the rest, and for several successive sessions his declamation, wit, and keenness of irony, lent a formidable strength to the opposition arrayed against the Addington administration. On Mr. Pitt's return to office in 1804, Mr. Canning was named treasurer of the navy.

In 1805 he defended with great but unsuccessful eloquence Lord Melville, the ex first lord of the Admiralty, who was accused by Mr. Whitbread and others of having made an unfair use of public money. Pitt died in January 1806; in February there was a complete change of ministers, and Mr. Canning was succeeded by Mr. Sheridan as treasurer of the navy. In April 1807 he again accepted office, and was appointed secretary of state for Foreign Affairs in the new cabinet formed by the Duke of Portland. Of all the departments of government this was probably the one he was best qualified for: his despatches were lucid, manly, and spirited, and many of his state-papers are models of that kind of composition. On the 21st of September 1809 Mr. Canning fought a duel with his colleague Lord Castlereagh. The quarrel mainly rose out of the Walcheren expedition, and led to the resignation of the Duke of Portland and Mr. Canning, as well as of Lord Castlereagh. Mr. Canning had always been in favour of Catholic emancipation, and on the 21st of April 1812 he eloquently supported Mr. Grant, who moved that the Catholic claims should be referred to a committee of the whole house. Again, on the 22nd of June 1812, Mr. Canning moved that the house should take the Catholic question into consideration early in the next session, and the resolution was carried by a majority of 129. The history of Catholic emancipation shows how largely the final success of that measure was owing to the untiring exertions and eloquence of Mr. Canning, though he did not live to see it carried.

Parliament being dissolved in 1812, Mr. Canning was elected for *Exeter*, which also returned him in 1814, in 1818, and again in 1820. In October 1814 he was sent ambassador to the Prince Regent of Portugal, an appointment which was afterwards the subject of severe calumnies in parliament. In the autumn of 1816 he became president of the Board of Control. In June 1820, when the conduct of Queen Caroline, the wife of George IV., was brought before parliament, Mr. Canning rather than bear any part in the proceedings resigned his office, and went to make a tour on the continent. In 1822 he was named Governor-General of India, and having made all his arrangements for leaving England, he was at Liverpool to take leave of his friends and constituents, when Lord Castlereagh (then the Marquis of Londonderry, and at the head of foreign affairs) committed suicide on the 12th of August of that year. On the 16th of September following, Mr. Canning, who had been entreated to give up his much more profitable Indian place, was again appointed secretary of state for Foreign Affairs. Declining to interfere in the troubled state of Spain, where "the spirit of unlimited monarchy and the spirit of unlimited democracy" were in fierce collision, Mr. Canning turned his attention to the New World, and came to the resolution to send out emissaries to the principal states of Spanish South America. This was a preliminary to the recognition of the independence of those new governments, which, though totally unsettled, were *de facto* free of Spain. Early in 1825 he formally notified to Europe that the British government would appoint diplomatic agents to Colombia, Mexico, and Buenos Ayres; and conclude treaties of commerce with those states on the basis of the recognition of their independence. In December 1825 he announced the intention of government to prevent Spain, who had lost her constitution, from interfering with Portugal, whose constitution still lingered feebly on; protesting at the same time that the British troops were to go to Lisbon, "not to rule, not to dictate, not to prescribe constitutions, but simply to defend and preserve the national independence of an ally."

In February 1827, the Earl of Liverpool, the premier, becoming incapacitated, on the following 12th of April Mr. Canning was appointed his successor. No sooner was this appointment announced, than the Lord Chancellor (Eaton), the Duke of Wellington, Earl Bathurst, the Earl of Westmorland, Viscount Melville, Lord Bexley, Mr. (afterwards Sir Robert) Peel, with various members of the household, resigned in a manner which showed decided hostility to the new premier. These resignations threw Mr. Canning upon the support of the Whigs, some of whom took office with him, and others, at the head of whom were Mr. Brougham, Mr. Tierney, and Sir Francis Bouverie, promised their co-operation. The opposition to the new premier in the House of Commons was of a most formidable and irritating character; but though he was labouring under anxiety and sickness, his rhetorical powers and his sparkling wit never failed him. It was in these speeches that he repeated his determination to oppose parliamentary reform, and declared himself hostile to the repeal of the Test and Corporation Acts. On the Test Act however he had never before fully delivered an opinion to the House; and his opposition to its repeal, or the agitating that question then, may be said by those, who in other respects approve of Mr. Canning's political career, to have arisen out of a fear of complicating and prejudicing the Catholic question. Conceding to Mr. Canning his full share of merit for his exertions in favour of Catholic emancipation, we cannot on a calm review of his political life, admit that he had those enlarged views of

social reform, or those powers and acquisitions which entitle him to be considered a great statesman. Mr. Canning spoke in parliament for the last time on the 29th of June 1827, three days before a prorogation. On the 6th of July, a treaty combining England, France, and Russia, for the settlement of the affairs of Greece, and of which he had been the main promoter, was signed at London. This was the last of Mr. Canning's public acts: one of the first poems he wrote in the enthusiasm of youth, was a lament on 'The Slavery of Greece.' About the middle of July, Mr. Canning retired for change of air to the Duke of Devonshire's Villa at Chiswick, where he died on the 8th of August 1827. His speeches with a memoir have been published in 6 vols. 8vo. He left a son, CHARLES JOHN, born in 1812, who on the death of his mother in 1823 became VISCOUNT CANNING. He was under secretary of state for Foreign Affairs in 1841; afterwards became Commissioner of Woods and Forests in Sir Robert Peel's ministry; was subsequently made Postmaster-General; and in the beginning of 1856 succeeded Lord Dalhousie as Governor-General of India, the post to which his father had been nominated in 1822.

CANO, ALONSO, a very celebrated Spanish painter, sculptor, and architect, was born at Granada, in March 1601. He was educated in Seville, whither his father, an architect, had removed; and he studied sculpture there, under J. Montanes, and painting under Pacheco and Juan de Castillo, all men of celebrity; but Cano's true masters in design were some ancient statues in the Casa de Pilatos, belonging to the Duke of Alcala. Cano is called the Michel Angelo of Spain; in some respects they were similar, but the similarity is more in the extent of their abilities than in the quality. Cano, as did also Michel Angelo, obtained his reputation first by sculpture. As early as 1630, he had earned such celebrity, that he was appointed painter to King Philip IV. of Spain, and had the superintendence of various architectural works in the royal palaces of Madrid and in the city. After various adventures in the principal cities of the south of Spain, Cano died at Granada, in 1667, leaving a numerous school, but he had not a single scholar who approached him in ability. His works, which are conspicuous for vigour of design, richness of colour, and boldness of execution, are very numerous; there are many at Seville, Xeres, Cordova, Madrid, the Escorial, Toledo, Alcala de Henares, Cuenca, Avila, Valencia, Murcia, Malaga, and Granada, where, in the church of San Diego, a 'Conception of the Virgin' with angels is considered his masterpiece.

Cano was of a singular disposition and of a violent temper, which on more than one occasion placed him in great danger of the Inquisition. He was accused of having assassinated his wife out of jealousy; but the charge rests solely upon the testimony of Palomino, who wrote many years after the event which gave rise to the rumour. Canan Bermudez sought in vain for a record of any process against him. The story is, that at Madrid, in 1643, when he returned home one evening, he found his wife assassinated, his house robbed, and an Italian assistant who used to live with him had absconded; but notwithstanding the presumptive evidence against the Italian, Cano was himself accused of the murder, and was put to the rack; no confession however being elicited from him, he was released and absolved of the charge. Upon his plea of 'excellens in arte,' his right arm had been exempted from the torture. Another story is that in 1658, when he was in Granada, a councillor of that city commissioned him to make a small figure of Saint Antony of Padua. When finished, Cano asked 100 pistoles for it, and on the councillor complaining of the largeness of the sum, Cano dashed the saint to pieces on the pavement, to the consternation and horror of his employer, who made all haste out of the house of a man who could so unceremoniously demolish a saint. The act was in fact a capital offence; but it appears to have been unknown to the Inquisition. A similar destruction of an image of the Virgin caused the death of Torrigiano, who was convicted of heresy, and died in prison before his sentence was carried into effect. Cano is said also on his death bed to have refused to take the crucifix presented to him by the priest, on account of its bad workmanship.

(Palomino, *Museo Pictorico*, &c.; Cumberland, *Anecdotes of eminent Painters in Spain*; Canan Bermudez, *Diccionario Historico*, &c.)

CANO'NICA, LUIGI, one of the most eminent of Cagnola's contemporaries [CAGNOLA], was born at Milan in 1742. He executed many public and private buildings at Milan; among the most celebrated of those and that which is the most remarkable for its purpose and character, is the so-called Arena, or Amphitheatre, which, in regard to mere extent of plan, more than rivals the Colosseum at Rome, being an ellipsis of about 800 by 400 feet; but it is comparatively a mere spacious inclosure, surrounded by not more than eight rows of gradins, or seats, rising no higher than 20 feet from the ground. The principal entrance is at one extremity; and on one side in the centre of the longer axis, is an elevated pulvinaire, or loggia, intended for the viceroy, and adorned with eight Corinthian columns of red granite. This singular edifice was begun in 1805, by order of Napoleon, who then sought to propitiate the Milanese by embellishing their capital.

Canonica was employed on several other buildings at Milan, but the beautiful Palazzo Bellotti is not his, although it has been attributed to him. His chief works there are the Palazzo Orsini (the interior), the Casa Canonica, and the two theatres, R6 and Carcano. He also built theatres at Brescia and Mantua; and at Parma one was executed from his designs, by Bettoli. Canonica died at Milan in February

1844, leaving a considerable fortune, and making several munificent bequests, one of them the sum of 174,000 francs (about 7000*l.*) to the Primary Schools of Lombardy; another 87,000 francs to the Milan Academy of Fine Arts, the interest of which is to be devoted annually to the education and support of some young artist, architect, painter, or sculptor.

CANOPPI, ANTONIO, an Italian artist, who resided during the latter half of his life in Russia, and died at St. Petersburg in 1832 at the age of fifty-nine. He was educated by his father, who was civil engineer in the service of the Duke of Modena, and was esteemed one of the ablest of his day in that profession. But though he profited by the instruction bestowed upon him, Antonio soon relinquished science for art—construction for design. He aspired to build after the manner of Piranesi, the study of whose works filled his imagination with visions of architectural pomp, which he had afterwards opportunities of displaying when he began to paint for the stage. His first practice however was as a fresco-painter, in which capacity he was employed by many Italian nobles to decorate their saloons. At this period he obtained the notice of Canova, who did much to recommend him, and also gave him instruction in sculpture. At Venice he became scene-painter at the Fenice Theatre, and was afterwards engaged in the same capacity at Mantua, where some of the scenery executed by him was long preserved for the sake of its beauty. While he was thus winning public admiration, he fell under the suspicions of the French government in consequence of the active part he took in public affairs. Finding his personal safety threatened by the emissaries of Napoleon, Canoppi fled to Germany, and having made his way to Vienna, met there with a protector and patron in the Russian ambassador Prince Razumovsky, who proposed to him to establish himself in Russia. Accordingly, furnished with letters of recommendation by the prince, he proceeded to Moscow in 1807, where he was fully employed for several years, chiefly in adorning with mural painting and arabesque decorations the saloons of the principal nobles. The hall of the Senate thus embellished by him excited general admiration, but that and all his other labours of the kind in that capital, perished in the memorable conflagration of 1812. Just before that event Canoppi had sought an asylum at St. Petersburg, where he was already known by reputation, and was readily engaged as scene-painter at the Imperial Theatre, in which service he continued till his death, with the exception of the interval of a twelvemonth, when being ordered (1819) to travel for the benefit of his health, he visited the regions of the Caucasus. During these twenty years he produced a vast number of splendid architectural scenes for the theatre at St. Petersburg, some of which were considered wonderful performances of their kind; and the name of Canoppi was enrolled with those of Sanquirico, Quaglio, Schinkel, and other great scenicists. His engagements with the theatre did not however so completely occupy Canoppi as to prevent his exercising his pencil upon smaller subjects and enamel-pieces. These were chiefly either architectural compositions or architectural views, such as those of the Winter Palace (the one destroyed by fire in 1838), and the *Etat Major* at St. Petersburg; both of which were placed in the Gallery of the Hermitage: but he sometimes took historical and poetical subjects.

Besides having a considerable taste for literature, Canoppi wrote on various subjects appertaining to his art, perspective and architecture included; and there is one publication by him, which appeared in 1830, entitled '*Opinion d'Antoine Canoppi sur l'Architecture en général, et en spécialité sur la Construction des Théâtres Modernes.*' (*Khrudozhestvennaya Gazeta*, November 1837.)

CANOVA, ANTONIO, was born November 1, 1757, at Possagno, a considerable village in the province of Treviso, in the Venetian territory.

The father of Canova worked in marble, and was also an architect of some merit, so that his son may be said to have been initiated from childhood in the pursuit in which he became so distinguished. At fourteen years of age Canova was taken by his father to Venice, and having obtained the notice of Giovanni Faliero, a senator, he was through his recommendation received into the studio of one Bernardi Torretti; and afterwards, on Torretti's death, into that of his nephew, Giovanni Ferrari. Two baskets of fruit and flowers carved in marble for Faliero are still shown at Venice as the earliest finished productions of Canova's chisel. About this time he commenced his first work of imagination, a group of 'Orpheus and Eurydice,' which he modelled at his native village, during the time that he used to walk to Venice to attend the academy. Having now acquired some reputation, and being recommended by his first protector Faliero, he was employed on some other works, chiefly busts; and he also modelled his group of 'Dædalus and Icarus'—a work which may be said to have laid the foundation of his future fame. In the year 1779, the Cav. Zuliano was sent ambassador from Venice to Rome, and the senator Faliero, anxious to advance the studies of the young sculptor, gave him a recommendation to that functionary. In October of that year he arrived at Rome, accompanied by Fontana, a Flemish painter. His group of 'Dædalus and Icarus' was sent to him, and the account of the impression which it made is interesting. Zuliano was one of the most distinguished patrons and admirers of the fine arts, and his palace was the rendezvous of all the best artists, critics, and literati

of the day. The work of Canova being well placed in one of the saloons, a large party of connoisseurs, consisting of Cades, Volpato, Battoni, Gavin Hamilton (the painter), the Abbate Puccini, and others, were invited to dinner, and after the repast were conducted into the room where were the artist and his group. The qualities of art which they were now called upon to judge, viz., simplicity, expression, and unaffected truth to nature, were so different from that which was the mode, that for some time there was a profound silence. Gavin Hamilton at length relieved the youthful sculptor from his embarrassment, pronounced the highest encomiums upon his work, and gave him at the same time kind and valuable advice and encouragement. This liberality was not thrown away upon Canova, who, through his long career of success, always acknowledged with gratitude the important services thus rendered him by Mr. Hamilton. Canova returned to Venice, but soon after established himself in Rome, having obtained a pension from his government of 300 ducats a year for three years. His first work after his settlement there was a group of Theseus and the Minotaur; an extraordinary production for the time, and showing a feeling for the purer principles of the art, both in composition and style, quite distinct from the wretched manner that characterised the performances of his contemporaries, and of those who had for some years preceded him. His admitted superiority of talent required but little aid from the influence of his noble protectors to procure him some important employment, and he was selected to execute the monument of Ganganelli (Pope Clement XIV.) for the church of the SS. Apostoli, in Rome. This fine work was exhibited in 1787, and established at once Canova's claim to the highest rank in his profession. Before this was completed Canova had commenced his model of Rezzonico's (Clement XIII.) monument. This work is in St. Peter's, and is a splendid effort of genius, and of skill in execution. A story is told in Rome of Canova's putting on a monk's dress and cowl, and in this disguise mixing with the crowd, to hear the criticisms that were made when the work was first exposed to public view.

From this time Canova was constantly employed, and chiefly on subjects of imagination. His 'Cupid and Psyche,' his fine group of 'Hercules hurling Lycas from the Rock,' 'Theseus with the Centaur,' the 'Graces,' 'Statues of Nymphs,' 'Endymion,' &c. &c., are too well known, if not in the originals at least by casts or engravings, to require description here. In portrait Canova was considered less successful; though none who have seen his Popes Ganganelli, Rezzonico, and Braschi, will deny his power even in that branch of his art. It is fair to judge him by his best works, and the highest authorities have pronounced the head of the last mentioned Pope, Pius VI., to be a masterpiece of the art. For the union of portrait with ideal (that is elevated) form, we would instance the statues of Napoleon and of Letizia, mother of Napoleon. From among the great number of monumental groups executed by Canova besides those of the popes already mentioned, that of Maria Christina, in the church of Santa Maria de' Frari at Vienna is characterised by simplicity of composition, expression, and exquisite finish.

Canova travelled when young over part of Germany, and was twice in Paris. At his last visit, when sent there by the Roman government to superintend the removal of the works of art which had been taken to Paris by the French, and which the allies had decided should be restored to Italy, he proceeded to England, chiefly for the purpose of seeing the Elgin marbles, of which he always spoke in terms of the highest admiration, saying that the sight of such exquisite works was sufficient to repay him for his journey from Rome. His reception in England gave him the greatest satisfaction, and he took every opportunity of expressing feelings of admiration and gratitude towards this country. On his return to Rome he received a patent of nobility, and was created Marquis of Ischia. As remarkable for his unpretending modesty as for his talent, Canova never assumed his high title, though he was of course addressed by it, but to the last called himself and left his cards as Antonio Canova.

In the latter part of his life Canova was busily occupied in modelling decorations, such as a group of a Deposition and some bassi rilievi for a church which he had built in his native place; and it was at Venice, where he was staying to be near this object of his interest, that he died in October 1822, after an illness of a very few days.

Canova was rather below the common stature, and latterly stooped as he walked. His features were strongly marked, but of fine form; his nose aquiline, and his eyes deeply set and full of expression; the general character of his countenance was extremely pleasing and prepossessing.

Of most amiable and conciliating manners towards his brother artists and competitors for fame, he was also the liberal supporter and encourager of students of rising talent. He gave pensions to several whose means were insufficient without such assistance, and established out of his own purse a handsome premium for sculpture in the academy of St. Luke, at Rome, of which he was 'Principe,' or perpetual president.

In execution, and the whole treatment of his marble, Canova was unrivalled; but those who judge of sculpture by the pure principles of Greek art (or, in other words, of nature, selected and exhibited in its finest and most approved forms), will discover, in many of his works some affectation, both in the attitudes and expression, and a littleness in some of the details, which are not in accordance with

the simplicity and breadth of style of the best productions of the ancients. Admitting this to be the case (particularly in some of his latter performances), still his works exhibit so great a progress in art, and in every respect approach so much more nearly than those that had for a long period preceded them, to the excellence of ancient sculpture, that Canova must be confessed to be one of the great regenerators of the art; and his name as the restorer of a purer style of design, will always be held in honour by those who wish to see sculpture practised upon true principles. Several of the more important works of Canova are in this country. Of those in collections open to the public, the finest are in the admirable gallery of the Duke of Devonshire at Chatsworth, where, among others are the seated statue of the mother of Napoleon, a noble colossal bust of Napoleon, a 'Sleeping Endymion,' a 'Hercules,' &c., besides copies in marble and bronze from the colossal lions on Canova's monument to Clement XIV., and the 'Kneeling Magdalene'; we may add that in the same rich collection are a set of the great sculptor's modelling tools, and an excellent colossal bust of Canova by Rinaldi.

For further particulars of Canova's life and works, see chiefly *Cinghetti, Storia della Scultura*, tom. iii.; and Misarini, *Vita di Canova*, &c.

* CANROBERT, FRANÇOIS CERTAIN DE, was born of a good family, in Brittany, in 1793; and was sent, at the age of seventeen, to receive his military education at Saint Cyr. In 1830 he began his career as a soldier, having enlisted as a private. But his excellent conduct, his distinguished bravery, and his general aptitude carried him rapidly through the lower grades; he soon rose to the rank of second lieutenant, and in 1835 he went to serve in Africa. During the war in the Oran country, his zealous performance of his duties was conspicuous, he was warmly praised by his seniors in command, and made a captain. At the storming of Constantine, he was one of the first who entered the breach, in which exploit he was severely wounded; the decoration of the Legion of Honour was awarded to him at this period. In 1846 he was raised to the rank of lieutenant-colonel, and with his regiment took part in several expeditions. At length he commanded a regiment of Zouaves against the Kabyles, whom he defeated in several encounters.

In 1850, he was created a brigadier-general, and soon after he was directed to make his way through the rugged and rocky country of Narak, a duty which, despite the nature of the country, and the character of its wild and savage occupants, he with his Zouaves successfully and speedily accomplished. In 1852, the Emperor Napoleon III., whose eye had for some time been fixed upon him, appointed him one of his *maréchaux*. The following year he became a general of division.

In 1854, when the French army under Marshal St. Arnaud, was sent to the Crimea, the command of the First Division was entrusted to General Canrobert. At the battle of the Alma he was present with his division, and was wounded by the splinter of a shell. The rising fame of Bonquet had already begun to eclipse that of the other French commanders, so that in this action, as in that which followed, the name of Canrobert did not obtain the first distinction. After the death of Marshal St. Arnaud, Canrobert, in accordance with the previous directions of the emperor, took the chief command of the French army, being then only 44. Although wounded at Inkermann, on the 8th of November, he continued to fight like a common soldier at the head of his Zouaves, and had a horse killed under him. Murmurs soon after began to be heard in both the allied armies at the slow progress of the siege of Sebastopol, and the talents of both leaders were questioned. The spirit of Canrobert was wounded, and he resigned in 1855 the chief command to his own subordinate General Pelissier, but whether of his own accord or by directions of the emperor has not been publicly stated. However that may be, he resumed the command of his old division, and continued to serve with unabated zeal. Compelled at length to return to France to recruit his health, he took up his abode at Paris. The birth of an heir to the imperial throne on the 10th of March 1856 afforded Napoleon III. a gracious opportunity of showing his high sense of the services of General Canrobert, by creating him a marshal.

Equally esteemed in private, as in public life, no man possesses more of that warm goodnature which is so engaging in the true soldier. (*Lamarca's Works; Revue de Paris*.)

CANTARINI, SIMONE, called Il Pesarese, was born at Pesaro, in 1612, and in his youth was the scholar of Pandolfi; but he afterwards chose Guido Reni for his master, and lived some time with him in Bologna. He very shortly showed himself to be a formidable rival even to Guido himself; but he was of such a contemptuous and arrogant disposition, that he made enemies of all the painters at Bologna, and of other people too, so that he became at length neglected and avoided by the Bolognese, and he accordingly felt himself compelled to leave Bologna. He removed to Rome, obtained a high reputation there, and in some respects, especially in grace of conception, was pronounced to be superior to his master Guido: even Count Marazziti, himself a Bolognese, styles Cantarini the best colourist and the purest draughtsman of the seventeenth century. After spending some time in Rome, he returned to Bologna, and opened a school there, which however he gave up shortly afterwards, upon receiving an invitation from the Duke of Mantua to visit that city. At Mantua,

by his arrogance and the depreciation of others, he very soon disgusted the artists of that place, and he finally quarrelled with the duke himself, about a portrait with which the duke was not satisfied. From Mantua he went to Verona, where he died, in 1648, aged only thirty-six, under the suspicion of having been poisoned.

Cantarini was certainly a great painter, as far as execution could make him such; in the extremities he has had few rivals; he showed also great mastery in the general management of the nude; in draperies he was not so successful. He painted a few altar-pieces, several holy families, and many portraits, in which he was admirable. There is a head of Guido, when old, by Cantarini, in the gallery of Bologna, which has perhaps seldom been equalled. His masterpieces are, 'Sant' Antonio' at the Franciscans at Cagli; 'San Jacopo,' in the church of that saint at Rimini; a 'Magdalene' at the Philippines; a 'San Domenico' at the Predicants, and several others, especially the portrait of a young nun, at Pesaro. He etched also several plates in a masterly manner, some of which are sold as the works of Guido.

(*Malvasia, Poeline Pittures; Lami, Storia Pittorica*, &c.; Bartsch, *Peintre-Graveur*.)

CANTEMIR, DEMETRIUS, was born in 1673 of a family originally from Little Tartary. His father was governor of Moldavia, and Demetrius obtained of the Porte the same office in 1710. But differences arose between him and the grand vizier, in consequence of which Cantemir entered into negotiations with Peter the Great, and revolted against the Porte. After Peter's retreat in 1711 he was obliged to quit Moldavia and to accompany the Russian army. Peter gave him in compensation lands in the Ukraine, and created him a prince of the Russian empire. Cantemir died on his estate in the Ukraine in 1723. He left several works:—'History of the Origin and of the Decay of the Ottoman Empire,' written originally in Latin, and translated both into French and English; 'On the State of Moldavia,' with a map of the country; 'History of Moldavia, Ancient and Modern,' in the Moldavian language; 'Introduction to the Music of the Turks'; 'System of the Mohammedan Religion,' written in the Russian language, and dedicated to Peter the Great. Cantemir was acquainted with many languages; he was also a member of the Academy of Berlin. His son Antiochus was Russian ambassador at Paris, where he died young in 1744. He wrote several works in Russian; his 'Satires' were translated into French by the Abbé Guasco.

CANTON, JOHN, was born at Stroud, July 31, 1718. Some advances made by him in mathematics and experimental philosophy induced his father to send him to London in 1737. He then articulated himself for five years to the master of a school, with whom he afterwards went into partnership, and in this profession he spent his life.

On the invention of the Leyden phial he turned his attention particularly to electricity, and various discoveries of his not sufficiently marked to require biographical notice, though evincing great ingenuity, will be found in the references at the end of this article. He was the first who in England verified Dr. Franklin's idea of the similarity of lightning and electric fluid (July 1752). He was then a member of the Council of the Royal Society, of which, in 1751, he received the gold medal for his method of making artificial magnets. In a paper communicated in 1753 he announced the discovery (which Franklin made about the same time) of clouds being in different states of electricity. In the following year he found that the quality of the electrical excitement made by rubbing any given substance depended on the rubber, as well as on the other substance. The common pith-ball electrometer, and the amalgam of tin and mercury used for the increase of the action of the rubber, are due to him. In 1762 he demonstrated the compressibility of water, in opposition to the well-known Florentine experiment. His experiment was repeated in the presence of a committee of the Royal Society, and a second gold medal was awarded to him in 1765. In 1769 he communicated experiments in proof that the luminous appearance of the sea arises from the presence of decomposed animal matter. He died March 22, 1772. There is a life of him by his son in Kippis's 'Biographia Britannica,' abridged in Hutton's mathematical dictionary. His papers are in the 'Philosophical Transactions,' and he communicated some new experiments for Priestley's 'Histories of Electrical and Optical Discoveries.'

CANTONI, SIMONE, a recent Milanese architect of considerable note, was born at Maggio, a small village in the north of Italy, and received his first instruction in architecture from his father Pietro, who was of that profession, and did a good deal at Genoa. He afterwards went to Rome for further improvement, and on his return settled at Milan, where the first work of any note he was employed upon was the Palazzo Mellerio. Two other noble mansions afterwards erected by him in the same city are the Casa Perticati and the Palazzo Serbelloni, the former of which has engaged columns of the Ionic order, with Caryatid figures over them, against the attic; and the facade of the other (finished 1794) is remarkable for having granite columns and pilasters. Among various other works, he erected the Seminary and Lyceum at Como, the Villa Raimondi near the same town, the Palazzo Valletti at Bergamo, and the church at Gorgonzola, between Bergamo and Milan. On the destruction of the Great Council Hall in the Ducal Palace at Genoa by fire, in November 1777, Cantoni was employed to rebuild it, which he did with ability and taste, and in such a manner as to secure it from any similar accident in future. Milizia, who notices this circumstance in his 'Life of

Rocco Pennone, the original architect of the edifice, says that there is a work containing all Cantoni's designs for that purpose, but he does not specify either its title or date. Wiebeking attributes the *Arena* at Mantua to Cantoni, but it would seem erroneously, no mention being made of it in the memoir of him by Lazzari, in Tiplado's 'Biografia,' &c., where he is said to have rejected flattering invitations from St. Petersburg and Warsaw. He died March 3, 1818. Nagler, who makes no mention of Simone, speaks of a Giuseppe Cantoni of Forlì as the architect of the amphitheatre at Mantua (which was opened in 1821); therefore he is no doubt the person meant by Wiebeking.

*CANTU, CESARE, an Italian historian, was born at Brescia in 1805. Educated at Sondrio in the Valtellina, he there at an early age was appointed professor of the belles-lettres. Subsequently he resided at Como, and afterwards at Milan, which city he quitted at the revolutionary epoch of 1848, and proceeded to Piedmont, where he entered with ardour into the proceedings of the liberal party. On the suppression of the revolutionary movement Cantu returned to Milan, where he has since devoted himself to his literary labours. M. Cantu is a very prolific writer. The work by which he first became known was the 'Ragionamenti sulla Storia Lombarda nel secolo XVII.,' Milan, 1842. Certain liberal opinions in this work drew down upon him a government prosecution, and he was condemned to a year's imprisonment. He amused his prison hours by the composition of an historical novel, 'Margherita Pasteria.' But his chief work, the result of many years of diligent research, is his 'Storia Universale,' 20 vols. 8vo, Torino, 1838-46, many volumes of which have gone through several editions. It is neat, clever, and spirited in style, and liberal in spirit; and though not a work to be classed in the first rank of historic literature, is one calculated to be of great service in Italy. It has been translated into French by Messrs. Aroux and Leopardi. Cantu has published several other works, including a 'History of Italian Literature,' an account of contemporary Italian poets, a 'Storia di Cento Anni 1750-1850,' 3 vols. 8vo, Firenze, 1851. His 'Reformation in Europe' has been translated into English by F. Prandi, London, 1847. Cantu has also written a good deal of poetry as well as poetic criticism. (*Nouvelle Biographie Universelle; Conversations-Lexikon.*)

CANUTE. The island of Britain, which, compared with more northern countries was rich, fertile, and beautiful, was a constant temptation to the inhabitants of the shores of the Baltic, and of the countries now forming the kingdoms of Norway and Sweden. These Northmen possessed a navy which enabled them to make descents upon the coasts of all the countries bordering on the English seas. Besides these predatory descents upon the coast they had frequently large armies in the field, and disputed with the native princes the entire sovereignty of the southern portion of the island. They had possessed themselves by right of conquest of much of the northern coast of France, where they had a succession of princes, who became at length, in the person of William the Norman (northman), sovereign of England.

Much of the history of the Anglo-Saxon kings is the history of their contests with these formidable neighbours. The genius and military talents of Alfred for a while saved the country from their oppressions; but when he was dead, and was succeeded by a race of princes inferior to himself, the nation became less able to make an effectual resistance. Danes settled in many portions of the island, tribute was paid to them, and finally in the person of Canute, one of the greatest men in the line of this northern sovereignty, they accomplished that which they had so long desired—the entire subjugation of the Anglo-Saxon people, and the extinction for a time of the Anglo-Saxon sovereignty.

This then is the light in which we are to contemplate Canute: the king by birth and inheritance of the people now known as Danes, Normans, and Swedes, and as the man who accomplished the work of his father Sweyn in displacing the posterity of Egbert from the sovereignty of England. On the death of his father in 1014 the Danish army proclaimed Canute king of England, but it was not till after the death of Edmund in 1017 that he became sole king. He reigned about twenty years (1017-1036), during which period the country was at peace. England of all his possessions he chose for his usual residence. He died at Shaftesbury, and was interred at Winchester, the usual place of interment of the Saxon kings. In the first years of his reign he was cruel, suspicious, and tyrannical; but when he had removed all who seemed to have a claim to the throne, he ruled with mildness, and for the most part with justice. His attention to the observances of religion, and his patronage of ecclesiastics, secured for him the praise of the monkish chroniclers; and in their writings, Canute, successful in war, in peace appears humane, gentle, and religious. William of Malmesbury says of him, that by his piety, justice, and moderation, he gained the affection of his subjects, and an universal esteem among foreigners. The well-known story of the rebuke which he gave to the flattery of his courtiers makes his name and his virtue more familiar to the English nation than all the encomiums of our chroniclers, or than his acts of piety in his journey to Rome and in the foundation of the two monasteries of St. Bennet of Holme and St. Edmund's Bury.

The reigns of the two sons of Canute were short and disturbed. In 1041 the posterity of Egbert, in the person of Edward, son of King Etheldred, regained the throne. This was Edward called the Confessor.

His reign was harassed by the Danes under Sweyn, another son of Canute. They also disputed the sovereignty with Harold, the son of Earl Godwin, who assumed the crown on the death of Edward; and England might have suffered much longer from attempts of the northern chiefs had it not fallen under the sway of the race of Norman princes, who governed with a more vigorous hand than that of the Anglo-Saxon chiefs.

*CAPEFIGUE, BAPTISTE HONORÉ, RAYMOND, one of the most prolific living historians and periodical writers of France, was born at Marseille in 1801. After finishing his academic course in his native place, he entered upon the study of the law, and in order to complete his legal studies he proceeded in 1821 to Paris. But there he soon abandoned the law for politics; became a writer for the newspapers; and obtained, in consequence of some of his articles attracting the notice of the minister, a post in the Foreign Office, which he held till 1848. His official situation however appears to have interfered little with his literary labours. He was for a time editor of the 'Quotidienne,' and then became successively connected either as editor or as a leading contributor with the 'Messager des Chambres,' 'Le Temps,' 'Le Moniteur du Commerce,' 'Le Courier Français,' 'La Chronique de Paris,' 'L'Europe Monarchique,' 'La Gazette de France,' 'La Révolution de 1848,' and 'L'Assemblée Nationale;' besides writing many elaborate articles for the 'Revue des Deux Mondes.' These would seem to supply ample occupation for the leisure of an official life, but M. Capefigue is at the same time one of the most voluminous historical writers of the day. We will not inflict upon our readers the fatigue of perusing a complete list of his historical works; it will suffice for us to state that they amount in all to upwards of a hundred volumes, and to add the titles of some of the most important: 'Essai sur les invasions des Normands dans les Gaules,' 2 vols. 8vo, Paris, 1823; 'Histoire de Philippe-Auguste,' 4 vols. 8vo, Paris, 1827-29; 'Histoire constitutionnelle et administrative de la France depuis la mort de Philippe-Auguste; première époque de Louis VIII. jusqu'à la fin du règne de Louis XI.,' 4 vols. 8vo, 1831-33; 'Histoire de la Réforme, de la Ligue, et du règne de Henri IV.,' 8 vols. 8vo, 1833-34; 'Richelieu, Mazarin, la Fronde, et le règne de Louis XIV.,' 8 vols. 8vo, 1835-36; 'Louis XIV., son gouvernement, et ses relations diplomatiques avec l'Europe,' 6 vols. 8vo, 1837-38; 'Hugues Capet, et la troisième race jusqu'à Philippe-Auguste,' 10 vols. 8vo, 1839-41; 'Louis XV., et la société du dix-huitième siècle,' 4 vols. 8vo, 1842; 'Histoire de la Restauration, et des causes qui ont amené la chute de la branche aînée des Bourbons,' 4 vols. 1842; 'L'Europe pendant le Consulat et l'Empire,' 12 vols., 1839-41; 'Louis XVI., ses relations diplomatiques avec l'Europe,' 4 vols., 1844; 'La Diplomatie de France et de l'Espagne, depuis l'avènement de la maison de Bourbon,' 8vo, 1846; 'Histoire authentique et secrète des Traités de 1815,' 1847; 'L'Europe depuis l'avènement de Louis Philippe,' 10 vols. 8vo, 1849; 'Les quatre premiers siècles de l'Eglise chrétienne,' 4 vols. 8vo, 1850-51; 'Trois siècles de l'Histoire de France,' 2 vols., 1851. (*Nouvelle Biographie Universelle.*)

CAPEL, ARTHUR, LORD, was born at the commencement of the 17th century. He was returned as M.P. for Hertfordshire to the parliament which assembled Nov. 3, 1640. At first he seemed disposed to adopt the principles held by the great majority of the members, but soon changed his opinions, and devoted himself to the cause of Charles I., who created him Baron Capel of Hadham in Hertfordshire. He assembled troops in Wales and the adjoining counties, and in 1645, when Charles, Prince of Wales, was named generalissimo, Lord Capel was directed by the king, together with Sir Edward Hyde and Lord Colchester, to accompany the prince to the western counties, and direct everything in his name. In 1648 he joined the forces under Sir Charles Lucas in Essex with a troop of cavaliers from Hertfordshire, and on the 12th of June they marched together to Colchester, intending to remain there only a day or two, and then advance into Suffolk and Norfolk; but on the 13th Fairfax appeared before the walls, and the town was immediately invested. After two months of the most obstinate resistance, they were compelled by famine and sedition to surrender unconditionally, August 27. Sir Charles Lucas, Sir George Lisle, and Sir Bernard Gaseign, the three principal leaders, were immediately shot. Lord Capel was conducted as a prisoner to Windsor Castle, and thence conveyed to the Tower of London. He made his escape from the Tower, but was soon retaken, and was condemned to be hanged, drawn, and quartered. This severe sentence however was commuted, and on the 9th of March 1649 he was beheaded in front of Westminster Hall. His son ARTHUR, born in 1635, was created Earl of Essex by Charles II. He was accused of being concerned in the Rye-House Plot, and was sent prisoner to the Tower, where he was found dead some days afterwards, his throat having been severed by a razor.

CAPELL, EDWARD, was born in 1713, at Troston in Suffolk. He was educated at Bury St. Edmunds, and spent the greater part of his life at Hastings and in London, occupying himself almost exclusively in studies relating to the works of Shakspeare. He was enabled to command leisure for such pursuits by the patronage of the Duke of Grafton, who obtained for him the appointment of deputy-inspector of plays. He died on the 24th of February 1781, at his chambers in the Temple. As a commentator on Shakspeare, Capell is ranked much more highly now than he was in his own times, but he is really useful only as furnishing hints for others to work upon. There is not more

excellence in the valuable parts of his matter, than confusion, obscurity, and pedantry in his manner of expression. "The man," said Johnson, "should have come to me, and I would have endowed his purpose with words: as it is, he doth gabble monstrously." The publications written or edited by Capell are the following:—1, 'Prolusions, or Select Pieces of Ancient Poetry,' 1760, 8vo: a volume in which the most interesting part is the fine drama of 'Edward III.,' attributed by its editor to Shakspeare on grounds quite inconclusive; 2, 'Mr. William Shakspeare, his Comedies, Histories, and Tragedies,' &c., 1767, 10 vols. 8vo; 3, 'Notes and Various Readings to Shakspeare,' 1778, 4to; 4, 'A Letter to George Harding, Esq. (on a passage in Steevens's Preface),' 1777, 4to; 5, 'Notes and Various Readings to Shakspeare; to which is added, The School of Shakspeare, or Extracts from divers English Books that were in print in the Author's time,' &c., 1783, 3 vols. 4to.

CAPELLEN, GODERD ALEXANDER GERARD PHILIP, BARON VAN DER, a distinguished governor-general of the Dutch East India, was born at Utrecht on the 15th of December 1773. He lost his father, Alexander Philip van der Capellen, Heer van Berkenwoude, before he was nine years old. After studying at Göttingen under Martens and Blumenbach, with both of whom he continued in correspondence to the end of his life, he entered the public service of Holland, and became in 1809 Minister of Internal Affairs under King Louis Bonaparte, whom he strongly advised to defend the entrance of Holland by force against the armies of Napoleon, and when the French system was introduced into the country on the 1st of January 1811, accompanied to his retreat at Gratz in Styria. A coolness however arose on the part of the ex-king when he found that his late minister looked with no unfavourable eye on the rising in Holland to restore the house of Orange; and after the complete emancipation of Holland from the French yoke, Van der Capellen was in fact appointed Minister of Commerce and the Colonies, and on the 1st of August 1814 Governor-General of the Dutch East India. Owing to an important mission to the congress of Vienna, and the return of Napoleon, which gave Van der Capellen an admirable opportunity of showing his constancy and courage at Brussels on the day of Waterloo, he did not leave Europe for his post till October 1815, and a further delay occurred before he finally received Java from the hands of the English, agreeably to the arrangements made at the peace. He remained beyond the five years, which had been originally intended, and was recalled in disgrace in 1826, when he was universally censured in Holland for having effected a loan of fifteen millions of sicca rupees at Calcutta, at nine per cent., on the security of the revenues of the Dutch East India. It was said that of all measures that could be adopted the most undividable was that of pledging the Dutch possessions to the English. Van der Capellen had however shown no partiality to our nation; he had, on the contrary, strongly urged the Dutch government not to consent to the English establishment of Singapore. He had however followed up the arrangements made by Sir Stamford Raffles during the English possession of Java, and by that means an immense improvement was effected in the position and prospects of the country. He had also abolished the monopolies which under the old Dutch system pressed heavily upon the natives of Sumatra and the Moluccas, made alterations and improvements much required in the coinage, and taken measures for the abolition of the slave trade and slavery. The most unfortunate circumstance connected with his administration was the outbreak of the great revolt of Diponegoro, a Javanese chief, which lasted many years, and which on his return to Europe he left still unsubdued. On the whole however, when his administration came to be reviewed, the unpopularity which had collected around him gradually cleared off, and his merits are now universally acknowledged. He was nominated to several high posts, among others to that of ambassador to England on the occasion of the coronation of Queen Victoria, President of the Commission of Education, and President of the University of Utrecht. In February 1843 he was unfortunately on a visit to Paris, on an invitation from King Louis Philippe, who was a personal friend, when in the outbreak of the revolution he was struck on the head by a stone thrown by one of the mob. No outward injury appeared, but on his return to his seat at Vollenhoven he sank into a deep melancholy, produced partly by his feelings at the events he had witnessed, and this was succeeded by an inflammation of the brain, attributed to the blow, which carried him off on the 10th of April, 1848.

CAPET, HUGUES, the founder of the third, or, as it has been called from him, the 'Capetian' dynasty of French princes, of whom little authentic information is preserved. His own great grandfather, Count of Paris, gave him considerable predominance; and on the death of the last of the Carolingians, A.D. 987, Louis V. the Stolid ('Le Fainéant'), he successfully usurped the throne, and was confirmed in his seizure by the confederacy of turbulent barons, who yielding him as much obedience as it suited them, invested him with the nominal title of king. The origin of the name of the family has been disputed, and indeed by some has been considered as given in ridicule; but the chroniclers in general affirm that he was a knight of ancient and noble extraction, and the imputation of plebeian birth which has been advanced against him is manifestly founded upon a misconception of a well known line in the 'Purgatory' of Dante, canto xx., in which that poet satirically makes the usurper declare of himself

—"I was the son of a butcher of Paris." The commentators explain this line by adding, that Hugues the Great, count of Paris, the father of Hugues Capet, was a rigid executioner of the sentences which he had passed. M. de Sismondi, 'Hist. des Français,' iv. 38, has shown that Velly is not to be trusted in his account of the family of Capet; but the reader may be safely referred to M. de Sismondi himself, to the Preface to the third volume of the great collection, generally known under the name of Bouquet, or to the 'Preuves de la Généalogie de Hugues Capet' in 'L'Art de vérifier les Dates,' i. 566.

A single anecdote may suffice to show the little authority which Hugues possessed over his vassals. "Who has made you count?" was the inquiry which he directed a herald to put to Aldebert de Perigueux, who had assumed the title of Count of Poitiers and of Tours. "And who has made you king?" was the only reply which Aldebert vouchsafed to return by the same messenger. As a supposed atonement for the illegitimacy of his accession, Hugues himself never wore the crown. Both the dates of his usurpation and of his death are uncertain, but the former is usually fixed in A.D. 987; the latter 996. Thirteen kings (fourteen if we include John, who lived but eight days, and was never crowned) succeeded from his family: and it was not until 1328, that Philip VI. of Valois transferred the sceptre to his own race.

The party name Huguenot, which arose during the wars of the League, has sometimes been attributed to the attachment manifested by the reformed to the reigning king, the representative of Hugues Capet, in preference to the Guises, who were derived from Charlemagne. On the accession of the line of Bourbon, the name Capet was either adopted by them or given to them; and all the processes in the trial of the unfortunate Louis XVI. were directed against Louis Capet.

CAPMANY Y DE MONTALAU, ANTONIO DE, a Spanish author of high reputation in Spain, was born at Barcelona on the 24th of November 1742. He entered the army and served as an officer during the wars with Portugal in 1762, and afterwards took a share in Olavide's scheme for colonising and cultivating the Sierra Morena, to which he conducted a group of Catalan families to co-operate with Olavide's Germans. When the plan terminated in Olavide's imprisonment by the Inquisition, Capmany took up his residence in Madrid, where, with the exception of some time spent in travels in Italy, France, Germany, and England, he resided for the next five and thirty years, intrusted with various political and literary commissions by the government. On the entrance of the French army into Madrid in 1808 he took flight for Seville, and arrived at that city with nothing in his possession but the clothes he wore, and those in rags. He became an active member of the Cortes of Cadiz, and was among the multitudes swept away in that city in 1813 by the yellow fever.

Capmany's works are numerous, and are noted for the excellence of their Castilian style, though the author, by birth a Catalan, could never speak the language like a native. His 'Critical Memoirs on the Marine, Commerce and Arts of the city of Barcelona,' in three quarto volumes, are a valuable contribution to the history of the middle ages, full of curious particulars drawn from unpublished documents. Some ingenious dissertations on the introduction of gunpowder and similar subjects are contained in his 'Questiones criticae.' His 'Teatro historico critico de la Eloquencia Española' is a collection of elegant extracts, preceded by an essay on the Spanish language and literature, which is spirited and instructive, though like most of Capmany's writings one-sided and ultra-patriotic. The work on which he set the most value was a small volume or rather pamphlet entitled 'El Centinela contra Franceses,' or 'The Sentinel against the French,' an invective against the invaders of Spain, which is dedicated in terms of warm affection to his friend Lord Holland. He was well acquainted with the French language, and the compiler of an excellent French and Spanish dictionary, but in his latter years his antipathy to the nation amounted almost to a mania.

CAPO D'ISTRIA, COUNT OF, born at Corfu in 1780, was the son of a physician, and he himself began to study medicine at Venice, to which republic Corfu and the other Ionian islands then belonged. His father was chief of the provisional government of the Ionian Islands in 1799, when the Russians took possession of them. In 1806, when the Seven Islands by the treaty of Tilsit were placed under the protection of Bonaparte, both Capo d'Istria and his father left Corfu and entered the service of Russia. The count's first post was an humble one; but he showed a talent for diplomacy, and was speedily advanced and attached to the Russian embassy at Vienna. In 1812, during Bonaparte's expedition to Moscow, Capo d'Istria was charged with certain diplomatic operations connected with the army of the Danube, or, as it is more commonly called, the army of Moldavia, under the command of Admiral Tchitchagof, which had been engaged against the Turks, and then occupied the two principalities of Wallachia and Moldavia. In the summer of 1812, peace being concluded between Turkey and Russia, the latter power was enabled to recall the army of Tchitchagof from the Danube to the Berezina. Capo d'Istria went with it, and after the finishing blow given to the French at the passage of the Berezina he remained at the head-quarters of the Emperor Alexander of Russia, who formed a high opinion of his abilities and address. In 1813 he was sent by Alexander as his minister plenipotentiary to Switzerland, and, before the allied armies crossed the Rhine into that country, he drew up a declaration promising

the re-establishment of Helvetian independence, and the restitution of all the territory that the French had taken from the Swiss. These promises were well kept, and the count so conducted himself as to merit the esteem of the Swiss. The Constitutional Act, which he sanctioned and forwarded, removed many old abuses and invidious distinctions. In September 1814 Capo d'Istria left Switzerland for the Congress of Vienna, where, mainly through him, the affairs of the Swiss were happily terminated. In 1815 he was with Alexander at Paris, and was his plenipotentiary in the definitive treaty of peace with France. In the course of that year he advocated the cause of education, and wrote to the emperor an account of the establishment of M. Fellenberg at Hofwyl. This letter, in the form of a pamphlet, was published at Paris in 1816, in the course of which year the Grand Council of Lausanne gave the count the citizenship of the Canton of Vaud. A short time afterwards he was recalled to St. Petersburg by the Emperor Alexander, who appointed him one of his secretaries of state for foreign affairs, the duties of which office he divided for some time with Count Nesselrode. Capo d'Istria had a principal share in the diplomatic underminings of the Turkish empire, which took place from 1815 to 1827, and on the separation of Greece from Turkey he was allowed to take upon himself the office of president of the Greek government, in which he was regularly installed early in the year 1828, or a few months after the battle of Navarino. In this position he was almost constantly at variance with the people whom he was sent to govern. On both sides were violence, obstinacy, duplicity, and intrigue; but making many allowances for the Greeks, the opinion of most of those who watched his administration in the country was very unfavourable to the count, who it appeared pretty evident was desirous to render Greece wholly subservient to Russia. Some memorable letters which he wrote to Prince Leopold of Saxe-Cobourg (now king of the Belgians), to whom the Greek crown had been offered in 1829, mainly induced that prince to decline accepting it, which he did definitively on the 21st of May 1830. On the 9th of October of the following year, Capo d'Istria was assassinated at Napoli di Romania, on the threshold of a church, by George, the son, and Constantine, the brother, of Pietro Mauromichali, the old bey of Maina, whom he had detained for many months in prison without trial or even a specific accusation.

CARACALLA, or CARACALLUS, MARCUS AURELIUS ANTONINUS BASSIANUS, son of Septimius Severus, was born at Lyon while his father was governor of the provincia Lugdunensis. After Severus became emperor, Bassianus married Plautilla, daughter of Plautianus, the emperor's favourite. He accompanied Severus in his expedition to Britain, and was with him in the Caledonian war, on which occasion he is said to have conspired against his father, and even to have once drawn his sword to kill him. Severus forgave him, but his mind and health became so affected by the unnatural conduct of his son, that he soon after died at Eboracum (York), A.D. 211, leaving his two sons, Bassianus and Geta, his joint successors to the empire. Having concluded peace with the Caledonians, the two brothers returned to Rome, where Bassianus caused Geta to be murdered in the apartment, and in the very arms, of his mother Julia. Having bribed the Praetorian soldiers, by money and promises, to acknowledge him as sole emperor, he next put to death all the friends and attendants of Geta, and those who had shown any sorrow for his death, to the number of several thousands. The celebrated jurist Papinianus, the friend of Severus, was among the victims. Bassianus gave himself up to the company of buffoons, comedians, gladiators, and eunuchs, to whom he was prodigal of the public money, and many of whom he raised to high offices. In order to obtain money for his extravagance he deteriorated the public coin, and forced base money into circulation. During a visit to Gaul he put to death the proconsul of the provincia Narbonensis, and many other persons on his arrival at Narbo. On his return to Rome he brought with him a great quantity of garments made after a Gaulish fashion, in the shape of a long tunic with a hood to it, and known by the name of Caracalla, which he obliged all those who came near his person to adopt. From this circumstance he derived the surname Caracallus. At Rome he built the magnificent thermae which are known by his name. In an expedition into Germany he fought with the Catti and the Alemanni, and after much slaughter purchased peace by paying them large sums of money. He seems to have been the first emperor who adopted this humiliating system, which in course of time proved fatal to Rome. In the following year he went into Dacia against the Getae, and thence he proceeded by Thracia into Asia Minor. Having arrived at Antioch, he invited the kings of Armenia and of Osroene to come to him, and then made them prisoners. He seized upon Osroene, and founded a colony at Edessa. Having understood that the people of Alexandria spoke freely of him, and had loudly disapproved of the murder of Geta, he visited that city under the pretence of sacrificing to Serapis, and ordered an indiscriminate massacre of the citizens, which lasted several days: the city he gave up to plunder. He afterwards invaded the territory of the Parthians, under the pretence that Artabanus their king had refused him the hand of his daughter. He took Arbela, and overran Media, the Parthians having withdrawn to the mountains beyond the Tigris to collect their forces. The following year while he was expecting to be attacked by them, a conspiracy was formed against his life by Macrinus, prefect of the praetorium. As the emperor was proceeding on horseback from Edessa to Carræ, having alighted from his horse on

the road, a soldier of the name of Julius Martialis stabbed him to death, in 217, after a reign of six years and two months. Macrinus was proclaimed emperor by the army. (Dion. 77, 78; Spartianus, and Herodian, lib. iv.)

Coin of Caracalla.

British Museum. Actual size. Bronze. Weight 296 grains.

Caracalla was one of the worst among the bad emperors of Rome his cruelty seems to have been mixed up with a degree of insanity, a frequent consequence of unlimited power being possessed by one individual of uncontrolled passions and no principles.

CARACCI, or CARRACCI, LODOVICO, AGOSTINO, and ANNIBALE, three of the first painters of Italy, kinsmen, fellow-students, and fellow-labourers, were natives of Bologna, and founders of the Bolognese School.

LODOVICO CARACCI was born in 1555, and was placed at an early age with Prospero Fontana to study painting. He made such slow progress that his master dissuaded him from the pursuit, upon which he left Fontana, and thenceforth studied the works only of the great masters, for which purpose he travelled to Venice (where he became acquainted with Tintoretto) and Parma. Returning to Bologna, he found his cousins Agostino and Annibale so well inclined to his profession—for which they had evinced an early taste by scribbling sketches in their school-books—that he persuaded their father, a respectable tailor, to leave their education to him.

AGOSTINO CARACCI, who was born in 1557, had been intended for one of the learned professions; but his inclination led him to seek employment with a goldsmith, whose business he attended to for a time. He learned engraving from Cornelius Cort, and attained to such excellence that many of his engravings are only distinguishable from his master's by the superiority of the drawing; his works in that style are highly valued. His cousin placed him with P. Fontana, and afterwards with Passerotti. He never practised painting however with any constancy, but indulged a versatile ingenuity in various pursuits connected with literature and the liberal arts, working at his easel by fits and starts.

ANNIBALE CARACCI was born about 1560. Lodovico, after instructing him in his art, retained him with himself. Annibale exhibited a perfect contrast to the phlegmatic calmness of Lodovico, to the accomplished fickleness of Agostino, and to the amiable mildness of both; he was rude and impatient in temper, though of so open and generous a nature that he is said to have kept his colours and his money in the same box, both of which were equally at the disposal of his scholars. He laboured in his vocation with an unwearied and enthusiastic devotion, and a singleness of purpose which has never been excelled, scarcely perhaps equalled. He disliked all study but that of painting, and more than once burst out into complaints against the school-like refinements and the slow proceedings of his kinsmen in their pursuit of excellence. Like Lodovico, he travelled about from place to place, improving himself by all that he saw, and aiming to combine in his own works the excellences of the great works that he studied. The three opened an academy in Lodovico's studio, which became famous for the illustrious pupils whom it sent forth.

The fame of the Caracci reaching Rome, Annibale was invited by the Cardinal Odoardo Farnese to adorn his palace with paintings. He went, accompanied by Agostino; and the two brothers were delighted and exalted by the sight of the ancient works of art, and the labours of Michel Angelo and the divine Raffaello. The usual dissensions however arose, and Annibale's intolerant devotion to labour drove away his more festive brother. The Farnese Gallery occupied Annibale for eight years, for which he is said to have received only five hundred crowns—a meanness of remuneration, as Lanzi justly observes, almost incredible. He did little after this, and died in 1609. He was buried, according to his own desire, by the side of Raffaello. Agostino died in 1602. Lodovico lived until 1619.

The works of the three kinsmen are principally in Bologna and Rome. The Farnese Gallery is considered the greatest work of Annibale. The Louvre contains the 'St. John the Baptist' by Lodovico, and the 'Communion of St. Jerome' by Agostino, which are respectively reckoned their best works in oil. Our own National Gallery contains several paintings and two cartoons by the Caracci, but none perhaps that can be reckoned among their finest works. (Malvasia.)

CARACCIOLI. [NELSON, LORD.]

CARA'TACUS. [BRITANNIA, in GEOG. DIV.]

CARA'FFA, a distinguished Neapolitan family, divided into many branches, all descended from Filippo Caraffa, lord of Spinalonga, who

died in 1220. The princes of La Rocca, Sanseverino, and Belvedere, and the dukes of Melfi, Mondragone, and Andria, are all branches of the Caracci family. There have been in the family one pope (Paul IV.), many cardinals, archbishops, and bishops, one grand master of the Order of Malta, &c.

CARAGLIO, GIANGIACOMO, a very celebrated old copper-plate, metal, and gem-engraver, born at Verona or at Parma about the commencement of the 16th century. He was the pupil of Marcantonio at Rome, and is one of the best of the early Italian engravers. His prints are rather numerous, though their number has not been accurately ascertained. Bartsch describes sixty-four; and Brulliot knew only of sixty-five. In the latter part of his life Caraglio gave up engraving on copper, and confined himself to metal, cameo, and gem engraving, an art in which he obtained so great a reputation, says Vasari, that Sigismund I., king of Poland, invited him to Warsaw to execute some works for him. He returned to Italy well rewarded, and died about 1570, at his own estate in the neighbourhood of Parma. The fact of his settling in the Parmesan territory is in favour of the supposition that Parma was his native place; he signs himself 'Parmensis' on several of his works, yet more are signed 'Jo. Jacobus Veronensis;' some 'Jas. Caraglio.'

He engraved after Il Rosso, Raffaello, Titian, Michel Angelo, P. del Vaga, Julio Romano, Parmegiano, and other famous masters. His heads are well executed, as is the nude generally, but the draperies are hard and unnatural: his lines are distinct, and show great mastery for the period, but he did not reach the excellence of his master Marcantonio.

(Vasari, *Vite de' Pittori*, &c.; Bartsch, *Peintre-Graveur*; Brulliot, *Dictionnaire des Monogrammes*, &c.)

CARAVAGGIO, MICHELANGELO, AMERIGHI, or MORIGI, called DA CARAVAGGIO, from a town of that name in the Milanese, in which he was born about the year 1569. His father worked at Milan as a labouring builder. The son derived his first love of the art, together with such knowledge as he could pick up, in the service of certain artists as a colour-grinder. In course of time he managed to go to Venice, where he studied the works of Giorgione with great success, and some of his pictures in the style of that period are much esteemed.

Caravaggio afterwards went to Rome, where, finding difficulty in getting employment, he engaged with a trafficking artist, called Arpino, for whom he principally painted flowers and fruit. This man he soon quitted, and commenced painting in the miscellaneous style which he ever after pursued. He made a resolution to study no more from artificial models, but to adhere simply to nature, such as he found it in the streets and alleys of Rome. Neglecting his early studies at Venice, he assumed a manner characterised by dark and gloomy shades, illuminated by a scanty twilight, as if he painted in a cellar. Having quarrelled over some game with a companion, whom he killed, he fled to Naples; from Naples he went to Malta, where he was made a knight; but here too he quarrelled with a person of rank, and was thrown into prison. Though he made his escape to Sicily, vengeance pursued him, and he was assaulted by a party of armed men, and grievously wounded and disfigured. His friends having obtained a pardon from the pope for the murder, he set out for Rome, but unfortunately, on landing, he was taken into custody by mistake, and upon being released, could no longer find the vessel, which had all his property on board. Exhausted with fruitless endeavours to find the vessel and his property, he endeavoured to make the best of his way to Rome. The heat, his yet unhealed wounds, and anxiety of mind, brought on so violent a fever, that he could barely reach the Porta Arde, where he sat down upon a bank and presently expired, at the age of forty, in the year 1609. Caravaggio was rude and negligent in his person and habits; he scarcely retained a friend, and he deduced all rules of civility and decency.

The principal merit of his pictures consists in the colouring, which is pure and vigorous; the tints are few, but true to nature. Annibale Carnot said of him that he "ground flesh" (and not colour). The obscurity in which he involves his design gives it a certain air of mysterious grandeur; but his figures are replete with the unrefined vigour of the models from which he studied, and the extravagance of a self-taught conceit aggravated by abandoned habits. His principal works are a 'St. Sebastian,' in the Capitol at Rome, a 'Supper at Emmaus,' in the Borghese Palace, and the 'Entombment of Christ,' now in the Louvre, which in its original place in the Chiesa Nuova was considered to eclipse the rival altar-piece by Barocci, Guido, and Rubens.

Among the number of his imitators, says Lanzi, there is not a single bad colourist; Guercino and Guido, and even Annibale Caracci, are said to have profited by the study of his works. (Baldimori.)

CAHAVA'GGIO, POLIDORO DA, a celebrated Italian painter, born at Caravaggio about 1495; his family name was CALDARA. When he was eighteen years of age he was a labourer, and was with many others employed as such about 1512 in the Vatican, when Raffaello was painting the loggia and stanze there, in the pontificate of Leo X. He appears to have taken great interest in the progress of the works, and he made some attempts at design himself, which had sufficient merit to induce Maturino of Florence, one of the assistants employed, to undertake to teach him to draw, for which he soon displayed extraordinary ability. A strong attachment grew up between

the two young painters. Maturino employed Polidoro to assist him in his work, and their joint labour soon attracted the notice and admiration of Raffaello.

Vasari evidently gives the greater merit in these early works to Polidoro, but as the later works which he painted when alone, were very different in style from these and others which were done in Rome in this period, in company with Maturino, some recent writers have ventured to give Maturino the greater credit. These works were in fresco and in light and shade, or what the Italians call chiaroscuro, and consist mostly of friezes and other decorations, in imitation of bronze or marble, applicable for buildings, interiors or exteriors. Their figures, of which they were not sparing, were drawn in a pure antique style, and not inferior in that respect to the works of any modern master. They imitated ancient statues and bassi-relievi, and ancient sculptured ornaments of any kind. Vasari says that there was not a fragment of ancient ornamental art in Rome which they did not copy; they painted also original works from sacred and modern story. Of all these works however scarcely a vestige remains, but some are in a measure preserved by the prints of Cherubino Alberti, P. S. Bartoli, and Galestruzzi. The last engraved, in five sheets, the story of Niobe, which Maturino and Caravaggio painted as a frieze on the facade of a house opposite the Palazzo Lancellotti: it was one of their masterpieces.

The sack of Rome, by the soldiers of Bourbon in 1527, put an end to the joint labours of Polidoro and Maturino; they both fled, but Maturino is supposed to have returned, and to have died of the plague in the same year. Polidoro went to Naples, where he was received into the house of Andrea da Salerno: he practised there some time, but finding that his works were not duly appreciated, he removed to Messina. Here, in 1536, upon the visit of Charles V., on his return from his victorious expedition to Tunis, he was intrusted with the conduct of the triumphal decorations on the occasion. He dwelt several years in Messina in high esteem, and executed many good works, not in the early style of chiaroscuro, but in colours; and some of them were for altar-pieces: Vasari mentions a 'Christ led to Calvary' amidst a crowd of people, as a masterpiece. In 1543 he made up his mind to return to Rome, having, to his misfortune, as it proved, amassed a considerable sum of money. Polidoro had provided himself with a large sum of money, and all things were prepared for his departure the ensuing morning. A servant whom he had had many years to accompany him; but the wretch hired some assassins to strangle him during the night, when he was asleep, agreeing to share the booty with the assassins, who having stabbed the body of Polidoro in two or three places, carried it to the door of a house where a lady lived whom he had been in the habit of visiting. The servant went weeping and lamenting, and related the discovery of the body to a certain count, a friend of Polidoro's, but he eventually suspected the truth of the man's story, and caused him to be put to the rack, upon which he made a circumstantial confession of the whole infamous affair. The miserable creature was tortured with heated feroops, hanged, and quartered. Polidoro was buried in the cathedral of Messina. Some of the pictures which he painted at Messina are in the Gallery of Naples. He excelled in landscape. He also etched several plates in a good style; they are however extremely scarce: the prints after him are likewise scarce.

(Vasari, *Vite de' Pittori*, &c.; Gandellini, *Notizie Storiche*, &c.; Lanzi, *Storia Pittorica*, &c.)

CARBO, CNEIUS PAPIRIUS, son of Carbo the Roman orator. (Cic. 'De Clar. Orat.' 27. 33, &c.) He espoused the party of Marius, and was consul three times; A.U.C. 669 he was colleague with Cinna. Cinna had the administration of Italy, while Carbo took the command in Gaul. When Cinna died Carbo remained sole consul, and opposed Sulla in Italy. He procured from the senate and people a decree declaring all who joined the cause of Sulla enemies to the state. Carbo was afterwards defeated by Pompey, and was at last taken prisoner in Sicily, and brought before his tribunal. Pompey pronounced a violent invective upon him, and ordered him to be led to execution. A.U.C. 671. (Appian, 'De Bell. Civ.' vol. i. p. 410.) The ingratitude of Pompey in thus treating a man who had so ably defended him in his youth, when his father's property was going to be confiscated, has been deservedly condemned by Valerius Maximus (v. 3. 5.)

CARDAN, JEROME. To give any great detail of the life and writings of this singular union of genius and folly would require considerable space. We must therefore confine ourselves for the most part to those circumstances in regard to which his name is principally mentioned in modern writings.

On the life of Cardan the authorities most in use are—1. His own treatise 'De Vita Propria,' Works, vol. i.—2. G. Naudæus 'Judicium de Cardano,' 1643. The most accessible accounts of these are in 'Bayle's Dictionary,' article 'Cardan;' and in Teissier, 'Eloges des Hommes Savans,' vol. iv. p. 97.

The works of Cardan were collected under the title of 'Hieronymi Cardani Opera omnia, curâ Caroli Sponii,' Lyon, 1663, in ten volumes, folio. The following list of works, long as it may appear, is perhaps the shortest mode of touching on many points which require only two briefest notices. In all, the date begins the title.

1539, 'Card. Casilionei Practica Arithmetica,' &c., Milan.—1541, 'Aphorismi astronomici,' Ulm.—1542, 'De consolatione,' Venice.—

1544, 'De Judiciis Geniturarum exemplis illustratum,' Nuremberg.—1545, 'Ars Magna,' &c., Nuremberg.—1545, 'De Malo recent. Medica medendi usu,' Venice.—1545, 'De Animi Immortalitate,' Venice.—1547, 'De Supplemento Almanach,' Nuremberg.—1547, 'De Genituris, Revolutionibus,' &c., Nuremberg.—1550, 'De Rerum Subtilitate,' Nuremberg (again in 1557).—1553, 'An Bala. Articuli Morbo Competat,' Venice.—1554, 'In quadripart. Cl. Ptolemaei. Ejusdum Geniturarum xii,' Basel.—1557, 'De Rerum Varietate,' lib. xvii., folio, Basel.—1559, 'In Hippocratem de Aere,' &c. Oratio de Medic. Inscitia,' Basel.—1559, 'Opusc. Artem Med. exercent. utilissima,' Basel.—1561, 'De Utilitate ex Rebus Adversis capiendâ,' Basel.—1562, 'H. Card. Somniorum Synesiorum,' libri iv., Basel.—1563, 'De Providentiâ ex Anni Constitutione,' Bologna.—1564, 'Comm. in vii Particulas Aphorism. Hippocratis,' Basel.—1564, 'Ars Curandi parva,' Basel.—1565, 'De Simpl. Medicament. Noxâ,' Paris.—1565, 'De Methodo Medendi,' Paris.—1566, 'Anti-Gorgias,' Basel.—1570, 'H. Card. &c. de Proportionibus Numerorum Motuum, &c. . . . Preterea Artis Magnæ sive de Regulis Algebrae, liber unus, &c. . . . Item de Alizâ Regula liber,' Basel.—1573, 'Examen 22 Aegrotorum Hippocratis,' Rome.

We have chosen this list as containing all we can certainly ascertain to have been published during his lifetime. We have found the dates mostly in old catalogues, and it is very possible that several may be reprints. The list of his works is of considerable length; but many were not published until after his death; and some not till the collection in ten volumes, already mentioned, was made. He states of himself that he had printed 128 books, had written 40 more, and that 60 authors had cited him.

Jerome Cardan was born at Pavia in the autumn of 1501; his father was a physician and lawyer at Milan. From two circumstances mentioned by himself, namely, that his mother and father did not live together, and also that the former endeavoured to procure a miscarriage, it is presumed that he was illegitimate. At twenty years of age he studied in the university of Pavia; at twenty-two he taught Euclid in the same place. He went to Padua in 1524, and was there received doctor in medicine in 1525. He was successively professor of mathematics or of medicine at Milan, Pavia, or Bologna, and was imprisoned in the latter place (but for what offence is not stated) in 1570. Having obtained his liberty, he left Bologna in September 1571, and went to Rome, where he was admitted into the college of physicians, and received a pension from pope Pius V. He died after Oct. 1, 1576, and probably not long after, but when is not well known. He was unfortunate in his family, which consisted of two sons and a daughter. The elder poisoned his wife, and died by the hands of the law; Cardan protested against the sentence, and rested his son's justification upon the conduct of the wife, who, he affirms, had made his son believe that she was a woman of good fame and fortune, being neither. It is an evidence of the extreme vanity of his character, that not denying the fact for which his son suffered, he left on record his belief that the judges, in passing the sentence, had no other object than to deprive him of life or reason. The younger son turned out badly, and was disinherited by his father. His daughter, according to his own account, never caused him any other vexation than the payment of her marriage portion. The treatise 'De Utilitate,' &c. was written on the death of his eldest son.

If Cardan had left nothing but writings on astrology, mathematics, medicine, or morals, he would have passed among the rest as an eccentric genius, with a full share of all the folly and mysticism which pervaded the philosophy of his day. It is to his own account of himself that we are indebted for the quantity of description and speculation relative to his personal character which is found in all biographies. There may be in this production a touch of the insanity which delights in accusing itself of crimes, or in exaggerating its foibles: as it is, and taking the character of Cardan as he has given it himself, we see a man—of unequalled self-conceit, as when he says his book of logic (written in seven days, but hardly to be understood by any one else in a year) has not a letter either of omission or superfluity; and that he is born to deliver the world from a multitude of errors: of little benevolence, as when he avows that his greatest delight in conversation is to say things which he knows will be disagreeable to his hearers: of no veracity, as witness his assertion that he acquired a perfect knowledge of Greek, Latin, French, and Spanish in twenty-four hours from an edition of Apuleius: of violent temper, instanced by his striking one in the face with a dagger whom he discovered to be cheating him at play: and of little honesty, as evidenced by his justification of his refusal to return a pledge, namely, that it was deposited in presence of no witness. He was also a superstitious free-thinker; attached to his religion, but disposed to treat it in his own way, to an extent which made a worthy divine who claimed, we suppose, to be the adjunct-general of heretics, call him the "chief of the hidden Atheists of the second class." His refusal to accept an advantageous settlement in Denmark, on condition of apostatising, ought to establish his right to some principle. His four gifts—1. the power of throwing his soul out of his body (for his words can mean nothing less)—2. his faculty of seeing whatever he pleased with his eyes, 'oculis, non vi mentis'—3. his dreams, which uniformly and on every occasion foretold what was to happen to him; and 4. his finger nails, which did the same thing; to say nothing of his astrology, his good demon,

&c., &c.—establish his claim to be the chief of the visionaries "of the first class." Bayle has drawn the distinction between him and other men of equal talent with some point: he says that "nullum magnum ingenium sine mixturâ dementiæ" is not a maxim which includes Cardan; for that with him the folly is improved by talent, not the talent adulterated by folly.

It would hardly have been worth while to have entered into the preceding detail, if Cardan had been a common man. As a physician, his reputation extended through Europe, both as a practitioner and a writer. In 1552 he went to Scotland to the assistance of Hamilton, archbishop of St. Andrews, whom he cured: in the memoirs of Melvill the fact is stated, and Cardan is mentioned by name, with the addition that he was an Italian magician. His medical writings have procured him no lasting reputation: those who follow such pursuits seem to have tacitly consented that Cardan shall be left to the mathematicians; and it is to his discoveries in algebra that he must be considered as entitled to a prominent place in biography. Before proceeding to consider him in this character, we shall only state that De Thou, who knew him personally, and records that he always dressed in a different manner from the rest of the world, says that it was commonly believed his end arose from starvation, voluntarily undergone, that he might not outlive the time which he had predicted for his own death. This story has been frequently copied, as if the fact had been positively asserted by the historian, whereas he only speaks of a rumour.

The 'Ars Magna,' published in 1545, contains the extensions which Cardan made in the solution of equations. Algebra was then an art contained not in formulæ but in rules, and extended no further than the methods of solving numerical equations of the second degree. We shall not here enter into the celebrated dispute between Cardan and Tartaglia, further than to specify the part taken by the former. When he was informed of the solution of cubic equations which Tartaglia had discovered, he applied to the latter, March 25, 1539, and requested he would communicate his method, which Tartaglia declined, intending to reserve the same for the work which he published afterwards in 1554. Cardan then swore "upon the Holy Gospels, and the faith of a gentleman," that he would not only not divulge the secret, but would engage to write it in such a cipher as no one should be able to read in case of his death. Tartaglia, upon this assurance, communicated his method. This detail rests upon the authority of Tartaglia himself ('Quæsitæ et Inventioni,' folio, 120), but is amply confirmed by Cardan's subsequent letters, and was never denied by him. Notwithstanding his word thus pledged Cardan published these methods in his 'Ars Magna' (1545), giving the credit of them indeed to Tartaglia, but concealing the promise he had made.

The communication made to Cardan amounted to the solution, without demonstration, of $x^3 + ax + b = 0$, in the cases where a and b are, one or both, negative. Cardan himself supplied the demonstrations, showed how to reduce all equations of the third degree to the preceding form, and how to extract the cube root of the binomial surd quantities which the well-known solution involves. He may be said to have arrived, in detached and isolated theorems, at as much, relative to equations of the third degree, as could afterwards be established, in the time of Des Cartes, for equations of all degrees. He was the first who considered negative roots, and comprehended the nature of the connection between them and the positive roots of other equations; and he even gave the first idea of a method of approximation.

The algebra of Cardan, owing to the want of general symbols, is difficult to read; and Montucla, biassed perhaps in favour of his countryman Vieta, has somewhat underrated his merits. On the other hand we have Cosali ('Origine, &c., dell' Algebra,' Parma, 1797), whose object it seems to be to discover something like modern and symbolic analysis in the obscure and verbal rules of the Italians of the 16th century. If this learned and estimable writer be considered as holding a brief for Tartaglia, Cardan, and Bombelli, his work may be highly useful. For instance, when he shows, by collecting the various cases propounded by Cardan, that the latter had all the elements which if put together would have been the celebrated rule of signs of Descartes, and thence affirms that Cardan was in possession of that rule so far as equations of the third degree were concerned, he forgets that Cardan neither did nor could put those elements together. And when he attributes a symbolic (or, as it was technically called, a specious) notation to Cardan, because the latter sometimes uses a letter to stand for a number in his general enunciations, he does not remember that Euclid has a prior claim, if in that circumstance merely consists the leading feature of the method of Vieta.

There is in the algebra of Cardan considerable power of developing the details of his subject, and of explaining the modifications presented by solutions, but not much inventive sagacity. He states himself that he was originally prevented from attempting the solution of cubic equations by the simple assertion of Lucas di Borgo, in his work on algebra, that the solution was impossible; though Cosali has shown that, had he even read that author with attention, he would have seen that the assertion was not meant to apply to more than algebra as it then existed. In the case of biquadratic equations he attempted nothing himself, but requested his pupil, Ludovico Ferrari, to undertake the investigation, who accordingly produced the reduction now known by his name, and which was published by Cardan. But if we take the whole extent of the 'Ars Magna,' it is sufficiently obvious that

Cardan would have been an analyst of considerable power if he had lived after Vieta.

There is in the second volume of Dr. Hutton's 'Tracts' an account of the 'Are Magna,' the most complete of which we know in English.

CARDI, LUDOVICO. (Died.)

CARDUCCIO, the name of two very able Florentine painters, brothers, who settled and chiefly resided in Spain, where, agreeably to Spanish orthography, they wrote their name Carducho.

BARTOLOMEO CARDUCHIO, the elder brother, was born in 1560. He practised as a painter, sculptor, and architect, and was the scholar of Federico Zuccaro, whom both brothers accompanied into Spain in 1585, where they attained great distinction in the service of the kings Philip II., Philip III., and Philip IV. Bartolomeo was equally excellent in fresco and in oil, and there are still some of his works extant in Spain. He drew in the style of the antique, and with great exactness; he excelled also in composition, in expression, and in colour. There is a 'Deposition from the Cross' by him in a chapel of San Felipe el Real at Madrid, which Cumberland says may well be taken for one of Raphael's. His principal works were the frescoes he painted in the Escorial; he painted also works at Segovia, Valladolid, and Miranda; and, according to Ceán Bermúdez, few Italian artists did so much for the arts in Spain as Bartolomeo Carducho. He died at Madrid in 1608, having served the Philips II. and III. for twenty-three years. Philip III., who had appointed him his painter, granted a pension to his widow, and to his two daughters, both of whom were born in Madrid.

VINCENZO CARDUCHIO was born in 1568, was the scholar of his brother, and succeeded him as painter to Philip III. in 1609. His services in the advancement of the arts in Spain were even greater than those of his brother, though in the technicalities of art he was a less able painter. He however educated a numerous school, and in 1633 published a book of dialogues on painting, in Spanish, 'Dialogos sobre la Pintura,' &c., which, says Bermúdez (1800), is the best work in the Castilian language on the subject. He died in 1636. There are many of his works at Madrid, and some at Valencia, Toledo, Salamanca, and Valladolid, but his greatest work is the series of paintings from the life of Saint Bruno and other saints, in the Carthusian convent of Paular, commenced in 1626 and finished in 1630.

(Ceán Bermúdez, *Diccionario Historico, &c.*; Cumberland, *Anecdotes of Eminent Painters in Spain*.)

CAREW, THOMAS, born in 1589, of a good family in Gloucestershire, was educated at Oxford, and attached himself to the court of Charles I., at which he held several easy offices. He died in 1639, leaving a volume of small poems (1640, 8vo), besides scattered pieces never yet wholly collected, and a masque, 'Cœlum Britannicum,' 4to, 1634. Carew's poems are light and airy effusions, chiefly lyrical, and all dealing with topics of a trifling kind. But their merit in their own kind is great. Thomas Campbell pronounces him to be pre-eminently beautiful among poets of his class; and Mr. Hallam hesitates in determining the preference between him and Waller, to whom he holds Carew superior both in fancy and in tenderness, though inferior in judgment and in care of execution. Two of the best poems in his volume appear also among the pieces of Herrick.

CAREY, HENRY, said to be an illegitimate son of George Saville, marquis of Halifax, was born towards the end of the 17th century. He was professionally a musician in London, but attained no great success in his art, although he composed both the words and the music of several songs. One of these was the popular song of 'Sally in our Alley.' He wrote several farces and musical pieces for the stage; among which were 'Chronobolothologos,' 1734, and 'The Dream of Wantley,' 1737. His pecuniary affairs were repeatedly much embarrassed; and, in a fit of despondency, owing perhaps to this cause, he put an end to his own existence in 1743.

CARINUS, MARCUS AURELIUS, succeeded to the throne conjointly with his brother Numerianus, after the death of their father Carus at the beginning of A.D. 284. His conduct at Rome during the absence of his father had been marked by licentiousness, cruelty, and extravagance. His brother Numerianus, whose character was good and mild, having been murdered by Aper on his return from Persia, the soldiers elected Diocletian, a soldier of fortune, who immediately put Aper to death. Diocletian then marched against Carinus. Carinus collected the troops that were in Italy, and went to meet Diocletian. The two armies met in the plains of Moesia, near Margum and Viminium. Carinus had at first the advantage; but many of his own officers, who detested him for his brutal conduct, rose against him, and killed him during the action. The two armies then ceased the fight, and proclaimed Diocletian sole emperor, A.D. 285.

Coin of Carinus.

British Museum. Actual size. Silver. Weight 25 grains.

*CARLÉN, EMILIE, a Swedish novel-writer, whose works are much read in England, appears to be partly of English parentage, as the name of her father is stated in the 'Svenskt Konversations-Lexikon' to have been Roger Smith. He was a merchant at Strömstad, a small sea-port and fishing-town in the province of Bohuslän, close to the Norwegian frontier, where his daughter was born on the 8th of August 1807. In her childhood she often accompanied him on his voyages, and a familiarity with the sea and seamen, very unusual in a lady novelist, is a conspicuous feature in many of her writings. In 1827 she was married to a medical man of the name of Flygare, was left a widow in 1833, and in 1841 was united to her present husband, Mr. Carlén, a lawyer residing at Stockholm. Hence, in those of her writings to which her name appears, she is generally designated Emilie Flygare Carlén. Her first novel, 'Waldemar Klein,' was published anonymously in 1833, when she was living a widow at Strömstad; it was so successful that in 1839 she removed to Stockholm, and the 'Svensk Bokhandels-Katalog' contains a list of fourteen novels which issued from her pen up to the time of its publication in 1848. This activity is still continued. The first of her novels which appeared in an English dress was the 'The Rose of Tisteln,' that is, 'The Rose of Thistle-Island,' in 1844. It became at once popular among novel readers, and not a season has since passed without one or more translations from Emilie Carlén. Even the following is perhaps not a complete list:—'The Birthright'; 'Gustavus Lindorm'; 'The Hermit'; 'The Events of a Year' (also translated under the title 'Twelve Months of Matrimony'); 'The Lover's Stratagem'; 'The Maiden's Tower'; 'Marie Louise'; 'Woman's Life'; 'The Temptations of Wealth'; 'A Brilliant Marriage'; 'The Professor' (also translated under the title of 'The Professor and his Friends'); 'Ivar the Skjute-Boy'; 'Julie, or Love and Duty'; 'John, or a Cousin in the Hand worth Two Counts in the Bush.' The whole of the translations first published in England are manifestly made not from the originals, but from German versions; they are however in general very well executed. Some of those which have been first published in America, where Madame Carlén is no less popular than in England, have been made from the Swedish by Swedes, and bear marks of a foreign hand. All her writings have the recommendation of being very readable, and the novel-fancier who has commenced one of her stories can seldom lay it down without proceeding to the end. They are however not of a kind which invite to a re-perusal, a considerable portion of the interest lying in the incident, and very little in the delineation of character or strength of description. On the other hand, there is in the tales of Madame Carlén none of the exaggerated sensibility which sometimes offends in those of Miss Bremer, the only other Swedish novelist who has found acceptance with the English and American public. Indeed the moral perceptions of Madame Carlén do not appear in her writings to be over acute; the chief lesson that can be said to be inculcated in the 'Rose of Tisteln,' perhaps the best told of her stories, is, that after a certain time has elapsed, the discovery of the perpetrator of a murder is an extremely inconvenient occurrence, and to be avoided if possible. The scene of her narratives is invariably laid in Sweden, which gives them to a foreign reader the additional charm of introducing him to a country and state of society which, till lately, had never been delineated in a popular work of fiction. The critics of her native country find fault with her for writing too much, and in fact by her rapidity of production she scarcely seems to allow fair play to the powers she undoubtedly possesses. If she were to reserve the right of translating her works in England, she would secure an income far beyond any that has ever been derived from the profits of a Swedish copyright.

CARLI, GIAN RINALDO, was born in April 1720, of a noble family at Capo d'Istria, in the Venetian territory. He studied first at home, and afterwards at Fiambro in the Friuli, where he applied especially to the mathematical sciences. At the age of twenty-four he was appointed by the Venetian senate professor of a new chair of astronomy and navigation established at Padua. He invented several improvements in ship-building for the Venetian navy, and had the superintendence of the naval school at Venice. After seven years he resigned his chair and returned to Istria, to attend to the management of his private affairs. During this time he visited the antiquities of Pola, which he afterwards detailed at length in his work on Italian antiquities. He had for a companion in his researches the naturalist Vitaliano Donati, whose work on the natural history of the Adriatic was edited by Carli after the author's death: 'Saggio della Storia Naturale Marina dell' Adriatico,' 4to, Venezia, 1750. In 1754 Carli published the first volume of his great work, 'Delle Monete e della Istituzione delle Zecche d' Italia.' ('On the History of the Coins and Currency, and on the Institution of the Mints of Italy.') The second volume appeared in 1757, and the third and fourth in 1760. Carli employed nine years in the compilation of this work, during which he inspected the cabinets of medals and the archives of Milan, Turin, Tuscany, &c. A new edition, with corrections and additions by the author, was published at Milan in 1785, in 7 vols. 4to. Carli begins the monetary history of Italy with the mint of Odoacer at Ravenna, after the fall of the Western Empire, and comes down as far as the 17th century, describing and illustrating the numerous coins, national and foreign, which were current in Italy during the intervening ages; their weight, title, legends, and relative value, and also their value

compared with the price of provisions at different epochs. He treats also of the commerce of bullion, and of the frequent alterations and deteriorations which took place in the weight and intrinsic value of the currency: he considers the whole subject both in its economical and legal aspect.

Carli was appointed president of the new council of commerce and public economy established at Milan as well as of the board of public studies. In these capacities he repaired to Vienna in 1765 to confer with the minister Kaunitz, and was received at court with great distinction. When Joseph II. went to Milan in 1769 he appointed Carli his privy-councillor, and it was at Carli's suggestion that the emperor finally abolished the tribunal of the Inquisition, which had existed at Milan for centuries. In 1771 Carli was made president of the new council of finances, which made useful reforms in that branch of administration. His labours having seriously impaired his health, he resigned the presidency of the council of commerce, and devoted his time chiefly to complete his '*Antichità Italiane*,' which appeared in 1788, 5 vols. 4to. Notwithstanding its general name the work is chiefly engrossed by the antiquities of Istria. Carli being now old and infirm, the emperor Leopold II. restored to him the whole of the emoluments which he had enjoyed when in the full exercise of his office. He lived some years longer, and died in February 1795, leaving behind him the reputation of an enlightened economist, a learned archaeologist, and a virtuous magistrate. He published many other works, among which are '*Ragionamento sopra i Bilanci economici delle Nazioni*,' in which Carli asserted, against the then received opinion of the economists, that the balance of trade between nation and nation proved little or nothing as to the real prosperity of each; '*Sul libero Commercio dei Grani*,' addressed to Pompeo Nero in 1771, in which he combated the general application of the principle of the freedom of the corn trade under all circumstances; '*Relazione sul Consumo dello Stato di Milano*;' '*Lettere Americane*,' in which he investigates the antiquities of America. In his '*L'Uomo Libero*, ossia Ragionamento sulla Libertà Naturale e Civile dell' Uomo,' he combats Rousseau's theory of natural liberty: this is perhaps the best refutation of the '*Contrat Social*.' He wrote also '*Saggio sulla Toscana*,' '*Della Patria degli Italiani*,' '*Indole del Teatro Tragico*,' besides many dissertations on classical subjects, on the triremes, on the Argonauts, on Hesiod's Theogony, on the geography of the ancients, &c. He likewise wrote a defence of Paolo Vergerio, bishop of Capo d'Istria, who was condemned as a heretic by Pope Paul III.; a refutation of Tartarotti, who even in Carli's time asserted the existence of sorcery; several poetical compositions, and a letter on the gout, in which he describes a new remedy which he had discovered for that disease. Carli's works were published in 19 vols. 8vo, Milan, 1784-94, exclusive of his '*Italian Antiquities*.' He left also many works in manuscript.

CARLISLE, SIR ANTHONY, surgeon, was born near Durham, in the year 1768. He commenced his professional education with an uncle at York, and thence he was transferred to Durham, where he remained for some time under the instruction of Mr. Green, the founder of the hospital in that city. Having finished his preparatory studies he repaired to London, and attended the lectures of the Hunters, Dr. Baillie, and Mr. Cruikshank. He was at the same time pupil to Mr. Watson, then surgeon to the Westminster Hospital. On the death of Mr. Watson in 1793, Mr. Carlisle was appointed his successor. He became a member of the College of Surgeons, and was early appointed one of the council of that body. He was for many years on the Board of Examiners, and one of the curators of the Hunterian Museum. He also held the appointment of Professor of Surgery and Anatomy, and in 1820 he filled the office of President. He was appointed Surgeon Extraordinary to George IV., when he was Prince Regent, and was knighted by him at the first levée he held as king. He was also surgeon to the late Duke of Gloucester, to whom he was introduced by the learned Dr. Samuel Parr. In 1808, on the death of Mr. Sheldon, he was appointed Professor of Anatomy to the Royal Academy, an office he held for sixteen years.

Sir Anthony Carlisle owed his position to the activity and industry with which he pursued the various departments of science connected with his profession. His early acquaintance with John Hunter gave him a taste for comparative anatomy, which he pursued with much ardour, and many of his earlier literary productions were on this subject. One of his first papers was '*A Case of an unusual Formation in a part of the Brain*,' which was printed in the '*Transactions*' of a '*Society for the Improvement of Medical and Surgical Knowledge*' in 1793. To the second volume of the '*Transactions of the Linnæan Society*,' published in 1794, he contributed a paper entitled '*Observations upon the Structure and Economy of those Intestinal Worms called Tæniæ*.' In 1800 he was admitted a Fellow of the Royal Society, and contributed a paper to the '*Philosophical Transactions*' of that year, entitled '*An Account of a peculiar Arrangement in the Arteries distributed on the Muscles of slow-moving Animals*.' There are several other anatomical and physiological papers by him in the '*Philosophical Transactions*': '*An Account of a monstrous Lamb*, 1801; '*The Physiology of the Stapes*, 1805; '*Account of a Family having hands and feet with supernumerary fingers and toes*, 1814. After the paper on the distribution of the blood-vessels in the slow-moving animals, his attention was directed to the connection between

the circulation of the blood and the action of the muscles, and in 1804 he gave the Croonian lecture on '*Muscular Motion*.'

To medical literature more especially Sir Anthony made many contributions. One of the first was '*On the Nature of Corns and the mode of removing them*,' published in Simmons's '*Medical Facts and Observations*,' 1797; '*A New Method of applying the Tourniquet*' ('*Lond. Med. and Phys. Journal*'), 1797; '*On the general and indiscriminate use of Bougies*,' *Ibid.* 1800; '*Letter to Sir Gilbert Blane on Blisters, Rubefacients, and Escharotics*, giving an account of the employment of an instrument adapted to transmit a defined degree of heat to effect those several purposes,' London, 1826. In 1817 he published a larger work entitled '*Essay on the Disorders of Old Age and the means of prolonging Human Life*,' 4to, London; a second edition was published in 8vo in 1818. In 1829 Sir Anthony published '*An Alleged Discovery of the Use of the Spleen and Thyroid Gland*.'

During his connection with the College of Surgeons he delivered two of the Hunterian orations—one in 1820 and one in 1826. The first was on the constitution of organised bodies, and the second on the connection between vascular and extra-vascular parts. One of his last papers on medical subjects was published in the '*London Medical Gazette*' in 1828, '*On Erysipelas*.' He died in London, on the 2nd of November 1840.

He published numerous other papers: two on plants, in the '*Horticultural Transactions*;' two on antiquities, in the '*Archæologia*;' on the breeding of eels, and the health of workmen in sewers, in the '*Philosophical Magazine*;' on the decomposition of eggs, in '*Nicholson's Journal*;' and on cathartics, the bite of vipers, the venereal disease, &c., in the '*New Medical and Physical Journal*.' One of the most remarkable of his papers on general subjects was one on '*Galvanic Electricity*,' in '*Nicholson's Journal*,' in which he first pointed out the fact that water might be decomposed by the galvanic battery. He was also a frequent contributor to the newspapers, and letters of his appeared in the '*Times*' on the salt-duties, the importance of salt to the health of human beings, military flogging, hygeian quackery, man-midwifery, &c.

CARLOS, DON. [PHILIP II.]

CARLOS, DON (Count de Molina), Infante of Spain, and pretender to the Spanish throne, was the second son of Carlos IV. of Spain, and was born on the 29th of March 1788. Left chiefly in the hands of priests, to whom the superintendence of his education had been entrusted, Don Carlos remained in comparative obscurity during the domination of Godoy. On the first abdication of his father and the accession of his brother Ferdinand VII., Don Carlos was sent to meet Bonaparte, who had announced his intention to visit Spain. The young prince was inveigled beyond the French provinces, and made in effect a prisoner, and Ferdinand, like his brother, soon found himself also in the hands of the French. Bonaparte next compelled the weak ex-monarch of Spain to proceed to Bayonne, and refusing to acknowledge his former abdication, forced him first to resume the crown, and then, for himself and his posterity, to "abdicate all claims to the Spanish kingdom in favour of his ally the Emperor of the French." In this renunciation, after a strenuous opposition, Don Carlos, as well as Ferdinand, was compelled to join. The brothers were sent to Prince Talleyrand's house at Valençay, where they were detained prisoners, though treated with great respect, till 1813, when Napoleon restored them to liberty and Ferdinand to the throne of Spain.

When, after the suppression of the constitutional party by the French invasion under the Duc d'Angoulême, Ferdinand appeared inclined to adopt a somewhat more moderate policy, the absolutists turned their attention towards Don Carlos, and determined if possible to raise him to the throne. A conspiracy of a formidable character was organised, and an insurrection broke out in Catalonia in 1825, but was repressed by the vigorous measures of the Count d'España.

Don Carlos had himself taken no open share in the insurrectionary movements of his partisans. He was heir to the throne, and it is probable he was anxious not to endanger his succession by a premature declaration. His hope of legal succession was however quickly dispelled. Ferdinand had been three times married without having any children, but by his fourth wife, Christina, he had in October 1830 a daughter, Isabella, the present queen of Spain. By the ancient laws of Spain females could inherit the crown in default of male issue; but the Salic law of France had been introduced with the Bourbons, and females continued to be excluded from the throne till 1789, when Carlos IV. abrogated the restriction, and restored the ancient rule of succession. In 1812 however the Cortes re-established the Salic law, and Don Carlos was therefore still the heir-presumptive to the throne. But Ferdinand now issued a decree which annulled the provision of the Cortes, and restored the order of succession in the female line. Don Carlos protested, but remained quiet. His partisans however throughout the kingdom prepared for the struggle which the weak state of the king's health showed to be not very distant. In September 1833 Ferdinand was believed by himself and those about him to be dying, and the feeble king, terrified at the mischiefs which he was assured would result from the measure which excluded his brother from the throne, and acting on the advice of his favourite minister Calomarde, signed a decree by which he restored the Salic law. [CALOMARDE.] Ferdinand however rallied, and was easily induced by his sister-in-law to destroy the evidence of his recent

vacillation. He died a few days later, and his death was the signal for a general rising of the adherents of Don Carlos in opposition to Queen Isabella, who had succeeded to the throne of her father.

For full five years Spain was desolated by a civil war, in its early period at least one of the most atrociously cruel which has ever disgraced a civilized country. Carlos was supported by the great body of the priests, by a large portion of the country party, and by nearly the whole of the inhabitants of the Basque provinces—the bravest and most devoted portion of the Spanish people. Had he been a man of more energy and ability, the great probability is that he would have succeeded. But he possessed in full the hereditary bigotry, weakness, and obstinate folly of his race, and he more often marred, than followed up the successes which his generals achieved. Yet the energy and courage of his generals, Cabrera and Zumalacarrqui, maintained the balance decidedly in his favour, till the valuable aid of the British legion under General Sir de Lacy Evans, and the death of Zumalacarrqui, turned the scale. The defection of Maroto, and the surrender of his army to Espartero in August 1839, left Carlos no alternative but flight, and he at once took refuge in France.

Louis Philippe assigned him a residence in the city of Bourges, where he was joined by his family, and where for some years he maintained a mimic court, in which was observed all the elaborate etiquette of the Spanish monarchy. At length sick of hope deferred, he in 1845 formally relinquished his claim to the Spanish crown in favour of his eldest son Don Carlos Louis Maria Fernando, Count de Montemolin. The abdication of Don Carlos was strongly opposed by his wife, the Princess Maria Teresa (daughter of John IV. of Portugal), and by his leading supporters, including General Cabrera. [CABRERA.] In Spain it probably strengthened the hands of the Queen; and the subsequent rising in favour of the Count de Montemolin was easily suppressed. Don Carlos was permitted in 1847 to remove to Trieste, where he remained in strict retirement to his death, March 10th, 1855.

*CARLYLE, THOMAS, a thinker and writer confessedly among the most original and influential that Britain has produced, was born in the parish of Middlebie, near the village of Ecclefechan, in Dumfriesshire, Scotland, on the 4th of December 1795. His father, a man of remarkable force of character, was a small farmer in comfortable circumstances; his mother was also no ordinary person. The eldest son of a considerable family, he received an education the best in its kind that Scotland could then afford—the education of a pious and industrious home, supplemented by that of school and college. (Another son of the family, Dr. John A. Carlyle, a younger brother of Thomas, was educated in a similar manner, and, after practising for many years as a physician in Germany and Rome, has recently become known in British literature as the author of the best prose translation of Dante.) After a few years spent at the ordinary parish school, Thomas was sent, in his thirteenth or fourteenth year, to the grammar school of the neighbouring town of Annan; and here it was that he first became acquainted with a man destined, like himself, to a career of great celebrity. "The first time I saw Edward Irving," writes Mr. Carlyle in 1836, "was six-and-twenty years ago, in his native town, Annan. He was fresh from Edinburgh, with college primes, high character, and promise; he had come to see our schoolmaster, who had also been his. We heard of famed professors—of high matters, classical, mathematical—a whole Wonderland of knowledge; nothing but joy, health, hopefulness without end, looked out from the blooming young man." Irving was then sixteen years of age—Carlyle fourteen; and from that time till Irving's and premature death the two were intimate and constant friends. It was not long before Carlyle followed Irving to that "Wonderland of knowledge," the University of Edinburgh, of which, and its "famed professors," he had received such tidings. If the description of the nameless German university however in "Barter Reassure" is to be supposed as allusive also to Mr. Carlyle's own reminiscences of his training at Edinburgh, he seems afterwards to have held the more formal or academic part of that training in no very high respect. "What vain jargon of controversial metaphysics, etymology, and mechanical translation, falsely named science, was current there," says *Tomlin's* sketch; "I indeed learned better perhaps than most." At Edinburgh, the professor of "controversial metaphysics" in Carlyle's day was Dr. Thomas Brown, Donald Stewart having then just retired, physical science and mathematics were represented by Playfair and Sir John Leslie, and classical studies by men less known to fame. While at college, Carlyle's special bent, so far as the work of the classes was concerned, seems to have been to mathematics and natural philosophy. But it was rather by his voluntary studies and readings, apart from the work of the classes, that Mr. Carlyle in his youth laid the foundation of his vast and varied knowledge. The college session in Edinburgh extends over about half the year—from November to April; and during these months the college library, and other such libraries as were accessible, were laid under contribution by him to an extent till then hardly paralleled by any Scottish student. Works on science and mathematics, works on philosophy, histories of all ages, and the great classics of British literature, were read by him indiscriminately or in orderly succession; and it was at this period also, if we are not mistaken, he commenced his studies—not very usual then in Scotland—in the foreign languages of modern Europe. With the same diligence, and in very much the same way,

were the summer vacations employed, during which he generally returned to his father's house in Dumfriesshire, or rambled among the hills and moors of that neighbourhood.

Mr. Carlyle had begun his studies with a view to entering the Scottish Church. About the time however when these studies were nearly ended, and when, according to the ordinary routine, he might have become a preacher, a change of views induced him to abandon the intended profession. This appears to have been about the year 1819 or 1820, when he was twenty-four years of age. For some time, he seems to have been uncertain as to his future course. Along with Irving, he employed himself for a year or two as a teacher in Fifeshire; but, gradually it became clear to him that his true vocation was that of literature. Accordingly, parting from Irving about the year 1822, the younger Scot of Annandale deliberately embraced the alternative open to him, and became a general man of letters. Probably few have ever embraced that profession with qualifications so wide, or with aims so high and severe. Apart altogether from his diligence in learning, and from the extraordinary amount of acquired knowledge of all kinds which was the fruit of it, there had been remarked in him from the first a strong originality of character, a noble earnestness and fervour in all that he said or did, and a vein of inherent constitutional contempt for the mean and the frivolous, inclining him, in some degree, to a life of isolation and solitude. Add to this, that his acquaintance with German literature in particular had familiarized him with ideas, modes of thinking, and types of literary character, not then generally known in this country, and yet, in his opinion, more deserving of being known than much of a corresponding kind that was occupying and ruling British thought.

The first period of Mr. Carlyle's literary life may be said to extend from 1822 to 1827, or from his twenty-sixth to his thirty-second year. It was during this period that he produced (besides a translation of Legendre's 'Geometry,' to which he prefixed an 'Essay on Proportion') his numerous well-known translations from German writers, and also his 'Life of Schiller.' The latter and a considerable proportion of the former were written by him during the leisure afforded him by an engagement he had formed in 1823 as tutor to Charles Buller, whose subsequent brilliant though brief career in the politics of Britain gives interest to this connection. The first part of the 'Life of Schiller' appeared originally in the 'London Magazine,' of which John Scott was editor, and Hazlitt, Charles Lamb, Allan Cunningham, De Quincey, and Hood, were the best known supporters; and the second and third parts were published in the same magazine in 1824. In this year appeared also the translation of Göthe's 'Wilhelm Meister,' which was published by Messrs. Oliver and Boyd of Edinburgh, without the translator's name. This translation, the first real introduction of Göthe to the reading world of Great Britain, attracted much notice. "The translator," said a critic in 'Blackwood,' "is, we understand, a young gentleman in this city, who now for the first time appears before the public. We congratulate him on his very promising debut; and would fain hope to receive a series of really good translations from his hand. He has evidently a perfect knowledge of German; he already writes English better than is at all common, even at this time; and we know no exercise more likely to produce effects of permanent advantage upon a young mind of intellectual ambition." The advice here given to Mr. Carlyle by his critic was followed by him in so far that in 1827 he published in Edinburgh his 'Specimens of German Romance,' in four volumes—one of these containing, 'Wilhelm Meister's Wanderjahre,' as a fresh specimen of Göthe; the others containing tales from Jean Paul, Tieck, Muscous, and Hoffmann. Meanwhile, in 1825, Mr. Carlyle had revised and enlarged his 'Life of Schiller,' and given it to the world in a separate form through the press of Messrs. Taylor and Hessey, the proprietors of the 'London Magazine.' In the same year, quitting his tutorship of Charles Buller, he had married a lady fitted in a prominent degree to be the wife of such a man. (It is interesting to know that Mrs. Carlyle, originally Miss Welch, is a lineal descendant of the Scottish Reformer Knox.) For some time after the marriage Mr. Carlyle continued to reside in Edinburgh; but before 1827 he removed to Craigenputtock, a small property in the most solitary part of Dumfriesshire.

The second period of Mr. Carlyle's literary life, extending from 1827 to 1834, or from his thirty-second to his thirty-ninth year, was the period of the first decided manifestations of his extraordinary originality as a thinker. Probably the very seclusion in which he lived helped to develop in stronger proportions his native and peculiar tendencies. The following account of his place and mode of life at this time was sent by him in 1828 to Göthe, with whom he was then in correspondence, and was published by the great German in the preface to a German translation of the 'Life of Schiller' executed under his immediate care:—"Dumfries is a pleasant town, containing about fifteen thousand inhabitants, and to be considered the centre of the trade and judicial system of a district which possesses some importance in the sphere of Scottish activity. Our residence is not in the town itself, but fifteen miles to the north-west of it, among the granite hills and the black morasses which stretch westward through Galloway almost to the Irish Sea. In this wilderness of heath and rock our estate stands forth a green oasis, a tract of ploughed, partly inclosed and planted ground, where corn ripens and trees afford a shade, although surrounded by sea-mews and rough-wooled sheep. Here, with no small effort, have

we built and furnished a neat substantial dwelling; here, in the absence of a professional or other office, we live to cultivate literature according to our strength, and in our own peculiar way. We wish a joyful growth to the roses and flowers of our garden; we hope for health and peaceful thoughts to further our aims. The roses indeed are still in part to be planted, but they blossom already in anticipation. Two ponies which carry us everywhere, and the mountain air, are the best medicine for weak nerves. This daily exercise, to which I am much devoted, is my only recreation; for this nook of ours is the loneliest in Britain—six miles removed from any one likely to visit me. Here Rousseau would have been as happy as on his island of Saint-Pierre. My town friends indeed ascribe my sojourn here to a similar disposition, and forbode me no good result; but I came hither solely with the design to simplify my way of life, and to secure the independence through which I could be enabled to remain true to myself. This bit of earth is our own: here we can live, write, and think as best pleases ourselves, even though Zouli himself were to be crowned the monarch of literature. Nor is the solitude of such great importance, for a stage-coach takes us speedily to Edinburgh, which we look upon as our British Weimar. And have I not too at this moment, piled upon the table of my little library, a whole cart-load of French, German, American, and English journals and periodicals—whatever may be their worth! Of antiquarian studies, too, there is no lack."

Before this letter was written Mr. Carlyle had already begun the well-known series of his contributions to the 'Edinburgh Review.' The first of these was his essay on 'Jean Paul,' which appeared in 1827; and was followed by his striking article on 'German Literature,' and by his singularly beautiful essay on 'Burns' (1828). Other essays in the same periodical followed, as well as articles in the 'Foreign Quarterly Review,' which was established in 1828, and shorter articles of less importance in Brewster's 'Edinburgh Encyclopedia,' then in course of publication. Externally, in short, at this time Mr. Carlyle was a writer for reviews and magazines, choosing to live, for the convenience of his work and the satisfaction of his own tastes, in a retired nook of Scotland, whence he could correspond with his friends, occasionally visit the nearest of them, and occasionally also receive visits from them in turn. Among the friends whom he saw in his occasional visits to Edinburgh were Jeffrey, Wilson, and other literary celebrities of that capital (Sir Walter Scott, we believe, he never met otherwise than casually in the streets); among the more distant friends who visited him none was more welcome than the American Emerson, who, having already been attracted to him by his writings, made a journey to Dumfriesshire, during his first visit to England, expressly to see him; and of his foreign correspondents the most valued by far was Göthe, whose death in 1832, and that of Scott in the same year, impressed him deeply, and were finely commemorated by him.

Meanwhile, though thus ostensibly but an occasional contributor to periodicals, Mr. Carlyle was silently throwing his whole strength into a work which was to reveal him in a far other character than that of a mere literary critic, however able and profound. This was his 'Sartor Resartus'; or, an imaginary History of the Life and Opinions of Herr Teufelsdröckh, an eccentric German Professor and Philosopher. Under this quaint guise (the name 'Sartor Resartus' being, it would appear, a translation into Latin of 'The Tailor done Over,' which is the title of an old Scottish song) Mr. Carlyle propounded, in a style half serious and half grotesque, and in a manner far more bold and trenchant than the rules of review-writing permitted, his own philosophy of life and society in almost all their bearings. The work was truly an anomaly in British literature, exhibiting a combination of deep speculative power, poetical genius, and lofty moral purpose, with wild and riotous humour and shrewd observation and satire, such as had rarely been seen; and coming into the midst of the more conventional British literature of the day, it was like a fresh but barbaric blast from the hills and moorlands amid which it had been conceived. But the very strangeness and originality of the work prevented it from finding a publisher; and after the manuscript had been returned by several London firms to whom it was offered, the author was glad to cut it into parts and publish it piecemeal in 'Fraser's Magazine.' Here it appeared in the course of 1833-34, scandalising most readers by its gothic mode of thought and its extraordinary torture, as it was called, of the English language; but eagerly read by some sympathetic minds, who discerned in the writer a new power in literature, and wondered who and what he was.

With the publication of the 'Sartor Resartus' papers, the third period of Mr. Carlyle's literary life may be said to begin. It was during the negotiations for their publication that he was led to contemplate removing to London—a step which he finally took, we believe, in 1834. Since that year—the thirty-ninth of his life—Mr. Carlyle has permanently resided in London, in a house situated in one of the quiet streets running at right angles to the river Thames at Chelsea. The change into the bustle of London from the solitude of Craigenputtock was, externally, a great one. In reality however it was less than it seemed. A man in the prime of life when he came to reside in the metropolis, he brought into its roar and confusion not the restless spirit of a young adventurer, but the settled energy of one who had ascertained his strength and fixed his methods and his aims.

Among the Maginns and others who contributed to 'Fraser,' he at once took his place as a man rather to influence than to be influenced; and gradually as the circle of his acquaintance widened so as to include such notable men as John Mill, Sterling, Maurice, Leigh Hunt, Browning, Thackeray, and others of established or rising fame in all walks of speculation and literature, the recognition of his rare personal powers of influence became more general and deep. In particular in that London circle in which John Sterling moved was his personal influence great, even while as yet he was but the anonymous author of the 'Sartor Resartus' papers, and of numerous other contributions, also anonymous, to 'Fraser's Magazine,' and the 'Edinburgh,' 'Foreign Quarterly,' 'British and Foreign,' and 'Westminster' Reviews. It was not till 1837, or his forty-second year, that his name, already so well known to an inner circle of admirers, was openly associated with a work fully proportional to his powers. This was his 'French Revolution: a History,' in three volumes, the extraordinary merits of which as at once a history and a gorgeous prose-epic are known to all. In 1838 the 'Sartor Resartus' papers already republished in the United States, were put forth collectively with his name; and in the same year his various scattered articles in periodicals, after having similarly received the honour of republication in America, were given to the world in four volumes in their chronological series from 1827 to 1837, under the title of 'Miscellanies.' Mr. Carlyle's next publication was his little tract on 'Chartism,' published in 1839, in which, to use the words of one of his critics, "he first broke ground on the Condition of England Question."

During the time when these successive publications were carrying his name through the land, Mr. Carlyle appeared in a new capacity, and delivered four courses of lectures in London to select but crowded audiences, including many of the aristocracy both of rank and of literature—the first, a course on 'German Literature,' delivered at Willis's Rooms in 1837; the second, a course on 'The History of Literature, or the Successive Periods of European Culture,' delivered in Edward-street, Portman-square, in 1838; the third, a course on 'The Revolutions of Modern Europe,' delivered in 1839; and the fourth, a course on 'Heroes, Hero-worship and the Heroic in History,' delivered in 1840. This last course alone was published; and it became more immediately popular than any of the works which had preceded it. It was followed in 1843 by 'Past and Present,' a work contrasting in a historico-philosophical spirit English society of the middle ages with English society in our own day; and this again in 1845 by 'Oliver Cromwell's Letters and Speeches, with elucidations and a connecting narrative;' such being the unpretending form which a work originally intended to be a history of Cromwell and his times ultimately assumed. By the year 1849 this work had reached a third edition. In 1850 appeared the 'Latter-Day Pamphlets,' in which, more than in any previous publication, the author spoke out in the character of a social and political censor of his own age. From their very nature as stern denunciations of what the author considered contemporary fallacies, wrongs, and hypocrisies, these pamphlets produced a storm of critical indignation against Mr. Carlyle, which was still raging when, in 1851, he gave to the world his 'Life of John Sterling.' While we write (April 1856) this, with the exception of some papers in periodicals, is the last publication that has proceeded from his pen; but at present the British public are anxiously expecting a 'History of the Life and Times of Frederick the Great,' in which he is known to have been long engaged. A collection of some of the most striking opinions, sentiments, and descriptions contained in all his works hitherto written has been published in a single volume entitled 'Passages selected from the Writings of Thomas Carlyle' (1855), from the memoir prefixed to which by the editor, Mr. Thomas Ballantyne, we have derived most of the facts for this notice.

An appreciation of Mr. Carlyle's genius and of his influence on British thought and literature is not to be looked for here, and indeed is hardly possible in the still raging conflict of opinions—one might even say, passions and parties—respecting him. The following remarks however by one of his critics, seem to us to express what all must admit to be the literal truth:—"It is nearly half a generation since Mr. Carlyle became an intellectual power in this country; and certainly rarely, if ever, in the history of literature has such a phenomenon been witnessed as that of his influence. Throughout the whole atmosphere of this island his spirit has diffused itself, so that there is probably not an educated man under forty years of age, from Caithness to Cornwall, that can honestly say that he has not been more or less affected by it. Not to speak of his express imitators, one can hardly take up a book or a periodical without finding some expression or some mode of thinking that bears the mint-mark of his genius." The same critic notices it as a peculiarity in Mr. Carlyle's literary career that, whereas most men begin with the vehement and the controversial, and gradually become calm and acquiescent in things as they are, he began as an artist in pure literature, a critic of poetry, song, and the drama, and has ended as a vehement moralist and preacher of social reforms, disdaining the etiquette and even the name of pure literature, and more anxious to rouse than to please. With this development of his views of his own function as a writer, is connected the development of his literary style, from the quiet and pleasing, though still solid and deep beauty of his earlier writings, to

that later and more peculiar, and to many disagreeable form, which has been nicknamed 'the Carlylees.'

CARMAGNOLA, FRANCESCO RUSSONE DI, count of Castelnuovo, was born at Carmagnola, a town of the province of Turin in Piedmont, about the year 1250 of humble parents. Early in life he enlisted into the troop of Facino Cane, a celebrated Condottiere of his time, who was in the service of the Visconti, dukes of Milan. As he rose in rank he took the name of Carmagnola, from the place of his birth. After the death of Facino, Filippo Maria Visconti made Carmagnola his general-in-chief, as a reward for his bravery and services. Carmagnola was chiefly instrumental in placing Filippo Maria on the dual throne of Milan, and he afterwards added to his dominions Piacenza, Brescia, Bergamo, and other towns. Filippo Maria created him Count of Castelnuovo, gave him in marriage his relative Antonietta Visconti, and sent him to Genoa as governor. In 1424 Filippo Maria, who was of a dark suspicious temper, having listened to the unfavourable reports of some courtiers around him, ordered Carmagnola to be deprived of his military command, upon which the latter repaired to the duke to remonstrate with him; but being denied an audience, he rode off with a few trusty companions, left the territory of Milan, and after some wanderings repaired to Treviso, in the Venetian territory, where the duke sent an assassin to murder him, but the plot failed. He then went to Venice, where he arrived in February 1426.

The Venetian senate having declared war against the duke, in January 1426, appointed Carmagnola their captain-general. Carmagnola defeated the duke's troops and took from him the province of Brescia, which was from that time incorporated with the Venetian state. In 1427 he defeated again near Masodio, the duke's troops, which were led by Sforza, Pergola, Piccinino, and Torello, all celebrated Condottieri of that time. After the battle, despite the remonstrances of the Venetian commissioners, Carmagnola permitted his soldiers, who were chiefly mercenaries, to liberate all their prisoners, according to the custom then prevalent among the Italian Condottieri; the reason of which was, that as those troops fought merely for pay, they did not wish utterly to destroy their antagonists, for fear that the war should come to an end too soon.

In 1428 peace was made between Venice and the duke, but in 1431 war broke out again, and Carmagnola, retaining the command of the Venetian army, attacked the castle of Soncino, but failed after a considerable loss. Shortly after, in July of the same year, the duke's flotilla on the Po defeated that of Venice, in sight of Carmagnola's camp, who was not in time to support it. That commander was accused of neglect and even suspected of treachery. The senate wrote him a letter of reproof, but continued him in command. In the following October Carmagnola attempted to surprise Cremona; part of his men entered the town, but the citizens rising in a mass, drove out the assailants. This failure increased the suspicions and fears of the Venetian senators, who determined to deprive Carmagnola of his command, but fearing to attempt it while he was in the midst of his soldiers, by whom he was beloved, they invited him by courteous letters to repair to Venice in order that they might consult with him on the peace to be made with the duke. Carmagnola went to Venice, where he was received with marked distinction, and was led immediately to the dual palace. Being introduced into the hall of the Council of Ten, he was all at once charged with treason, arrested, taken to the adjoining prison, examined secretly, put to the torture, and condemned to death. On the 5th of May 1432 he was led out, with his mouth gagged, to the Piazzetta of St. Mark, and there beheaded between the two pillars. His property was confiscated to the state. Concerning the guilt or innocence of this celebrated commander much diversity of opinion prevails. Manzoni, in his 'Notizie Storiche,' which accompany his drama 'Il Conte di Carmagnola,' has fully examined the question and referred to the authorities on both sides. Of the treacherous conduct of the Venetian senators there can be no question.

CARNEADES, a native of Cyrene in Africa, was the founder of the school of philosophy called the New Academy. The precise date of his birth is difficult to ascertain: it was probably about B.C. 214. He appears to have received his first instruction in philosophy from Diogenes the Stoic, and hence the joke recorded by Cicero ('Acad. Quest.' iv. 20): he sometimes said, "If I have argued correctly, I am satisfied; if badly, Diogenes shall give back his mina." He afterwards attended the lectures of Egesinus, master of the academy, and succeeded him in the chair. In this situation he attained great eminence, and so high was the estimation in which he was held that (Cicero, 'De Orat.' ii. 37; 'Aul. Gell.' vii. 14) he was selected with two others, Diogenes the Stoic, and Critolaus the Peripatetic, to go on an embassy from Athens to Rome (A.C. 154.) Cicero ('De Fin.' iii. 12) praises him for his great eloquence, which Anulus Gellius (vii. 14) describes as vehement and rapid, differing in this respect from the correct and elegant style of Diogenes and the quiet and chaste style of Critolaus. Cicero ('De Orat.' ii. 38) says that he never defended a point which he did not prove, or opposed an argument which he did not overthrow. Even other philosophers and orators, it is said, constantly resorted to his school. (Jung Sturt, 'Life of Carn.') Carneades not unfrequently sacrificed personal comfort and cleanliness to labour in his favourite pursuits; he sometimes forgot to take his meals, and often

grudged the time necessary for combing his hair, &c. Before disputing, as he frequently did, with Chrysippus the Stoic, he was accustomed to brace the powers of his mind by the exhibition of hellebore. ('Valer. Max.' viii. 7.) He died at the age of ninety, according to Cicero ('Acad. Quest.' iv. 6) and Valerius Maximus (viii. 7.)

The doctrines of Carneades appear to have differed little from those of Arcesilaus and the other philosophers of the Middle Academy. The difference consisted more perhaps in the mode of statement than in the tenets themselves. Clitomachus, who succeeded Carneades, owned that he was never able to ascertain what the precise doctrines of his predecessor were. Carneades maintained that as the senses and understanding frequently deceive us, nothing which we learn by means of them can be certain; that the highest point we can attain is great probability, and that of probability there are several degrees. He considered that all the knowledge which the human mind was capable of gaining ought not to be called knowledge but opinion, as there was no sure test of truth. Arcesilaus appears to have maintained the same tenets, but to have asserted them in a broader and more offensive manner. He was chiefly employed in destroying the systems of others by means of his doctrine of uncertainty, and he almost entirely disregarded the application of his principles in the form of ethics; while Carneades, on the other hand, devoted himself partly to their practical use in the affairs of life. The constructive method of Carneades preserved him from the odium and suspicion which the destructive and aggressive method had brought upon Arcesilaus. [ARCESILAUS.]

CARNEGIE, SIR ROBERT, of Kinnaird, son of John de Carnegie, who was killed at the battle of Flodden, was sometime chamberlain of Arrbroath, and having attached himself to the regent Arran, was on July 4th 1547 appointed a lord of session. The following year he was sent to England to treat for the ransom of the Earl of Huntly, Chancellor of Scotland, who had been taken prisoner at the battle of Pinkie. He was soon afterwards despatched on a mission to the court of France; and when there was requested by King Henri II. to use his influence with Arran for the resignation of the regency in favour of the queen dowager, which was effected. In 1551 we find him clerk to the treasurer of Scotland, and one of the commissioners named to conclude a peace with England; and in 1554 and 1556 he was again employed in a like capacity. At the breaking out of the Reformation he at first took part with the queen regent, and was employed by her in negotiating with the lords of the congregation; but afterwards he joined the latter, and was despatched by them to the courts of England and France to explain their intentions. He died on the 5th of July, 1566. He was in all likelihood the author of the work on Scots law, which is cited in Balfour's 'Practicks' by the quaint title of 'Lib. Carnegie,' or 'Carnegie's Book.'

CARNOT, LAZARE NICHOLAS MARGUERITE, was born of respectable ancestry at Nolay, in Burgundy, on the 13th of May 1753. He entered the army in the corps of engineers in 1771, and at the time the revolution began was known as a respectable and well-informed officer, who had gained the prize of the Academy of Dijon for an eulogy of Vauban, and had refused large offers to enter the service of Frederick of Prussia. In 1791 he was elected to represent the Pas de Calais in the legislative assembly, and became a member of the military committee. He was one of those who voted the death of the ex-king. In 1793 he became a member of the committee of public safety. His name does not directly appear as an advocate of, or an agent in, any of the excesses of the violent republicans; but he stood high in place during those times of fury. So far as his acts are evidence, his attention was entirely directed to the affairs of his profession; he was in truth the war-minister of the committee. The most glorious period (in a military sense) of the republic was that in which he directed the raising of all the matériel of the army, and it was afterwards said of him that he had "organisé la victoire." In 1793 he joined the army of the north with other deputies; the inefficiency of another general called him into action, and he was mainly instrumental in gaining the victory of Watignies. In 1795 he was elected for fourteen different places, but was shortly afterwards proscribed, and sought refuge in Germany. He was recalled by the First Consul, and was made minister of war. This post he lost when he voted against the consulate for life, and at the same time all the other military situations which he held. But after the Russian campaign, when France was on the eve of invasion, he offered his services to Napoleon, and received the command of Antwerp, which he held until the abdication of 1814. When Napoleon returned from Elba, he wished to return to Antwerp, but the emperor is said to have told him that a machine would answer the purpose there: he was again appointed minister of war. After the restoration he retired first to Warsaw, and then to Magdeburg, where he died on the 2nd of August, 1823. He was twice a member of the Institute, and twice expelled; the first time by the Directory, and afterwards on the restoration of 1814.

He published in 1786 an 'Essai sur les Machines en général,' and in 1808 his work 'De la Défense des Places Fortes.' The latter is a remonstrance to the officers of the army upon the disposition which existed to consider a place untenable after the enemy had gained the glacis. He endeavours to show that the most serious part of an officer's duty only begins when the body of the place is attacked, and brings a large number of illustrations from ancient and modern

warfare. He also explains the system of defence which goes by his name, namely, that of covering the guns from the enemy, and using them for vertical firing only, until the attack upon the body of the place begins.

The mathematical works of Carnot are remarkable for the elegance of his geometry and the clearness of his mode of expression. In his '*Réflexions sur la Méta physique du Calcul Infinitesimal*,' he enters upon the consideration of the system of Leibnitz; and the main point of his theory is, that there is a compensation between the infinitesimals of inferior orders which are rejected on both sides of an equation. In his '*Géométrie de Position*' (Paris, 1803), his object is to explain the meaning of the negative sign in geometry, but at the same time he gives a large number of new and very general theorems. Here he is the inventor of that class of general theorems which have since been pushed to a great extent by Messrs. Poncelet, Dandelin, Quetelet, Chasles, &c. There is also his memoir upon the relation of five points taken in space, followed by his theory of transversals, Paris, 1806. The essay on machines in general was enlarged and republished in 1803, under the title '*Principes fondamentaux d'Equilibre et du Mouvement*.' He published also some political tracts, and in particular, a justification of his public conduct in 1815.

The fullest and best account of Carnot yet published is Arago's '*Notice Biographique*,' read before the Académie des Sciences, August 21, 1837, and published in the first volume of his *Œuvres*, pp. 511-633; but it will be well to bear in mind that although M. Arago says "it is a biography, not a panegyric," it is in fact an eulogy, and as such it must be read.

CARPENTER, DR. LANT, was born September 2, 1780, at Kidderminster, and was descended both on the father's and mother's side from old non-conformist families in that town. In consequence of his father's failure in business, he was at an early age adopted by a Mr. Pearsall, a relation of his mother, a man of piety and benevolence. Being designed for the ministry, he was sent in 1797 to the dissenters' academy at Northampton. But about a year after Lant Carpenter entered it, the establishment was for a time broken up, the trustees being dissatisfied with its condition, and especially with the real or supposed heterodoxy of the students. Lant Carpenter's friends were probably for the most part Arians: his own views appear to have been still more remote from the standard of reputed orthodoxy. The students had however their exhibitions continued to them for the full term, and Lant Carpenter finished his academical career at Glasgow.

On leaving college he was engaged for a time as assistant in the school of the late Rev. J. Corrie at Birmingham, and was afterwards one of the librarians of the Athenæum at Liverpool, where he became acquainted with Mr. Roscoe, Dr. Currie, and other literary men. While here, he received overtures from several congregations to become their minister, and was offered a tutorship in Manchester College, York, the principal academical institution of the Unitarians. He declined these, but accepted an invitation to succeed the Rev. T. Kenrick as one of the ministers of the Unitarian congregation at Exeter, to which place he removed in 1805. About this time he married. He remained at Exeter twelve years, fulfilling the duties of his office with exemplary diligence, and especially devoting himself to the instruction of the young people of the congregation. He had also a small boarding-school. In 1806 he applied for the degree of M.A. to the university of Glasgow, and the senate sent him instead the degree of LL.D. In the course of the same year he proposed the establishment of a public library at Exeter, took the lead in carrying the proposal into effect, and managed the institution for the first year. He also aided in the establishment of a Lancasterian school and of a savings bank in the town, and incited his congregation to establish a Sunday-school. He occasionally took part in public affairs when questions of religious liberty were concerned.

In 1817 he removed to Bristol, as one of the ministers of the Unitarian congregation there. Here his labours in the discharge of his ministerial duties were continued; and his own school was much enlarged. He also interested himself in objects of general utility, and took an active part in organising the Bristol Literary and Philosophical Institution. His health failing, he in 1826 resigned his pastorship at Bristol and spent some time in travelling in England and on the continent; by which his health and spirits were gradually restored. At the beginning of 1829 he resumed, by invitation, his ministry at Bristol; but his school, which had been for a time carried on for him, was given up. In 1839 his health, which had been for some time declining, once more gave way, and in June a painful depression of health and spirits came on. He was again recommended to travel, and while going in a steam-boat from Naples to Leghorn, fell overboard unperceived and was drowned, in the night of the 5th of April 1840. His body was afterwards found on the coast of the Papal territory near Porto d'Anzo, the ancient Antium, and was interred on the sea-shore.

Dr. Carpenter was an industrious and useful writer. His publications, including those which were posthumous, amounted to forty-four. Many of these were polemical or other sermons or pamphlets which do not require notice here. The following are his more important works:—'*An Introduction to the Geography of the New Testament*,' 12mo, 1805: this work has gone through several editions. '*Unitarianism the Doctrine of the Gospel*,' 12mo, 1809. '*An Examination of the Charges made against Unitarianism, &c.*' by Dr. Magee, in his

Discourses on Atonement, &c., 8vo, 1820. '*Principles of Education Intellectual, Moral, and Physical*,' 8vo, 1820: this work is a reprint of articles which he had contributed to Rees's '*Cyclopædia*.' '*A Harmony or Synoptical Arrangement of the Gospels*,' 8vo, 1835, of which a second edition, under the title of '*An Apostolical Harmony of the Gospels*,' was published in 1838. It is probably on this valuable work that Dr. Carpenter's reputation as a divine and an author will ultimately rest. '*Sermons on Practical Subjects*,' 8vo, 1840: this posthumous volume was edited by his son, Dr. W. B. Carpenter, the subject of the following article. An interesting memoir of Dr. Carpenter, by his second son, the Rev. Russell Lant Carpenter of Bridgewater, forms a companion volume to the *Sermons*, and has furnished the materials of the present article. '*Lectures on the Scripture Doctrine of Atonement*,' 12mo, 1843; also posthumous, edited by his third son, the Rev. P. P. Carpenter of Stand near Manchester. Besides his separate publications he contributed the chapters on Grammar, Mental and Moral Philosophy, and Ancient Geography, to a work called '*Systematic Education*,' 2 vols. 8vo, 1815; the articles on Grammar, and Mental and Moral Philosophy, to Nicholson's '*Cyclopædia*;' and several papers to Aikin's '*Annual Review*,' and to Rees's '*Cyclopædia*.' He was also a frequent contributor to the periodicals of his own religious denomination.

*CARPENTER, WILLIAM BENJAMIN, M.D., one of the most distinguished physiologists and writers on the science of physiology of the present day. He is the son of the late Dr. Lant Carpenter noticed above. On leaving school he commenced a course of study preparatory to entering upon the career of a civil engineer. His tastes however led him ultimately to enter the medical profession, and he joined the medical classes of University College about 1833, where as a student he was distinguished for his accurate knowledge, and especially for the elegance of his written compositions. He passed his examination at the Royal College of Surgeons and Apothecaries Society in 1835. He subsequently pursued his studies in the University of Edinburgh, where his capacity for original thought and dealing with the most profound physiological discussions became apparent. One of his earliest papers on the subject of physiology was published in the '*Edinburgh Medical and Surgical Journal*' (No. 132), with the title '*On the Voluntary and Instinctive Actions of Living Beings*.' In this paper may be discovered the germs of those views which he has since so fully developed in his various works on physiology. He graduated at Edinburgh in the year 1839, but not until he had published the three following papers:—1. '*On the Unity of Function in Organised Beings*' ('*Edinburgh New Philosophical Journal*'); 2. '*On the Differences of the Laws regulating Vital and Physical Phenomena*' (*Ibid.*); 3. '*Dissertation on the Physiological Inferences to be deduced from the Structure of the Nervous System in the Invertebrate Class of Animals*.' This last paper was published in Edinburgh in 1838, and translated in Müller's '*Archiv*,' for 1840. In these papers he laid the foundations of those principles which he afterwards developed more fully in an independent work entitled '*Principles of General and Comparative Physiology*,' intended as an Introduction to the study of Human Physiology, and as a guide to the philosophical pursuit of Natural History,' 8vo, London, 1839. This work was one of the first in our language to give a general view of the science of life, and to point out the relation of physical laws to vital phenomena. That there should be errors in detail could only be expected. It was a most remarkable production for so young a man, and at once fixed on him the attention of physiologists as one of the most promising cultivators of their science. A second edition appeared in 1841.

He now settled in Bristol with the view of practising his profession, and was appointed lecturer on medical jurisprudence in the medical school of that city. The practice of his profession however was less in accordance with his tastes than the study of the literature of the science by which alone it can be advanced. With an almost unrivalled facility of acquiring and communicating knowledge, it is not to be wondered at that he found it more agreeable to supply the necessities of a family by writing books on science than by submitting to the drudgery demanded of those who would succeed in medical practice. In 1843 and subsequent years he wrote the '*Popular Cyclopædia of Science*,' embracing the subjects of mechanics, vegetable physiology and botany, animal physiology, and zoology. These works were professedly only compilations, but they contain many of the author's original views, and are written in an agreeable style.

Soon after the publication of these volumes, Dr. Carpenter employed himself in the production of a volume on the '*Principles of Human Physiology*,' which was published in London in 1846. This work, which perhaps at first hardly did justice to the author's reputation, reached a fourth edition in 1853; of this edition, it may be truly said to be altogether the best work on the subject extant. If the author has not repeated the experiments of other observers, he has the great merit of appreciating correctly the labours of others; and in those departments of physiology which are beyond the region of experiment, and demand the more subtle analysis of a logical mind, such as the functions of the nervous system, the science of physiology has no more accomplished exponent.

Whilst the '*Human Physiology*' was passing through its several editions, the '*Principles of Comparative and General Physiology*' reached a third edition, thus forming a companion volume. It has

however been thought advisable to separate the General from the Comparative Physiology, and in 1884 a volume entitled the 'Principles of Comparative Physiology' was published. This is to be followed by the 'Principles of General Physiology,' in one volume. The two works will therefore be thenceforth published as three independent volumes, comprising the whole range of biological science.

These works are a cyclopædia in themselves, and indicate not only a large amount of labour in their production, but a vast extent of careful reading and research. Such works might well have occupied a lifetime. But these are only a portion of Dr. Carpenter's labours; for he has been a constant contributor to the 'Cyclopædia of Anatomy and Physiology,' where some of the most important articles—as those on 'Life,' 'Microscope,' 'Nutrition,' 'Secretion,' 'Sleep,' 'Smell,' 'Taste,' 'Touch,' and 'Varieties of Mankind'—are from his pen. Such a writer must be a critic; and as a critic Dr. Carpenter has exposed himself to the censure of men less gifted than himself, and he has been charged as a plagiarist, and a mere compiler. This however is not true. If Dr. Carpenter had done nothing more than publish his papers on the 'Structure of Shells,' and the 'Correlation of Vital and Physical Forces,' he would have stood high as a man of science. In an answer to this charge, in the preface to the third edition of his 'General and Comparative Physiology,' he claims the following facts and doctrines as his own:—

1. The mutual connection of the vital forces and their relation to the physical. This doctrine is fully developed in a paper on the 'Mutual Relations of the Vital and Physical Forces,' in the 'Philosophical Transactions' for 1850.

2. The general doctrine that the truly vital operations of the animal as well as the vegetable organism are performed by the agency of untransformed cells, which was first developed in an 'Essay on the Origin and Functions of Cells,' published in the 'British and Foreign Medical Review' for 1843.

3. The organic structure of the shells of *Mollusca*, *Echinodermata*, and *Crustacea*, of which a full account is contained in the 'Reports of the British Association' for 1844 and 1847.

4. The application of Von Baer's law of development from the general to the special, to the interpretation of the succession of organic forms presented in geological time.

5. The relation between the two methods of reproduction, that by germination and that by sexual union, with the application of this doctrine to the phenomena of the so-called 'alternations of generations' first developed in the 'British and Foreign Medico-Chirurgical Review' for 1848 and 1849.

6. The relation between the different methods of sexual reproduction in plants, first developed in the 'British and Foreign Medico-Chirurgical Review' for 1849.

7. The application of the doctrine of reflex action to the nervous system of *Invertebrata*, especially articulated animals, first developed in the author's prize thesis published in 1839.

8. The functional relations of the sensory ganglia to the spinal cord on the one hand, and to the cerebral hemispheres on the other.

In addition to the works above mentioned, Dr. Carpenter has published a 'Manual of Human Physiology' for the use of students, which has gone through several editions. His last work, which has just issued (1888) from the press, is 'On the Microscope; its Revelations and its Uses.' It displays the same industry, accuracy, and impartiality as his other writings; and undoubtedly deserves a high position amongst works devoted to an account of the structure and uses of this instrument. Reference has been made to Dr. Carpenter's researches in the structure of shells. This has led him to investigate the family of small creatures known by the name of *Foraminifera*. He has already published several papers on the fossil forms of this family, and is preparing a work on the structure, functions, and general history of this group of animals, for publication by the Ray Society.

Dr. Carpenter for many years edited the 'British and Foreign Medico-Chirurgical Review,' but whilst thus occupied with writing he has also performed the duties of lecturer. He is professor of medical jurisprudence in University College, London; lecturer on general anatomy and physiology at the London Hospital School of Medicine; and an examiner in physiology and comparative anatomy in the University of London. Dr. Carpenter was admitted a Fellow of the Royal Society in 1844. In 1849 Dr. Carpenter gained a prize of 100 guineas offered for the best essay on the subject of 'Alcoholic Liquors.' His essay was published in 1850 under the title of the 'Use and Abuse of Alcoholic Liquors,' and acquired great popularity, especially among those who adopt the principle of total abstinence from intoxicating drinks. It has been since more than once reprinted.

CARPI, UGO DA, a celebrated old Italian wood-engraver, who lived in the early part of the 16th century, and has the credit in Italy of having been the inventor of printing in light and shade with wooden blocks. Scarcely a circumstance of his life is known beyond the above, and that his father was Count Astolfo di Canicchio; though it has been stated, we are not aware on what authority, that he was born about 1490, and died about 1530: it is only certain that he flourished in the early part of the 16th century. From his name it would appear that he was born at Carpi, but even this is disputed: he seems to have lived chiefly at Modena. He was also a painter, and some authorities make him the scholar of Parmegiano, others the scholar of Raffaello. In

painting however he did very little; only one of his pictures is recorded, 'St. Veronica between St. Peter and St. Paul,' and that for the following singular inscription upon it:—'Ugo da Carpi ha fatto questa pittura senza pennello: chi non lo crede si becca il cervello' ('Ugo da Carpi painted this picture without a brush; who does not believe it may scratch his head'). He painted it with his finger. It is still preserved in the sacristy of St. Peter's at Rome, and when it was shown to Michel Angelo he coolly remarked, "It would have been a much better picture if he had used a brush."

Heineken and Bartsch describe thirty-one of Ugo's prints, but only some of these have his name to them. It is difficult therefore to identify his cuts, because Andreani and Antonio da Trento engraved in a similar style, and also published many prints without their names. Ugo's prints are very scarce, and nearly all after Raffaello and Parmegiano: some of them are very large. They are generally well drawn, and executed with perfect understanding of the light and shade: the earliest date upon them is 1518. Vasari, in the 'Life of Marcantonio,' mentions as among his masterpieces 'Diogenes and his Tub,' after Parmegiano; and 'Æneas bearing away Anchises,' after Raffaello. He used generally three blocks: one for the outline, another for the middle tints, in which the high lights were cut out, and the third for the shadows.

CARPINI, JOHANNES DE PLANO. Early biographers and historians are so silent with regard to this remarkable monk of the 13th century, that we can neither discover the time nor the place of his birth. Indeed little is known of him except through his own account of his travels, and this account was probably not all written by himself. The probabilities are that he was born at a village in the province of Capitanata, in the kingdom of Naples (Plano di Carpino), about 1210. He became a friar of the order of St. Francis, or of the Minorites—an order which was then recently established, and which was distinguished in its earlier stages by the zealous, enterprising, and fearless spirit of its members. In 1246, when Europe was thrown into consternation by the irruptions of the Mongols, who had ravaged Russia, Poland, Hungary, and other countries, Pope Innocent IV., after holding a grand council of the church at Lyon (1245), resolved to send legates to these formidable conquerors, in order to pacify them, and if possible to convert them to the Christian faith. For this purpose six monks or friars were selected from the new and severe orders, namely, two from the Franciscan order and four from the Dominican order. Johannes de Plano Carpini (as his name is Latinised) appears to have been the first chosen by the pope, on account of his abilities and courage; and his companion, a monk of his own order, was one Benedict, a Pole, whose knowledge of some of the north-eastern countries of Europe was very useful. These two friars were instructed to take their route through Bohemia, Poland, and Russia, and then by the north of the Caspian Sea. The other four friars, Asceline and Alexander, Albert and Simon de St. Quintin, were ordered to proceed through Syria, Persia, and Khorassan by the south of the Caspian Sea. The most fearful accounts prevailed of the ferocity and indomitable courage of these Asiatic invaders. A letter had been recently circulated, written by one Yvo of Narbonne, or Narbonne, to the Archbishop of Bordeaux, containing the confession of an Englishman (who had lived among them), touching the barbarous demeanour of these Tartars. The Englishman, according to his confession, or according to this letter, had been perpetually banished out of the realm of England for certain notorious crimes, and had betaken himself to the Holy Land. Not long after his banishment, being at Acon (Acre, or St. Jean d'Acre), and thirty years old, he there lost all his money at dice. Then, having nothing but a shirt of sackcloth, a pair of shoes, and a hair-cap, and being shaven like a fool, he set out on his travels through Syria and Asia Minor; and, to prosper the better, he feigned idiocy and dumbness, for idiots have been at all times objects of superstitious reverence with the Turks; and the pretence of being dumb aided in concealing the fact that he was a Giaour, or Christian. After long wandering he fell among the Mongol Tartars, learned their language, and went with them when they began to march upon Europe. The horde which he followed was defeated and driven back by a mighty army collected by the Duke of Austria, the Duke of Bohemia, the patriarch of Aquileia, and others, including the Prince of Dalmatia, who took eight prisoners, and among them this strange Englishman. The letter describes our countryman as being "somewhat learned," and as having been employed as interpreter and ambassador by the Tartars in their communications with the Christian princes. The account this man gave to his captors was flimsy and very short, and full of horror and exaggeration. Matthew Paris records this famous letter under the date of the year 1243.

But the intrepid monks of the two new orders were not deterred by any prospect of danger. "And although," says the introductory epistle to the travels of Carpini and his comrade friar Benedict, "we personally dreaded from these Tartars and other nations that we might be slain or reduced to perpetual slavery, or should suffer hunger and thirst, the extremes of heat and cold, reproach, and excessive fatigue beyond our strength (all of which, except death and captivity, we have endured, even beyond our first fears); yet did we not spare ourselves, in order that we might obey the will of God, according to the orders of our lord the pope, and that we might be useful in some things to the Christians, or at least, that the will and

intention of these people might be assuredly known and made manifest to Christendom, lest suddenly invading us, they should find us unprepared, and so make incredible slaughter of the Christian people." In Poland and Russia, and wherever the widely-spread Slavonian language was spoken, Friar Benedict the Pole served the Italian as interpreter. The two monks ran great danger of being murdered by the people of Lithuania, who appear to have been at this time many degrees less civilised than the Mongols. In Russia they were upon the whole hospitably and kindly entertained. As the Russians adhered to the Greek or Eastern church, Carpin in a public meeting exhorted the grand duke and his bishops to abandon their heresy, and boldly read to them the letters of Pope Innocent, wherein they were admonished to return into the unity of the Roman Catholic church. Although our Franciscan effected no conversion, he raised no animosity by this boldness. He and his companion Benedict received good advice as to the best means of dealing with the Tartars, and went sent forward to Kiow, then the chief city of Russia, and not very far from the uncertain moveable frontier of the Mongols. At Kiow they hired an interpreter; but they afterwards found reason to lament that this man was unequal to the duties he had undertaken to perform. The Mongols at this time occupied all the country between China, Siberia, and the Caspian Sea, the van of this nomadic pastoral army being on the river Dnieper, and its rear under the great wall of China. The subordinate khans or chiefs passed the two monks onward from post to post until they came to the head-quarters of the great Baatu. These posts were far apart. The country where Baatu had his camp (called by the travellers Comania) was far beyond the Caspian Sea. But their toils were not yet over: Baatu ordered them to proceed to the court of his sovereign, the Khan of khans and Emperor of all men. They then entered a country called by them 'the country of the pagan Naymani,' where they travelled for many days, till they came to the proper lands of the Mongols. Through this latter country they journeyed for about three weeks, continually riding with great expedition. "In the whole of this journey," say the monks, "we used extraordinary exertion, as our Tartar guides were commanded to bring us on with all expedition: on which account we always travelled from early morning till night, without stopping to take food; and we often came to our quarters so late, as not to get any food that night, but were forced to eat in the morning what we ought to have had for supper. We changed horses frequently every day, and travelled constantly as hard as our horses could go." It is not easy to name the places or even to trace the route which they followed; but they appear to have passed by the head of the Baikal Lake, and to have traversed great part of the country vaguely denominated Chinese Tartary, going in the direction of the 'Everlasting Wall,' or the great wall of China. In all the vast regions occupied by the Mongols and their flocks and herds there was not one fixed town, there was scarcely a house; for the people of all degrees, and even their khans and the very emperor himself, lived constantly in tents, and moved from place to place as pasturage, or war, or other business required. Wherever the great chiefs were, the assemblage of tents and the camp had a name, which the monks set down; but in all probability, within a short time after their passage, these tents were all struck and removed to a distant quarter, and the populous spot was left a solitude in the vast surrounding wilderness. They must have found the Emperor or Great Khan somewhere to the north of the sandy desert which spreads itself between the Great Wall and Tartary, as there is no mention made of their travelling on camels, or of their entering upon that desert. Here they do not attempt to name the place, merely calling it the Court of the Emperor. This great potentate, whom they call Kujak or Cuyne Khan, had many spacious tents, one being so vast that it could have contained 2000 men. Princes and great lords from China, a duke from Russia, two sons of the King of Georgia, and an envoy of the Kalif of Baghdad, were waiting submissively upon the Mongol conqueror. In these circumstances, scarcely intelligible letters and an admonitory message from the pope delivered by two poor bare-legged friars were not likely to make much impression upon the great shepherd-warrior. While the friars stayed about the gilded tent, a warlike ceremony was performed, which they interpreted into a defiance against the Church of Rome, the Roman empire, and all the Christian kingdoms and nations of the West; and they were otherwise informed that it was the intention of these Mongols to subdue all the kingdoms of the earth, as Zinghis (Genghis) Khan had commanded them to do. The Lord of the World however admitted them to an audience, received from them the letters of the pope, and gave them in return letters for his Holiness written in the Mongol language and also in Arabic. The monks complain that during their stay there, which continued a whole month, they were in such extreme distress for victuals and drink that they could hardly keep themselves alive; adding that they must verily have perished at last if God had not sent to their aid a Russian goldsmith, who was in favour with the emperor, and who procured them some food. At last, on the feast of St. Brice (the 13th of November 1247), they received permission to depart from this inhospitable court. They returned by the same route, travelling the whole winter through the desert, and often sleeping at night on the snow. On the 9th of June 1248 they reached Kiow, where their Russian friends joyfully received them. In all they had past sixteen months entirely among the Mongols and the people that had been

conquered by them. Pope Innocent had enjoined them to be diligent and accurate in their observations, and faithful in reporting what they saw and heard of these strange people who had made all Europe tremble. The friars acted up to these instructions, and, allowance being made for the state of geography and other sciences, and for the condition and superstitions of the time, the account which Carpin or his friends gave to the world was an admirable little book of travels, the accuracy of which has been confirmed by John Bell of Antermomy (BELL, JOHN), and other and later travellers through the vast regions which intervene between European Russia and China. Carpin was the first to uproot a set of monstrous fables, and to give a true and striking picture of the peculiar civilisation of the Tartars. But at the same time he revealed their number, warlike strength, and close political union; and warned the disunited and distracted kingdoms of Christendom that if these hordes moved westward they would be found irresistible, unless a league of Christian princes were previously formed for the single purpose of opposing them. The chapter entitled 'How the Tartars are to be resisted,' is full of good sense.

It appears that Friar John returned to Italy, and that there, with some assistants, he published his plain unvarnished account of his travels in a 'Libellus,' or small book, in Latin. Of this book or manuscript (of which no doubt there were once many copies) we have never been able to obtain a sight. It seems to be known solely through the 'Speculum Historiale' of Vincentius Belvacensis, where it is inserted at full length, together with some information about their journey, which the author or editor, Vincentius, says he received from Simon de St. Quintin, one of the four friars who had gone by the south of the Caspian, and whose information was very meagre compared with that of Carpin. From the 'Speculum Historiale' Ramusio transferred all this matter, together with an Italian translation to follow the Latin text, into the second volume of his 'Raccolta di Navigazioni e Viaggi,' which was printed by Giunti at Venice, in the year 1556. From this admirable work of Ramusio, our own good compiler, Richard Hakluyt, copied the matter into the first volume of his 'Navigations and Discoveries,' which was published in London towards the close of Queen Elizabeth's reign, in the year 1599. Hakluyt, who of course only transfers the Latin text, gives a good sterling translation of his own; but he omits several passages which are given by Ramusio. From Ramusio or from Hakluyt all modern and indeed all existing accounts of Carpin and Friar Benedict have been drawn. Bergeron gave an abridgment of the matter in his 'Voyages faits principalement en Asie dans les 12^e, 13^e, 14^e et 15^e siècles, par Benjamin de Tudele, Carpin, Rubruquis, &c., la Haye, 1729-55. A somewhat modernised translation of the Latin text of Hakluyt is given in R. Kerr's 'History and Collections of Voyages and Travels,' Edinburgh, 1824.

CARR, JOHN, a noted English architect in the latter half of the 18th century, was born in 1721, at Horbury, near Wakefield, Yorkshire; at which place he afterwards built a church that was founded by himself. His practice was very considerable in Yorkshire and the adjoining counties, where he erected several stately mansions, and other buildings both public and private. He was twice lord mayor of York, in 1770 and 1785; and realised a handsome fortune, being said to have been at the time of his death worth not less than 150,000*l*. He died at his residence, Askam Hall, Yorkshire, February 22, 1807, aged eighty-six. Carr belonged to the Anglo-Palladian school, and if he rarely displayed much fancy, he never fell into frippery, like Adam, nor did he, like Wyatt, mistake nakedness and tenuity for simplicity. Among his principal works are the Town Hall at Newark, Notts.; the Crescent at Buxton; the Bridge at Boroughbridge; Harewood House, Yorkshire, one of his best mansions; Tabley House, and the splendid Mausoleum of the Marquis of Rockingham at Wentworth. This mausoleum is shown in plate 61 of Stieglitz's 'Belle Architecture.' There is a good portrait of Carr in the second volume of Dance's 'Collection of Portraits,' which work also contains the portraits of several other architects of the same period.

CARRARA, DA, the name of an historical family of Italy, which held sovereign sway over Padua and the neighbouring provinces during the middle ages. Like most of the north Italian nobility of that period the Carrara appear to have been of Longobard origin. One of their ancestors, by name Luitolf, is recorded as the founder of the abbey of Carrara, in the territory of Padua, about 1027, and as having built a castle in the neighbourhood, which had feudal jurisdiction granted to the owner by the emperor of Germany. Several of Luitolf's descendants filled municipal offices in the community of Padua. Marsilio da Carrara was put to death by Ezzelino, tyrant of Padua. After the death of Ezzelino, in 1259, Padua was restored to its municipal independence as an important member of the Guelf league, and as such found itself at variance with the Della Scala, lords of Verona, who were Ghibelines. Jacopo da Carrara commanded the troops of Padua against Can della Scala in the early part of the 14th century. The citizens of Padua, being distracted by factions, elected Jacopo for their lord in 1318. Jacopo died in 1324, and was succeeded by his nephew Marsilio, who, being hard-pressed by the Della Scala of Verona, was assisted by the republic of Venice in repelling them. He died in 1338, and was succeeded by his nephew Ubertino, who, dying in 1345, was succeeded by Marsilietto his relative, who belonged to

distant branch surnamed Carrara Pappafava. After two months Marcellino was stabbed by Jacopo II., nephew of the first Jacopo. This Jacopo II. was himself murdered by a relative in 1350, and was succeeded by his brother Jacopino, jointly with Francesco his nephew, son of Jacopo II. Francesco da Carrara being at the head of the troops, arrested his uncle in 1355, and confined him in a fortress. He then remained sole lord of Padua. His reign was eventful. He was at the head of the Lombard or Guelph league against the Visconti of Milan. He afterwards entered into a war against Venice, but was obliged to conclude a humiliating peace, and to send his son to Venice to make apology. In 1378 he joined the Genoese in their attack against Venice, by which the republic was brought to the brink of ruin, a consummation which Francesco was determined to effect, but which was prevented by the patriotism of the citizens of Venice, and by the timely arrival of Carlo Zeno with his squadron. In 1381 peace was made. A fresh quarrel of Francesco with Antonio della Scala of Verona, led to an alliance of Francesco with Gian Galeazzo Visconti, who, after taking Verona, turned round against his ally, took Padua and Treviso, arrested Francesco in 1383, and kept him prisoner till his death at Monza in 1393. Francesco da Carrara was intimate with Petrarch, who speaks of him in his works.

Francesco II., called Novello, after his father's imprisonment wandered as an emigrant about Italy and France, begging for assistance to recover his father's territories, and at last he re-entered Padua in 1407. Having made peace with Visconti, he repaired to Venice, where, in presence of the senate, he expressed his gratitude for the assistance which he had received from the republic during his struggle against Visconti, swore perpetual friendship to Venice, and had his name inscribed in the golden book in the roll of the patricians. He however broke his word, and lost thereby his territory, and was taken prisoner to Venice, where he was strangled with two of his sons, in the dungeons of the ducal palace, in 1406, according to the barbarous practice of the Venetian senate in those times. Venice took possession of Padua, Treviso, and the other territories of the Carrara. Many years after, the last remaining son of Francesco, named Marsilio, having formed a conspiracy to recover possession of Padua, was seized and put to death in 1435.

(Litta, *Memorie Celebri Italiane*; Sandi, *Storia Civile di Venezia*; Vergerio, *Vita Carraenium Principum ad ann. 1355*; Verri, *Gianbattista, Notizie Storico-genealogiche de' Signori da Carrara*; Ticossi, *Vaggi de' Messer Francesco Novello da Carrara, Signor di Padova e di Todi sua Consorte*, Milan, 1823. This last is a kind of historical novel of the wanderings of Francesco II., after his father's imprisonment.)

CARREL, ARMAND NICOLAS, was born at Rouen, on the 8th of August 1800. He was the son of a draper in good circumstances in that city. At the age of seventeen he joined a regiment of cavalry, and the following year entered the military school of St.-Cyr. His political opinions had already taken the shape of principles, and these were so liberal, and so frankly enunciated, as to draw upon him, first the friendly remonstrance, and afterwards the censure of the governor, General d'Angoulême, who was entirely devoted to the court. At the close of 1818 he was made second lieutenant of the 29th regiment of infantry, which was sent to the garrison of Belfort in 1821. The conspiracy which bears the name of this town, and has become historical, broke out in the following January, and Carrel was one of the many officers drawn within its vortex. But this time he was neither molested nor discovered.

Spain being invaded in 1823 by the French army under the Duke of Angoulême, Carrel took part with the Constitutionalists, and fought under Mina. "Some time after," says his friend the historian Rabbe, "he was one of the Frenchmen who were obliged to lay down their arms and surrender after the capitulation of Leris in Catalonia; but this capitulation not having been ratified by the French government, he was arrested on his return to France, and tried by three successive courts-martial." After being twice sentenced to death, and twice escaping through legal informalities, and suffering thirteen months' imprisonment, he was tried a third time at Toulouse, and, being acquitted, he returned to Paris in 1825 almost penniless, having closed against him for ever that profession of arms to which his early years had been devoted. Shortly after, he was engaged by Augustin Thierry, the author of the 'Conquest of England by the Normans,' to act as his secretary, and he took notes and made extracts for the last volume of that celebrated work. Introduced to the leading publishers by Thierry, he now wrote several 'Résumés,' or outlines of history, and grew into notice among the literary celebrities of the time. But his keen susceptibility could not endure even the gentle curb of the kindest employer, so he resolved to try his fortune alone. He left Thierry, and supported himself for several months by contributing to the reviews and newspapers. The boldness of his thoughts, and the clearness and originality of his style, were gradually making their impression on men's minds. But his gains were small, and at one time (1827) he opened a book-shop of his own, to endeavour to increase his precarious income. It was in the little parlour behind that shop that he wrote the book which will survive him, his 'History of the Counter-Revolution in England.'

On the 1st of January 1830 the 'National' appeared, with Thiers, Mignet, and Carrel as its editors. This journal took at once a most

decided course of opposition to the government of Charles X., and showed an advocacy equally distinct in favour of the Duke of Orleans, afterwards Louis Philippe: whence arose a suspicion, probably groundless, that the prince had furnished the capital. When the Polignac ministry issued the fatal ordinances of July, Carrel stood forward and wrote the first declaration of resistance in the 'National,' and the next morning appeared the spirited protest, which was universally distributed, and called the nation to arms. "Carrel did not," says Louis Blanc, "mingle in the ranks of the combatants as one of the fighters, but he went about to the different groups, with a black sash in his hand, saying to them, 'Vous n'avez qu'un bataillon' ('You have only one battalion')." He did not believe that a popular outbreak could succeed against regular soldiers, and his two previous condemnations explain his reluctance to act rashly.

His two colleagues being employed by the new government, from that time until his deplorable death in 1836, Carrel took up a position as a journalist, such as no man in any country had won before. During the short but powerful administration of Casimir Perrier in 1832, his spirit proved too strong for the government, and a new stretch of arbitrary power was prevented. Subsequently he was prosecuted by the crown, and heavy penalties levied on his journal. He was several times imprisoned. On one occasion he spoke as advocate for a fellow-prisoner in the Chamber of Peers, when he startled the whole country by his invocation of the memory of Marshal Ney. After this his name was on every tongue, and he became the idol of the popular party.

But the well-balanced mind of this writer was not made for either extreme: he resisted the despotism of government; but he shrunk still more from revolutionary violence. Surrounded by all the fiery spirits of the day, he gauged the different parties which were forming, and found that he did not belong to them. This sad conviction preyed upon his heart. "He shuddered," says a recent historian, "to see himself at the head of certain men whose very obedience was rude and imperative; he distrusted their zeal, and ascribed to them a longing for vengeance, and a pre-determined despotism, which his own moderation disclaimed." This despondency became gradually habitual, and, in such a state of mind, Carrel was too easily drawn into that unhappy newspaper quarrel with Emile de Girardin, the editor of the 'Presse,' which led to the duel that so abruptly closed his career. Mortally wounded by a pistol-shot, he expired at St.-Mandé, on the 24th of July 1836, in his thirty-sixth year. Arago, Beranger, Cornemin, and a crowd of distinguished deputies and writers followed him to the grave. His bust, by the sculptor David, marks the spot where he lies; but as yet no competent biography of this remarkable man has appeared.

(Rabbe, *Universal Biography*; Louis Blanc, *Ten Years*; *Galerie des Contemporains Illustres*.)

CARSTARES, WILLIAM, a Scottish ecclesiastic, distinguished for his political exertions in furtherance of the Revolution settlement, was born at Cathcart, near Glasgow, on the 11th of February 1649. His father was the Rev. John Carstares, minister of the High Church, Glasgow, who, like his son, but in a less degree and with less diplomatic capacity, took a lively share in the ecclesiastico-political movements of his time; offered a violent opposition to Cromwell's schemes of general toleration, and suffered by the prevalence of his own principles of clerical coercion during the persecutions of the Covenanters under Charles II. (See 'Notices of the Life of the Rev. John Carstares,' by the Rev. William Ferrie.) William Carstares acquired the rudiments of his education in a neighbouring village school, and afterwards studied in the University of Edinburgh. He appears to have become in early life not only an accomplished scholar, but an accurate observer of men. During a great portion of the latter end of the reign of Charles II. he lived in Holland, and studied theology at Utrecht, where he is supposed to have taken orders. Accident introduced him to the notice of the pensionary Fagel, who, finding in the young clergyman great sagacity and self-reliance, and a knowledge of the political institutions of his own country seldom equalled at his early years, recommended him to his master, the Prince of Orange, afterwards William III., who, anxious to have about his person individuals acquainted with the politics of Britain, chose young Carstares as one of his confidential advisers; and events justified the selection. The time of his return to Britain is not precisely known. He was in London in 1682, and was more or less connected with the projects on which the prosecutions in connection with the Rye-house and assassination plots were founded. There is reason to presume that he was the medium of communication between the court of Holland and some of the parties prepared for insurrection. He was, at all events, in the secrets of the Argyle party in Scotland, and the key to a cipher through which Argyle and Monmouth corresponded was found to be in his handwriting. A warrant to apprehend him was issued, and he was discovered attempting to conceal himself in Kent. Sufficient evidence could not be obtained to bring him to trial in England, and he sued out a writ of habeas corpus, which was defeated by sending him to Scotland, where the practice of torture still remained a stain on the administration of justice. In the presence of the Privy Council of Scotland he was subjected to the torture of the 'thumbigen,' or thumb-screw, which he bore with great fortitude, refusing to divulge the secrets he possessed. He was subsequently presented by the Privy

Council with one of these cruel instruments, which he bequeathed as an heir-loom to his family; and it is a traditional anecdote that William III., having desired to experience the initial symptoms of this species of torture, the divine turned the screw at his request, but rather too vigorously for his Majesty's nerves. Carstares was ultimately released on a sort of compromise, by which he confessed a knowledge of matters which were otherwise proved in the trial of Baillie of Jerviswood. He returned to Holland with all his really important secrets undivulged, and was warmly received by the prince, who, in devising the expedition which created the Revolution of 1688, is said to have mainly relied on the full knowledge of British parties, and the advice, both bold and sagacious, of Carstares. He was subsequently of great service in producing a reconciliation between the Scottish Presbyterians and William III., who could not precisely understand the pertinacity with which his northern subjects adhered to the principle of spiritual independence. A General Assembly being about to convene, at which it was understood that there would be a violent opposition to the oath of allegiance, the king, taking advice from less sagacious counsellors, had prepared and delivered to a messenger despatches directing the peremptory enforcement of the act. It is said that Carstares assumed authority to stop the messenger in his Majesty's name; and presenting himself to the king (who had gone to bed) in the middle of the night, in the guise of a petitioner for his life, forfeited by his having thus committed high treason, to have prevailed on him to dispense with the oath. Whether the anecdote be true or not in all its circumstances, there is little doubt that his influence obtained the dispensation. He became now virtually prime minister for Scotland; and received the popular designation of 'Cardinal Carstares.' Even after the death of William, his knowledge of Scottish affairs, and the respect paid to his talents, left him with considerable influence. In 1704 he was chosen Principal of the University of Edinburgh. He died on the 28th of December 1715. (*State Papers and Letters addressed to William Carstares; to which is prefixed the Life of Mr. Carstares, Ato, 1774.*)

CARSTENS, ASMUS JACOB, a distinguished German artist, was born at St. Gûrgen, near Schleswig, May 10th, 1754. His father was a miller, but his mother, who was the daughter of an advocate at Schleswig, had been exceedingly well-educated, and was therefore able to bring up her three sons in a manner very superior to what the circumstances of the family would otherwise have allowed. After his father's death, which happened when he was about nine years old, Asmus was sent to the public school at Schleswig, where he made little or no progress; but the pictures in the cathedral there by Jurian Ovens, a pupil of Rembrandt, which seemed to him miracles of the pencil, determined him to become himself a painter. His mother readily seconded his inclination, and on his quitting school at the age of sixteen, applied to two painters to take him as a pupil; but the sum demanded was much greater than could prudently be afforded.

His mother soon after died, and his guardians refusing to listen to his earnest entreaties, placed him with a wine-merchant at Eckernforde. After the first feeling of despondency had passed over, he employed the whole of his leisure time, and frequently a considerable portion of the night, in drawing, and the reading of whatever books he could procure relative to art; and he about this time renewed his acquaintance with Ipsen, a young painter whom he had known at Schleswig, from whose instructions he obtained some insight into the management of colours and other technical matters. Having served five years, he purchased the remaining two of his apprenticeship, and proceeded to Copenhagen, where he again met with Ipsen, who procured for him free access to the Royal Gallery of Paintings, and to the collection of casts and antiques at the academy. Whilst prosecuting his studies here he endeavoured to support himself by taking likenesses in red chalk, and was so fortunate as to be thus enabled to continue his usual studies for two years longer, during which he produced his 'Balder's Death' and 'Æolus and Ulysses,' compositions that excited much notice, and would have obtained for him admittance into the academy, had he not given offence on a particular occasion. But having thus closed against himself the road to favour, he determined upon leaving Copenhagen and going to Rome along with his youngest brother (who had also been studying painting at Schleswig) and the sculptor Busch. Accordingly, they set out in the spring of 1783, and Carstens and his brother travelled on foot as far as Mantua, their companion having parted from them at Nuremberg. After passing an entire month at Mantua, chiefly occupied in examining the works of Giulio Romano, Carstens found that they must abandon their plan and return homewards. They accordingly set out again northward, passing through Switzerland to Lubeck, where Carstens was glad to take up with his former occupation of portrait painting, which he pursued for nearly five years; but he employed all the time not so occupied in making historical and poetical compositions. He also now began for the first time to read diligently; and the fruits of his studies shortly began to manifest themselves in a number of compositions from Homer, the Greek tragedians, and other great masters of poetry, both ancient and modern. But he felt that he was here in a great measure cut off from the hope of being able to produce any works of magnitude; and he therefore gratefully accepted the generous offer of Rodde, a wealthy amateur, who furnished him with the means of visiting Berlin.

In that capital he at first had to contend with pecuniary difficulties, and was obliged to make designs for book-prints. At length, his 'Fall of the Angels,' a large composition containing upwards of 200 figures, obtained for him an appointment as one of the professors at the academy, and the following year a considerable gratuity was added to his salary. His chief object however in accepting this post was as a means of obtaining a travelling pension to Rome, which he was now more than ever desirous of visiting. He had become acquainted with the architect Genelli, who was just returned from Italy, and on his recommendation was employed to decorate the walls of a saloon in the Dörville palace with a series of mythological subjects. This work procured for him an introduction to the king, who granted him a travelling pension, and in the summer of 1792 he again set out for Rome. He travelled through Dresden and Nuremberg, making some stay at the first place for the purpose of visiting the Gallery of Antiques and that of pictures; and at the latter, in order to become acquainted with the works of Albert Dürer, whom, after Michel Angelo and Raffaele, he held to be one of the greatest masters in his art.

Arrived at Rome, Rome for a long time existed to him only in the Vatican. His first object was to imbue himself thoroughly with the spirit of Michel Angelo and Raffaele, to catch if possible their modes of thought, and to trace their conceptions to their source. Highly wrought up as his expectations had been, he found them here surpassed, and that their works were instinct with a mental power of which no copies or engravings had before conveyed to him any idea. The severity of his principles of criticism obtained for him not a few enemies, and they more than insinuated that he could not perform what he exacted from others. He soon convinced them of the contrary by a large drawing representing the visit of the Argonauts to the centaur Chiron, a subject he had before produced at Berlin, but which he now recomposed, and in a style that plainly indicated how much he had already benefited by studying Michel Angelo and Raffaele.

The two years to which his stay at Rome was limited having expired, he begged hard for a little longer extension of the term, as he was preparing to make a public exhibition of the subjects which he had produced while in Italy. His exhibition was opened in April 1795, and consisted of eleven designs mostly poetical and mythological, and few of them ever before treated. Both in style and subject these works were an earnest of powers as superior as they were uncommon, and the artist's fame was soon spread through Germany by an article on the exhibition in Wieland's 'Mercur.' The same year he sent three compositions to Berlin, whereupon he was again urged to return to his post in the academy; but instead of its being complied with, this demand was followed by remonstrance and refusal on the part of Carstens, and his connection with the Berlin academy soon after ceased altogether. In the course of the two following years he produced many fine compositions, including a series of twenty-four subjects from Pindar, Orpheus, and Apollonius Rhodius, all of them illustrative of the Argonautic expedition. This series it was his intention to etch himself, but in the autumn of 1797 he was attacked by a serious malady, which was succeeded by a slow fever and an obstinate cough, whereby he was so enfeebled that he was unable to employ his pencil except for a very short interval in the day. Yet even after he was incapable of quitting his bed his wonted enthusiasm and energy did not forsake him; and but a few hours before his death he conversed with his friend Fernow respecting a mythological subject which had suggested itself to him. He expired on the 25th of May 1798, when he had just entered his forty-fifth year.

Thus may Carstens be said to have been prematurely cut off just as he had begun his career as an artist. In him Germany lost one who gave promise of taking rank among the greatest masters of the art. His life as yet had been a life of preparation. To art he gave himself undividedly; his whole soul was in it, so that, although he had not mastered some things that lie more on the surface, he had dived into its depths and recesses. What he chiefly valued was creative power, intelligence, and mind, of which he regarded external forms merely as the expression. Conformably with such opinions and theory was his own practice. His compositions, which he was in the habit of completely shaping out, maturing, and finishing up mentally, before he committed them to paper, are all marked by a severe simplicity and fine poetic conception; and had a longer life and health been granted to him, he would doubtless have left behind him works commensurate in other respects with their intellectual value, and which would have acquired for him the kind of fame he coveted.

CARTE, THOMAS, was born in April 1686 at Clifton in Warwickshire, of which parish his father, the Rev. Samuel Carte, was vicar. He matriculated at Oxford, but took his degree of Master of Arts in the University of Cambridge, and afterwards entered into holy orders, and was attached to the cathedral of Bath.

Carte's opinions were very strong in favour of the Stuart family, and his zeal brought on him some suffering. On the accession of George I. he declined to take the oaths of allegiance, and therefore abandoned the priesthood: in 1715 he was obliged to conceal himself lest he should be apprehended as participating in the rebellion; and in 1722 he was so strongly suspected of being concerned in the conspiracy of Bishop Atterbury (whose secretary he was), that a reward of 1000*l.* was offered for his apprehension. He escaped to France, where he

resided nearly twelve years under an assumed name. Again in 1744 he was arrested under a like suspicion of favouring the expected descent of the Pretender. He died near Abingdon in 1754.

So far as great labour and indefatigable research constitute an historian, Carte may lay claim to that character. His works consist of an edition of 'Thuanus,' in 7 vols. fol.; a 'Life of James, Duke of Ormonde,' in 3 vols. fol., and 4 vols. fol., of the 'History of England,' bringing it down to the year 1654. Besides pamphlets and some minor works, he likewise published at Paris a Catalogue, in French, of the Gascon, Norman, and French Rolls, preserved in the Tower of London. His manuscripts are preserved in the Bodleian Library at Oxford.

CARTER, ELIZABETH, was the daughter of Dr. Nicholas Carter, an eminent Latin, Greek, and Hebrew scholar, one of the six preachers in Canterbury cathedral, and perpetual curate of Deal in Kent, where his daughter Elizabeth was born December 16, 1717. Her mother, a Dorsetshire heiress of the name of Swayne, was supposed to have shortened her life by repining over the loss of her fortune, which had been invested in the South Sea Stock. Elizabeth was educated by her father, who made no distinction between her and her brothers. Though slow at first, she afterwards made rapid progress in the learned languages, to which she added Italian, German, Spanish, and French: she acquired the last in the house of a Protestant refugee minister, and the three former by her own exertions. Her proficiency in these studies did not lead her to neglect needlework, music, or the other accomplishments common to her sex. Miss Carter's earliest productions appeared in the 'Gentleman's Magazine' under the signature of 'Eliza.' In 1738 she published some poems in a very thin quarto volume, which were succeeded in the year following by a translation of some strictures by Croussas on Pope's 'Essay on Man.' In the same year she translated from the Italian of Algarotti 'An Explanation of Newton's Philosophy, for the Use of Ladies, in Six Dialogues on Sight and Colours.' These publications appearing before their author was twenty-two gave her immediate celebrity, and brought her into correspondence with most of the learned of that day. Among others may be mentioned Bishop Butler, the author of the 'Analogy,' Dr. Benson, bishop of Gloucester, and Archbishop Secker; Dr. Johnson, Sir Joshua Reynolds, and Burke. In the midst of her literary occupations she undertook the task of entirely educating her youngest daughter for the university, and performed it so as to merit the encomium of his examiners upon his admission. During her intervals of leisure she translated Epictetus for the amusement of her friend Miss Talbot, to whom the sheets were sent as they were finished, and shown to Archbishop Secker, who took an interest in the progress of the work. In compliance with the wishes of her friends she sent her translation to the press, and on its publication the literary journals at home and abroad were full of her praise. Dr. Johnson availed himself of her pen for a paper (No 44) for the 'Rambler.' Of her learning he thought so highly as to say, when speaking of an eminent scholar, that "he understood Greek better than any one whom he had ever known except Elizabeth Carter." This learned lady was never married. She lived to the age of eighty-nine, having died in 1806, leaving behind her a character adorned by finer qualities than even those of a highly-cultivated understanding. (Pennington, *Memoirs*.)

CARTERET, PHILIP, a naval officer, who commanded the 'Swallow,' which sailed on the 22nd of August 1766 on a voyage of discovery to the South Sea, under the orders of Captain Wallis, who sailed in the 'Dolphin.' The 'Swallow' being a bad sailer, the two ships were unable to keep company, and were at last parted in a gale of wind. Captain Carteret's voyage may therefore be considered as a separate expedition, and several interesting geographical discoveries were the result. He arrived in England on the 20th of February, 1769, after an absence of two years and a half. An account of his voyage is given by Dr. Hawkworth in the introduction to his 'Narrative of Captain Cook's First Voyage.'

CARTER, DES. [DES CARTER.]

CARTWRIGHT, EDMUND, was born on the 24th of April 1748, at Marnham, in the county of Nottingham. His family was ancient and highly respectable, and had suffered in its fortune on account of its attachment to the cause of Charles I. Edmund Cartwright received the early part of his education at Wakefield, and being intended for the church, he afterwards went to University College, Oxford, and was elected a Fellow of Magdalen College. He afterwards held the living of Brampton, near Chesterfield, and subsequently he removed to the living of Goadby-Merwood in Leicestershire. He wrote some poetical pieces at an early age, some of which were printed anonymously. In 1770 he published in his own name a legendary poem, entitled 'Arminia and Elvira,' which was received with much favour, and soon passed through several editions. He wrote also the 'Prince of Peace' and 'Sonnets to Eminent Men.' He was for a considerable time a contributor to the 'Monthly Review.' The duties of his calling were besides varied by a literary correspondence with several eminent individuals.

In the summer of 1784, during a visit at Matlock, happening to meet with several gentlemen from Manchester, the conversation turned upon the subject of mechanical weaving. Dr. Cartwright's attention had never been directed to mechanical inventions, but though in his fortieth year, the impulse which his mind received from this accidental

direction of its powers, enabled him by the following April to bring his first power-loom into action, which, though an extremely rude machine, soon received many valuable improvements. Its first introduction was opposed both by manufacturers and their workmen, owing to various prejudices; and a mill containing 500 of his looms, the first which had been erected, was wilfully burnt down. In 1813 there were not more than 2300 power-loom in the United Kingdom. In fact, when first introduced, and before various improvements were made in it, the machine was scarcely equivalent in its results to manual labour. It is scarcely necessary to say that the power-loom is now in almost universal use. In April 1790, Dr. Cartwright took out a patent for combing wool; altogether he obtained ten different patents for inventions and improvements of various kinds. In 1807 a number of the principal cotton-spinners memorialised the government on behalf of Dr. Cartwright, who had hitherto reaped little advantage from the exercise of his inventive talents. He also petitioned the legislature himself in support of his claims; and in 1809 parliament granted him 10,000*l.* for "the good service he had rendered the public by his invention of weaving." This was a smaller sum than he had expended on his projects, but it enabled him to pass the remainder of his days in ease and comfort. He died on the 30th of October 1823, in the eighty-first year of his age.

CARTWRIGHT, JOHN, brother of the preceding, was born at Marnham in 1740, and entered the navy at an early age. In 1774 he published 'Letters on American Independence,' and though attached to his profession he declined taking part in the struggle which ensued between the mother country and the North American colonies. In 1775 he received a major's commission in the Nottinghamshire militia, an appointment which the ministry regarded with displeasure. The attainment of annual parliaments and universal suffrage became the object of his exertions; and to further this end he was active in establishing the 'Society for Constitutional Information,' and in co-operating with Tooke, Hardy, Thelwall, and other advocates of reform. He was a witness on the trial of the above individuals; and in 1819 was himself the object of an ex-officio prosecution for having with others taken steps for procuring a 'legislatorial attorney' to be returned to parliament for the then unrepresented town of Birmingham. His name is intimately connected with the early history of the question of parliamentary reform. He possessed considerable intelligence and ingenuity, and was the author of several useful projects, and a number of pamphlets and occasional addresses. Though retaining his commission in the navy, he was invariably called Major Cartwright. He died on the 23rd of September, 1824, and would have completed his eighty-fourth year on the 28th. A bronze statue has been erected to his memory in Burton-crescent, London, by contributions from his admirers and friends.

(*Life and Correspondence of Major Cartwright*, edited by his niece, F. D. Cartwright, 2 vols. 8vo, London, 1826.)

CARTWRIGHT, WILLIAM, born in 1611, was the son of a person who, after having possessed a good estate, had sunk to the station of an innkeeper at Cirencester. He was educated at Westminster and Oxford; and, taking orders, received in 1643 an appointment in the church of Salisbury. In the same year he was one of the council of war named by the University of Oxford; and early in 1643 he became junior proctor and reader in metaphysics. He died in that year of a malignant fever, then epidemic in Oxford. Although Cartwright thus died before having completed his thirty-second year, he had attained high reputation both for learning and for genius. Precocity, rather than strength, must have been the quality which gained for him Ben Jonson's commendation, "My son Cartwright writes all like a man." A collected edition of his 'Comedies, Tragi-Comedies, and other Poems' appeared in 1647, and again in 1651. The miscellaneous poems which the volume contains are much inferior in merit to the four plays, one of which, 'The Ordinary,' has very justly received a place in the collection first published by Dodsley.

CARUS, MARCUS AURELIUS, prefect of the prætorium under the emperor Probus, succeeded him by the nomination of the soldiers, after they had murdered Probus (A.D. 282) in his camp near Sirmium, in the Illyrium. Carus was a native of Narbo, an old Roman colony, and as such he prided himself in being a Roman citizen by birth. (See his letter to the senate announcing his nomination, in Vopiscus, 'Historia Augusta.') He made war against the Sarmatians, and defeated them. He marched next against the Persians (A.D. 283), and

Coin of Carus.

British Museum. Actual size. Gold. Weight 75 grains.

took with him his younger son Numerianus, leaving his elder son Carinus to rule over Italy and the other provinces of the west in his absence. Carus overran Mesopotamia, and conquered Seleucia and Ctesiphon, after which, as he was encamped beyond the Tigris, a great

thunder-storm arose, and it was reported that the emperor was killed in his tent by the lightning: the servants upon this set fire to his tent, and his body was consumed. His secretary Calpurnius however, in a letter which he wrote to the prefect of Rome, said that the emperor, who was already ill, died during the storm. But the strongest suspicions rested upon Arrius Aper, prefect of the praetorium, the same who soon after killed Numerianus. Carus reigned about seventeen months. He was succeeded by his two sons, Carinus and Numerianus.

CARY. [FALELAND, LORD.]

CARY, REV. HENRY FRANCIS, was born at Birmingham in 1772, and was entered a commoner of Christ Church, Oxford, in 1790; having however already commenced author by the publication of 'An Irregular Ode to General Elliott' in 1787, and of a 4to pamphlet of 'Sonnets and Odes' in 1788. While at the university he devoted much of his time to the study of Italian, French, and English literature, as well as of Greek and Latin. Having taken his degree of M.A. in 1796, he was in 1797 presented by the Marquis of Anglesey to the vicarage of Bromley Abbot's, in Staffordshire, worth 187*l.* a year, with a residence. The same year he published 'An Ode to General Kosciusko.' In 1805 appeared his translation of the 'Inferno' of Dante in English blank verse, accompanied with the original Italian; and in 1814 his entire version of the 'Divina Commedia.' It was some years however before this work, to which Cary principally owes his literary reputation, attracted much attention. It was first brought into general notice by Coleridge, who spoke of it with warm praise in his lectures at the Royal Institution, and who is said to have become acquainted with it and with Cary himself about the same time. Ultimately its merits were generally acknowledged, and the author had the satisfaction of bringing out a fourth edition of it before his death. It is not only unusually careful and exact, but deserves the praise of very considerable force and expressiveness. It must however be considered as a defect detracting materially from its claim to be regarded as a faithful representation of the 'Divina Commedia' that it is in blank verse: rhyme is an essential element of the Gothic spirit and character of Dante's poetry. Cary afterwards produced verse translations of the 'Birds' of Aristophanes, and of the 'Odes' of Pindar; a series of 'Lives of English Poets,' in continuation of Johnson's, and another of 'Lives of Early French Poets,' in the 'London Magazine;' besides editions of the works of Pope, Cowper, Milton, Thomson, and Young. In 1826 he was appointed assistant librarian in the British Museum, but he resigned that situation in 1832, on the claim that he and his friends conceived he had to the office of keeper of the printed books being passed over in favour of another person. He some years afterwards received a pension of 200*l.* a year from the crown, which he enjoyed till his death, which took place at his house in Charlotte-street, Bloomsbury, 14th of August, 1844. He was interred on the 21st in Poet's Corner, Westminster Abbey.

(Memoir of the Rev. H. F. Cary; with Literary Journal and Letters, by his son, the Rev. H. Cary.)

CASAS, BARTHOLOMÉ DE LAS, was born at Seville of a noble family in 1474. When he was about twenty he accompanied his father, who embarked with Colombo in his second voyage to the West Indies. On his return to Spain he entered holy orders and became curate of a parish. After some years he went back to Hispaniola, where he found the Indian population cruelly oppressed by the Spaniards. By the system of 'repartimientos,' enacted by order of King Ferdinand of Aragon, and enforced by the governor Albuquerque, the unfortunate natives were distributed like cattle into lots of so many hundred heads each, and sold to the highest bidders, or given away to courtiers and other men of rank in Spain, who by their agents sold them to the colonists. The mortality became so great among these unhappy beings, who were naturally of a weak constitution, that out of 60,000 Indians, who were on the island of Hispaniola in 1503, only 14,000 remained in 1516. The Dominican friars were the only persons who loudly disapproved of this system; the secular clergy and even the Franciscans took part with the colonists. Las Casas sided with the Dominicans, and finding that Albuquerque was deaf to all their remonstrances, he sailed for Spain, asked and obtained an audience of Ferdinand, to whom he made such a dreadful picture of the fatal effects of the repartimientos, that the king's conscience became alarmed, and he promised Las Casas that he would remedy the abuse. But Ferdinand died soon after, and Charles I., commonly called Charles V., succeeded him. The minister Ximenes, who governed Spain in the absence of the young king, listened with favour to Las Casas' remonstrances, and appointed three superintendents from among the Hieronymites, an order which enjoyed great consideration in Spain, with instructions to proceed to the West Indies, and examine the matter on the spot, and with full authority to decide finally upon the great question of the freedom or slavery of the Indians. He sent with them a jurist of the name of Zuazo, who had a great reputation for learning and probity, and lastly, he added Las Casas to the commission with the title of 'Protector of the Indians.' The commission proceeded to Hispaniola in 1517. After listening to the statements of both parties, colonists and Dominicans, or friends of the Indians, and having also examined the physical and intellectual condition of the natives themselves, the Hieronymites came to the conclusion that the Indians would not work unless obliged to

do so; that their mental capacities were much lower than those of Europeans, and could not be stimulated to exertion or be made to follow any moral or religious rules, except by authority; and therefore they decided that the system of repartimientos must continue for the present at least, but at the same time they enforced strict regulations as to the manner in which the Indians should be treated by their masters, in order to prevent as much as possible any abuse of power on the part of the latter. Las Casas, not satisfied with this decision, set off again for Spain to appeal to Charles V. himself, who came about that time from Flanders to visit his Spanish dominions. The question was discussed in the king's council, and as the difficulty of cultivating the colonies without the repartimientos was the great objection, Las Casas, it is said, observed that the African blacks, who were already imported into the West Indies, were a much stronger race than the Indians, and might make a good substitute. This suggestion has been made, by most writers on American affairs, a ground of reproach against the memory of Las Casas. It ought to be observed however that the fact of the suggestion rests solely upon the authority of Herrera, who wrote thirty years after the death of Las Casas. The writers contemporary with Las Casas, and Sepúlveda himself, his determined antagonist, are silent upon this point. (Grégoire, 'Apologie de B. de Las Casas,' in the fourth volume of the 'Memoirs of Moral and Political Science of the French Institute.') It is certain, and both Herrera, and after him Robertson, acknowledge it, that, as early as 1503, negro slaves had been imported into America, and that in 1511 a large importation took place by King Ferdinand's authorisation. The Portuguese seem to have been the first Europeans who traded in black slaves. A negro was found to do as much work as four Indians. Charles V. granted a licence to one of his Flemish courtiers to import 4000 blacks into the West Indies. The courtier sold his licence to some Genoese speculators for 25,000 ducats, and the Genoese then began to organise a regular slave-trade between Africa and the New World. But the price of the blacks was so high that few of the colonists could avail themselves of this supply, and consequently the slavery of the Indians was perpetuated for a long time after, until the race became extinct on most of the islands.

Las Casas, unable to obtain the deliverance of the Indians through his oral remonstrances, resorted to his pen. He wrote—1st, 'Tratado sobre la materia de los Indios que se han hecho esclavos por los Castellanos;' 2nd, 'Brevisima relacion de la destruycion de las Indias Occidentales por los Castellanos,' in which he gives a frightful account of the acts of oppression and barbarity committed by the conquerors; 3rd, 'Remedios por la reformation de las Indias;' 4th, 'Treynta proposiciones pertenecientes al derecho que la Yglesia y los principes Cristianos tienen sobre los Infieles, y el titulo que los Reyes de Castilla tienen a las Indias Occidentales.' (Navarrete, 'Coleccion de los Viajes y Descubrimientos que hicieron por mar los Españoles, &c.,' 2 vols. 4to, Madrid, 1825, in which the author treats at length of Las Casas.)

Las Casas, despairing of effecting any good for the Indians in the Spanish settlements, formed the project of a new colony to be established on the recently-discovered tierra firma, or mainland, and to be managed according to his own views, which were afterwards realised in a great measure by the Jesuits in their settlements of Paraguay. Accordingly he obtained from Charles V. a grant of 300 miles along the coast of Cumana. But before he set out he had to sustain a public disputation, in the presence of the king and council, against Quevedo, bishop of Darien, who had lately returned from the West Indies, and whose opinions concerning the Indians were diametrically opposed to those of Las Casas. As usual in such cases, the controversy did not clear up the matter, and Charles, uncertain what to do, confirmed his grant to Las Casas for the sake of experiment. But before Las Casas could reach his destination, an expedition had sailed from Puerto Rico under Diego Ocampo, for the purpose of invading and plundering that very coast of Cumana which was intended by Las Casas for his pacific settlement. The consequence was, that the remaining natives conceived such a horror against the Spaniards that when Las Casas came to settle on the coast they attacked his settlement and killed or drove away the settlers. Las Casas, crossed in all his benevolent endeavours, and attacked by the sneers and reproaches of the colonists, went back to Hispaniola, where he took refuge in the convent of the Dominicans, whose order he entered in 1522. Some years after he returned to Spain, and made a fresh appeal to Charles V. in favour of the oppressed Indians. He then met an antagonist in Doctor Gines de Sepúlveda, who had written a book in defence of the slavery and destruction of the Indians, taking for his argument the treatment of the Canaanites by the Hebrews. Las Casas replied to him, and an account of the whole controversy is contained in the work which was published in 1552, styled 'Disputa entre el Obispo Fray Bartholomé de Las Casas y al Doctor Gines de Sepúlveda sobre la justicia de las conquistas de las Indias.' Las Casas had meantime been appointed Bishop of Chiapa, in the newly-conquered empire of Mexico. After remaining for many years in his diocese, ever intent on mitigating the sufferings which the natives endured from the conquerors, Las Casas returned to Spain in 1551, having resigned his bishopric, and died in a convent of his order at Madrid in 1566. He bore among both natives and Spaniards in the New World the names of Father and Protector of the Indians.

He left in manuscript '*Historia General de las Indias*,' in 3 parts or volumes, in which he treats of the discovery, conquest, and subsequent occurrences in the New World, as far as the year 1590. This work has never been published. The first two volumes, in his own handwriting, are preserved in the library of the Royal Academy of History, and the third in the royal library at Madrid. "In this work," says Navarrete, "Las Casas has displayed a vast erudition, mixed however with a disregard for temperance and discrimination. He had access to many original documents, which he has carefully copied or extracted, and for this he is entitled to the highest confidence. He was also present at several of the early expeditions and conquests, and for them his authority has been followed by Herrera and others. He does not however deserve the same credit when he speaks from hearsay, as he confesses that he wrote both what he had seen and what he had not seen but heard during sixty years of his life, which he passed chiefly in the New World, and it is no wonder that his memory should fail him at times, so as to confound events and dates."

CASAUBON, ISAAC, one of the most learned men of his age, was born at Geneva, on the 8th of February 1559. His father and mother, Arnold Casaubon and Jeanne Rousseau, were natives of the Dauphiné, and retired to Geneva to avoid a religious persecution. They returned however after the persecution ceased to Crest, a small town of Dauphiné, of which Arnold was appointed minister, and here young Casaubon studied under his father until his nineteenth year, when he went to Switzerland to hear the lectures of Francis Portus, a Crotan, who was then professor of Greek at Lausanne, and whom he succeeded on his death in 1582. In 1586 he married Florence, daughter of Henry Stephens, the celebrated scholar and printer. About 1591 he was involved in serious pecuniary difficulties from having been surety in a large sum of money for an Englishman named Wotton (probably the well-known Sir Henry, who afterwards brought Casaubon to England), and though Joseph Scaliger and some other friends assisted him, he was much straitened in his circumstances by this loss, and either this or the moroseness of his father-in-law induced him to accept an offer of the Greek professorship at Montpellier. He removed to Montpellier in the latter end of 1596, and commenced his duties in the February of the following year. In 1599 Henri IV. sent for him to Paris, and in the following year appointed him one of the Protestant judges in the controversy between Du Perron, bishop of Evreux, and Du Plessis Mornay. In 1603 he succeeded Gosselin as head librarian to the king. The Catholics made many attempts to gain so distinguished a convert; but there does not seem to be any reason for concluding that they had even partial success, although it was given out that he had wavered in a conference with Du Perron. The death of Henri IV., in 1610, rendered his stay in France neither safe nor profitable; and, having obtained permission from the Queen of France, he gladly went over to England with Sir Henry Wotton, the English ambassador. James I. received him with great distinction, and employed him in writing a confutation of Baronius. Casaubon was appointed prebendary of Canterbury and Westminster, and had also a pension of 300*l*. He died on the 1st of July 1614, and was interred in Westminster Abbey, where a monument was erected to his memory. His chief works are the following:—1. '*Strabo*,' with Commentaries, Geneva, 1587; reprinted with additions, Paris, 1620, fol. 2. '*Aristotelis Opera*,' with marginal notes, Geneva, 1605, fol. 3. '*Theophrasti Characteres*,' Lugd. 1592, 12mo; the best edition is the third, printed at Lyon in 1612. 4. '*Suetonii Opera*,' with an excellent commentary, Geneva, 1594, 4to; best edition Lutet., 1610, fol. 5. '*Athenæus*,' Lugd., 1600, fol.; Lugd., 1612, fol. 6. '*Persii Satyræ*,' Lutet., 1605, 8vo. 7. '*De Satyricis Græcorum Poetis*,' Lutet., 1605, 8vo. 8. '*Polybii Opera*,' Lutet., 1609, fol.; the dedication to Henri IV. is much admired. 9. '*Exercitationes contra Baronium*,' London, 1614, fol.

CASAUBON, MERIC, son of Isaac, was born at Geneva on the 14th August 1599. He was educated first at Sedan; then under a private tutor in England, whether he came along with his father, and in 1614 or 1616 he was sent to Christ Church College, Oxford, and elected student of that foundation. He took his degree of M.A. on the 14th June 1621, and in the same year published a defence of his father and the Protestant faith against the Catholics, entitled '*Pietas contra Maledictos Patris Nominis et Religionis Hostes*;' and three years afterwards he published another vindication of his father in Latin, written by the command of King James. Bishop Andrews presented him to the living of Bledon, in Somersetshire, in 1624. In 1625 Archbishop Laud made him prebendary of Canterbury and rector of Ickham; and in 1636 he was created D.D. by the University of Oxford at the command of Charles I., who was then residing at that university. The civil war deprived him of all his preferments, and he lived in retirement till the Restoration, notwithstanding many advantageous offers from Cromwell, who endeavoured in 1649 to induce Casaubon to write a history of the war, which he declined doing; and from Queen Christina of Sweden, who offered him the government of one of the universities of all the universities in her kingdom. At the Restoration he was restored to all his ecclesiastical preferments, and continued to employ himself in writing till his death, 14th July 1671. He was buried in Canterbury Cathedral. He had several children by his wife, whom he married in 1651, and who brought him a good fortune. His son John was a surgeon at Canterbury. His works, though numerous, are not of great value. In his book on

'*Credulity and Incredulity*' (London, 1668, 8vo; second part, London, 1670, 8vo), he maintained the existence of witches and familiar spirits.

CASES, LAS. [LAS CASAS.]

CASIMIR I., son of Miecislavus II., king of Poland, was a minor at his father's death in 1034. His mother Riksha, niece of the Emperor Otto III., assumed the regency, but the Poles being dissatisfied with her government, she was obliged to fly with her son into Germany, from whence Casimir proceeded to France, where he entered the Benedictine order of Cluni. In 1041 he was recalled by his subjects, who prevailed on the Pope Benedict IX. to absolve him from his vows, upon which he married Maria, sister of Jaroslaw, grand duke of Russia. Casimir defeated the Bohemians, and took Silesia from them. He founded a bishopric at Breslau. He did much to civilise the Poles, and he introduced among them his former brethren the Benedictines of Cluni. After a reign of eighteen years, he died in 1058, and was succeeded by his son Boleslas II., styled 'the Bold.'

CASIMIR II., younger son of Boleslas III., succeeded his brother Miecislavus III., who was deposed by the nobles for his tyrannical conduct in 1177. He defeated the Prussians, who were then heathens, and were very troublesome neighbours to the Poles, and he obliged them to adopt the Christian faith. He died in 1194, and was succeeded by his son Lesko V.

CASIMIR III., called 'the Great,' succeeded his father Wladislas in 1333. He conquered the Russians and annexed the greater part of their country to the crown of Poland: he also defeated the Bohemians. He married Anne, daughter of Gedemin, grand duke of Lithuania, and died in 1370, leaving no issue. In him the male line of Piast, which had held the crown of Poland since 820, became extinct. Lewis, king of Hungary, the son of Casimir's sister, succeeded him on the throne of Poland.

CASIMIR IV. was the second son of Jagello, grand duke of Lithuania, who married Hedwige, daughter of King Lewis, and thus became king of Poland under the name of Wladislas IV. Casimir succeeded to the crowns of Poland and Lithuania after the death of his brother Wladislas V., who lost his life in the battle of Varna against the Ottomans in 1444. Casimir made war against the Teutonic knights, and took from them a great part of Prussia; upon which the grand master of the order acknowledged himself a vassal to the crown of Poland. The duke of Wallachia also about the same time made allegiance to the Polish crown. It was under Casimir that the deputies of the provinces first appeared at the Diet of the kingdom of Poland. (Puffendorf.) This was the epoch of the greatest splendour of that country. Wladislas, son of Casimir, was made king of Bohemia and of Hungary. Casimir died in 1493, and was succeeded by his second son John Albert. It was Casimir who enforced the use of Latin as the official language of Poland.

CASIMIR V., son of Sigismund III., was elected king of Poland after the death of his brother Wladislas VII. in 1647. Casimir was then at Rome, where he had entered the church, and had become a cardinal. Having obtained a dispensation from the pope, he married Luisa Maria Gonzaga, his brother's widow. He made war against the Cossacks and against the Russians, with various success. Casimir was attacked by Charles Gustavus, king of Sweden, who overran a great part of Poland, and defeated the Poles in a great battle near Warsaw. By the peace of Oliva in 1660 Poland gave up Livonia to the Swedes, and Smolensk and Kiev to the Russians. Casimir, seeing his subjects dissatisfied, abdicated the crown in 1667. He retired to France, where Louis XIV. gave him the abbacy of St. Germain des Prés, and other benefices. He died at Nevers in 1672. Casimir V. was the last representative of the house of Jagello.

CASS, GENERAL LEWIS, was born at Exeter, New Hampshire, United States, in the latter part of the last century. He was educated for the law, but quitted that profession for the army, and having obtained a commission, served in 1812 in the expedition against Canada. He had not the fortune to be engaged in any actual encounter, but he was included in the army surrendered by General Hull to the English. Shortly afterwards he was released on an exchange of prisoners; rose rapidly to the rank of general of brigade, and had the charge of defending a portion of the frontier. After the cessation of hostilities he was elected governor of Michigan, in which state he had settled. In 1831 General Jackson appointed him secretary of war, an office which he subsequently exchanged for that of envoy extraordinary and minister plenipotentiary to France. Here he made himself conspicuous by various letters he published in the newspapers, and the publicity he gave to his somewhat strong opinions. His estimate, a very high one, of Louis Philippe and his policy, he gave to the world in a work entitled '*France, its King, Court, and Government*.' Disapproving of the foreign policy of President Harrison, General Cass resigned his office and returned to America, and immediately took a prominent part in the political proceedings of the States. He was understood to aim at the presidential seat, and he was put in nomination for the election of 1844, but was not returned by the convention. General Cass is now a senator for the state of Michigan; and takes a foremost place among the speakers in the senate. He belongs to what is termed the democratic party, and is noted rather for the passionate ardour of his partisanship than for the comprehensiveness or soundness of his judgment. He is a determined defender of the institution of slavery,

has always been a decided advocate for the extension of territory; and consequently strongly supported both the annexation of Texas and the war with Mexico; is anxious to maintain a high protection tariff; and has made himself especially notorious by the eagerness with which he has on every possible occasion joined in and stimulated the cry for war with England.

CASSANDER was the son of Antipater, to whom Macedonia was allotted on the division of the Macedonian empire after the death of Alexander. Antipater dying, B.C. 318, appointed Polysperchon to succeed him. [ANTIPATER.] Cassander bore this exclusion with indignation; but finding his party too weak for successful opposition, he fled to Asia, and sought the assistance of Antigonus and Ptolemaeus. Antigonus gave him 4000 men, with whom he sailed to Athens, and was received by Nicanor, the Macedonian governor of the port and fortress of Munychia, who had recently, by a sudden attack, obtained possession of the chief part of Piræus also. Polysperchon lost no time in conducting an army to besiege him, but was soon obliged, by scarcity of provisions, to draw off the greater part of his troops into Peloponnesus, leaving only an army of observation in Attica. Almost the whole of Peloponnesus favoured Polysperchon; Megalopolis however remained firm to the party of Cassander, and defended itself with such resolution that his rival was compelled to retreat from under its walls with mortification and disgrace. Parties were so balanced in Greece, that a slight thing was enough to turn the scale in favour of one or the other. "Polysperchon falling into disgrace through this failure (says Diodorus, xviii. 74), most of the Greek cities went over to Cassander;" and, among the rest, Athens, seeing no chance of recovering possession of its ports by force of arms, B.C. 317.

In the following year, Cassander marched into Macedonia against Polysperchon, who, with the view of strengthening his party among the Macedonians, had associated with himself Olympias, the mother of Alexander. Leaving Callas, his general, to oppose Polysperchon, Cassander himself blockaded Olympias in Pydna during the winter. That town yielded on capitulation early in the year B.C. 315, when Olympias, in express contravention of the terms of surrender, was put to death through his agency. Having now gained possession of Macedonia, with the power, though not the name, of a king, he took to wife Thessalonice, the daughter of Philip and half-sister of Alexander, in hope of confirming his own ascendancy by the powerful associations connected with the royal blood. In the same year he founded the flourishing city of Cassandria, in Pallene, which was formerly known by the name of Potidea, and commenced the restoration of Thebes, twenty years after its destruction by Alexander. Soon after he joined the combination of Ptolemaeus, Lysimachus, and Seleucus, against Antigonus. The war which ensued was concluded, B.C. 311, on condition, so far as related to Cassander, that he should be military governor (στρατηγός) of Europe, till the son of Roxana by Alexander should attain his majority. This limitation Cassander made of no avail by immediately putting to death both the young prince and his mother, B.C. 309. Polysperchon set up another rival to him, in the person of Hercules, the only surviving son of Alexander by Barsine; but he agreed to put Hercules to death on condition of Peloponnesus being given up to him. Hercules was accordingly murdered, but Polysperchon was not able to take possession of Peloponnesus, which was the stipulated price of his treachery.

No part of history is more complicated, and less interesting, than that which relates to the wars of Alexander's immediate successors. We therefore pass over the constant employment given to Cassander by the confirmed enmity of the Ætolians, and by the disturbances continually fomented in Greece by Antigonus.

During the Rhodian war [ANTIGONUS], Cassander regained much influence in Greece, which he had lost by the intrigues of Antigonus and the military successes of his son Demetrius. But after the siege of Rhodes was raised, Demetrius again repaired to Greece, and, in the year B.C. 302, became master of the greater part of Peloponnesus. The danger in which Antigonus was involved by the second confederacy of Ptolemaeus, Seleucus, &c., recalled Demetrius to Asia; and the death of Antigonus at the battle of Ipsus, B.C. 301, removed Cassander's most formidable enemy. From that time forwards, he held secure possession of Macedonia, though Demetrius retained considerable influence in Greece. He died B.C. 296 (Clinton), leaving the character of an ambitious, able, unscrupulous man, of whom the best that can be said is, that his rivals were no better than himself. He was succeeded in Macedonia by Philip, his eldest son.

CASSINI. We have now for the second time to sketch the lives and labours of a family of distinguished men, who, though their contributions to the stock of knowledge do not rival in extent or value those of the Bernoullis, present nevertheless a succession of talent and industry which rarely occurs. From the date of its establishment in 1670, till the time when the revolution destroyed all hereditary privileges, the Observatory of Paris passed from one Cassini to another through four generations, as though it had been transmitted by the law of property.

JOHN DOMINIC CASSINI was born at Perinaldo, in the district of Nice, June 8, 1625, of a respectable family which came from Siena, of which place a Cardinal Cassini was archbishop in 1426. He was educated by the Jesuits at Genoa, and there are some Latin poems of his in a collection of 1616. He attached himself to mathematics and

astronomy, and also it is said to astrology, of which he was cured by discovering that a prediction which succeeded had been calculated wrongly. He also read the work of Pico di Mirandola against astrologers. In 1644, at the invitation of the Marquis Malvasia, who was building an observatory, he removed to Bologna, and in the university of that place, after the death of Cavalieri, in 1650, he succeeded to the chair of astronomy. He here observed the comet of 1652, on which he published his first work. He made various observations with a gnomon and meridian line constructed in a church at Bologna. In 1657 he was deputed, with another, ambassador to the pope, on a quarrel between Bologna and Ferrara relative to the river Po, and on his return was appointed to the superintendence of the river for the former place. In 1663 he was appointed to repair the works of Fort Urban. He was at this time patronised by Pope Alexander VII., and afterwards by Clement IX. In 1664-5 he made the first of his more brilliant and useful discoveries, namely, the time of the rotation of Jupiter, which he fixed at 9 hours 56 minutes. Professor Airy, by recent observations, makes it 9 h. 55 m. 21.3 s. He also saw, for the first time, the shadows of the satellites on the disc. [CAMPANI.] By comparison of his own observations with those of Galileo, he constructed (1665) his first tables of the satellites. In 1666-7 he found the rotation of Mars to be 24 h. 40 m. (it is 24 h. 39 m. 21.3 s.), and in this same year he ascertained that the rotation of Venus, which is difficult to observe on account of her phases, does not differ much from that of Mars (it is 23 h. 21 m. 7 s.). He made the apparent rotation of the sun to be about 27 days, which is very near the truth. These results show considerable skill and assiduity, and made the name of Cassini very well known throughout Europe.

When Colbert founded the Academy of Sciences, in 1666, and at the same time projected an observatory at Paris, he proposed to Cassini to remove into France, and offered him a pension equivalent to his Italian emoluments. Cassini expressed his willingness to comply if the consent of the pope (Clement IX.) could be obtained; which was done on condition that Cassini's absence should not last more than two or three years. He arrived at Paris April 4, 1669, and began his duties at the observatory September 14, 1671, where his observations extend from 1671 to 1683. In 1673 the Bolognese government, which had kept all his appointments open, required him to return; but Colbert succeeded in negotiating his continued stay in France, and accordingly in the same year he was naturalised in his new country, and married a French lady. He never returned to Italy, except for a short time in 1695, but remained at the head of the Paris Observatory. In the latter years of his life he was totally blind. He died September 14, 1712, without disease, and only, as Fontenelle remarks, "par la seule nécessité de mourir." His eldest son was killed at the battle of La Hogue; of his second we shall have to speak as soon as we have completed the present part of our subject. In 1671-2 he discovered the third and fifth satellites of Saturn, and in 1684 the first and second. His gnomon at Bologna led him to more correct solar tables than had been in use, and to more exact values of the refraction. He gave a more complete explanation of the lunar libration than either Kepler or Hévelius, particularly in the determination of the quantities concerned; and though he did not leave the actual observations, Delambre, who, as we shall see, judges him severely, appears to think that he *did* establish by observation the coincidence of the nodes of the lunar equator and orbit. He was the first who carefully observed the zodiacal light, which he imagines he discovered. His later tables of the satellites of Jupiter (1688 and 1693) were considerable improvements; but though in possession of facts analogous to those which led to the discovery of the motion of light, he not only did not make that discovery, but rejected it when announced by Roemer. For his arc of the meridian, his observations relative to refraction, with a multitude of other points too long to notice here, we must refer to Delambre, 'Hist. d'Astron. Mod.,' vol. ii.

We have seen that Cassini, as an observer, was no ordinary man. Even if we leave out of view discoveries such as those of the satellites of Saturn, which though brilliant involve no extraordinary sagacity, we have still the continued, systematic, and successful observations of the satellites of Jupiter. But as a philosopher, and as a reasoner upon the results of his observations, Cassini does not excel. An obstinate follower of Descartes, we have no evidence that he ever looked into Newton; probably his mathematical knowledge was not sufficient to enable him to understand the 'Principia.' A devoted, if not a bigoted adherent of the Church of Rome, he was a Ptolemaist long after the time when Galileo had made the speculation of Copernicus sound astronomical doctrine; and we cannot give much admiration to the power of a mind which enslaves itself to a church in a matter of science. His unskilful handling of Kepler's laws, his crude and unsatisfactory notions upon comets, and indeed his method of dealing with almost any subject which involved investigation, are so many points which render the extravagant praises of Fontenelle and Lalande altogether inadmissible. His reputation in fact was altogether of a different species from that which it ought to have been. So far as that sort of notoriety is concerned with which the public in general is most struck, Cassini and William Herschel appear to resemble each other. Nevertheless, take from the latter Uranus and six satellites, with two of Saturn, and there is left a first-rate reputation among astronomers; withdraw the similar discoveries of Cassini

and he remains a commendable and even a remarkable observer, but by no means in his present rank. And it must be remarked that there is throughout Cassini's writings a continual tendency, either from ignorance or vanity, to appropriate the discoveries of predecessors or contemporaries. He speaks of himself as the first who observed the variation of the moon's diameter depending upon her altitude. "Où," says Delambre, in one of his parentheses, "le premier après Kepler, Azorius, et Hevelius." The summing up of this concerning Cassini is worth extracting. "But why, we may ask, has Cassini so universal a reputation? Why has he had more praise to his own share than all astronomers together, at least during their lives? Firstly, because there was in him much to praise, because he was industrious, because he kept public attention constantly awake, because he employed for the most part unusual means, such as his gnomon and his long telescope; and because, being invited to France as a man who could not be done without, the world early became accustomed to consider him superior to those who had wished him to join them. He was a conquest for which the monarch was praised, and all the degrees bestowed upon him went indirectly to the king. He attributed (almost homages) all his discoveries to Louis XIV.; he was the favourite astronomer of the court, so that it did not need as much as he had to secure him more reputation than any other. All the world understood Cassini's discoveries: Jupiter turned in 9h. 56m., Venus in 23h. 20m., Mars in 24h. 40m.; Saturn had four moons, which no one had seen till then, and a medal had been struck to commemorate the latter. In reality, these phenomena were isolated novelties, infinitely curious things, which all astronomers are very glad to know, but which could have been omitted without any result in the smallest degree prejudicial to the progress of real astronomy. If we feel authorised to reproach any one it is not Cassini, but his contemporaries." On the other hand, Lalande, an astronomer of real merit but of great want of judgment, has the following absurd exaggeration:—"Cassini was one of those rare men who seem formed by nature to give a new face to the sciences; astronomy, augmented and perfected in all its parts by the discoveries of Cassini, underwent in his hands a most astonishing revolution. This great man was the chief glory of the glory of Louis XIV. in this respect, and the name of Cassini is almost synonymous in France with that of the creator of astronomy." On which we can only say, may every Lalande find a Delambre!

The writings of Dominic Cassini are numerous, and a complete list may be found in Lalande's 'Bibliographie Astronomique.' It is a presumption, so far as it goes, of the accuracy of the character given by Delambre, that none of these writings are now sought after as containing matter of any lasting value, except only the pure results of observation.

JAMES CASSINI, son of Dominic, was born at Paris, February 18, 1677, and at seventeen years of age was thought of sufficient promise to be received a member of the Academy of Sciences. He accompanied his father to Italy in 1695, and afterwards travelled in England and Holland, where he became acquainted with Newton, Flamsteed, &c. He succeeded his father at the observatory, was *Maitre des Comptes*, and died April 16, 1756. He was proceeding to his estate of Thury, when the carriage was upset, and he became immediately paralytic.

There is not much of brilliancy in the results of the life of James Cassini as compared with those of his father, whom, on the whole, he much resembled in the character of his methods of observing and deducing. He was a better mathematician, and devoted himself for the most part to fundamental points of astronomy, and to the construction of tables. His separate writings are not numerous; some of them on optics by himself and his brother (afterwards killed as before stated) were published in 1691, being nothing but college exercises. The others are, 'De la Grandeur et de la Figure de la Terre,' Paris, 1729; and 'Éléments d'Astronomie,' Paris, 1740.

The first of these two works (a *culle* to the 'Mem. Acad. Sci.' for 1719) contains the account of the continuation of Picard's arc of the meridian, begun by Dominic Cassini and La Hire in 1680, and recommenced by Dominic and James Cassini in 1700. On the results of this measurement Dominic Cassini concluded that the earth was a spheroid elongated towards the poles, contrary both to theory and other observations. Much discussion was excited at the time. The second work is an elementary treatise, which seems intended to explain his own and his father's astronomy. It is accompanied by a volume of tables, which must be considered as the joint work of the father and son. This collection was republished when the original edition became scarce, but with so many errors of press as to diminish its value materially. The correct edition is that of the Imprimerie Royale, Paris, with the four-decays in the title-page. From this work we see that James Cassini seems biased, which is no great matter of surprise, in favour of his father, even to the extent of declaring that the hypothesis of the successive propagation of light, which all the world knew to belong to Roemer, was in fact started, examined, and rejected by Dominic Cassini. He cites the 'Memoirs of the Academy of Sciences,' which when examined by Delambre were found to contain nothing in support of the assertion, but showed very distinctly that Cassini and Roemer were in controversy upon the subject, and that nothing but the rejection of the hypothesis now known by the name of Roemer appears to have belonged to Dominic Cassini. It appears also that

James Cassini was rather Copernican in his notions, but not very strongly determined; that he knew nothing, or next to nothing, of the system and writings of Newton ('Principia,' 1687; J. Cassini's 'Astronomy,' 1740), which he cites in two places—once to endeavour to explain the acceleration of Jupiter's motion, in another for observations of a comet. He knows nothing of Bradley's discovery of aberration (1727-28); but Delambre has forgotten when he adds that he knew nothing of that of nutation, which was not published till 1747. He appears to be, like his father, a follower of Descartes, and also, like him, to prefer graphical methods to calculation. His ideas upon the theory of comets would have been much the better for the study of Newton. Nevertheless, as an observer, J. Cassini was distinguished. His determinations of the times of revolution of the five satellites of Saturn then known are very exact: he first observed the inclination of the orbit of the fifth (now the seventh) of them. He improved the methods and tables of refraction; determined very nearly the variation of the obliquity of the ecliptic, and the length of the year by comparison of a large number of equinoxes of his own and others. He left also a great number of good observations. Nevertheless, it is but justice to Picard and Roemer to remember, that both of the Cassinis put together, distinguished as they were, did absolutely nothing which can now bring them to the daily remembrance of the astronomer, though their fame has surpassed that of the re-inventor of the micrometer, and the inventor of the transit instrument.

CÉSAR FRANÇOIS CASSINI, son of James, was born at Paris, June 17, 1714. He is generally known by the name of Cassini de Thury, having been the first to take a territorial appellation from the estate acquired by his father or grandfather. He accompanied his father during his geodesical operations in 1733, and was received member of the Academy at the age of 21. He succeeded his father as director of the observatory and as *maître des comptes*, and died September 4, 1784, of small-pox. His most remarkable labour is the large triangulation of France, published in 1744, under the title of 'La Méridienne, &c., vérifiée, &c.,' Paris. He nearly completed the large map of France, of which his son presented 124 sheets to the National Assembly in 1789. He made a long succession of observations at the observatory; but these, though they would have done credit to Dominic Cassini, were too late of their kind. The time was past in which a descendant of the first two Cassinis could compete with the rest of the world by his hereditary means only. We must refer to Lalande's 'Bibliographie' for a list of his writings, and to Delambre ('Histoire de l'Astronomie xviii. Siècle') for detail upon his astronomical observations.

JOHN DOMINIC CASSINI, son of Cassini de Thury, and most commonly known by his title of Count, was born at Paris June 30, 1748, and died in the same city October 17, 1845. He is the first of his family who decidedly adopted the system of Newton, though the same may perhaps be said of Cassini de Thury, from some isolated passages in his writings. He was elected member of the Academy in 1770, in which year he published the account of a voyage made by order of the king for trial of the chronometers of Le Roy. He was employed in 1787 with Méchain and Legendre in the operations for the junction of the observatories of Paris and Greenwich by a chain of triangles. He made repeated endeavours to induce the government to re-establish the observatory upon a new footing and with large instruments. The National Convention, apparently with the desire to force him to resign, resolved in 1793 that the observatory should be placed no longer under the control of one person, but of four, who should take annual duty in rotation. Of the four the Count Cassini was one, and the other three were his own pupils. To this he refused to submit, and resigned his charge September 6, 1793. He received an order to quit the observatory in twenty-four hours, and in the following year was imprisoned for seven months. From that time he abandoned astronomy entirely, refusing either to take part in the great survey, or to belong to the Bureau des Longitudes, or to the Institute, though he entered the latter body under the empire. He fixed himself on his own estate, and devoted himself to the duties of the Council of his department.

ALEXANDER GABRIEL CASSINI, his son, the fifth of the name, was born at Paris May 9, 1784, and began an astronomical career at a very early age, but soon relinquished this pursuit for that of botany. He was a judge of the Cour Royale, and died of the cholera at Paris, April 16, 1832.

We have thus the history of the occupation of an observatory by the members of one family for 122 years, and in spite of the deserved reputation of all the observers in question for talent and assiduity, it must be asserted that the hereditary system did not succeed. Delambre remarks with some bitterness, that during the whole of the reign of the Cassinis not "one little catalogue of stars" issued from the national observatory. Picard had proposed the erection of large instruments, and the observation of right ascensions and declinations. To this Dominic Cassini was opposed, and in the usual course of things such an error would have lasted for his life, and would have been repaired by his successor. But when the first Cassini was followed by a second and a third wedded to the ideas of their common ancestor, there could be no improvement; and the consequence is that the observatory of Greenwich, for the same period, bears away the palm from that of Paris in actual use to astronomy. Had the National Convention adopted the sound ideas of Count Cassini the case might have been altered. The errors of his predecessors appeared to be fully known

to him, and had he been allowed to rectify them, it is probable that the fifth Cassini would not have abandoned the career of his ancestors; and we might have seen the observatory of Paris, such as it has been since the accession of Napoleon, still in the hands of the distinguished family who had connected their name with all its previous history.

CASSIODORUS MAGNUS (or, as some call him, **MARCUS AURELIUS**, who lived in the sixth century, was a man of letters, an historian, and a statesman. He was born at Scylacium, in the country of the Bruttii, probably about the year 470, though some date his birth ten years later. His father, also named Cassiodorus, was high in office under Odoacer and Theodoric; and he himself was early introduced to public life under Odoacer, and obtained the confidence of Theodoric, under whom he filled the offices of secretary and quaestor. By Theodoric's successors he was appointed master of the offices and praetorian prefect. Under the reign of Vitiges, about the age of 70, he retired from the world, and founded the monastery of Viviers, in Calabria, where he lived nearly to the age of 100 in devotional retirement, enlivened by the exercise of his mechanical ingenuity in the construction of water-clocks, dials, &c., the collection of a valuable library, and composition. He composed a history of the Goths in twelve books, which is only extant in the abridgment of Jornandes; and he caused the ecclesiastical histories of Socrates, Sozomen, and Theodoret, to be translated into Latin by Epiphanius, under the title of 'Historia Tripartita.' Twelve books of his letters are extant: the first ten consist of instructions relating to the service, and written in the name of Theodoric, and his successors, Amalasontha, Athalaric, Theodatus, and Vitiges; the last two consist of similar papers written in his own name. They extend from the year 509 to 559. He also composed a treatise 'De Artibus ac Disciplinis Liberalium Literarum,' upon grammar, rhetoric, logic, arithmetic, music, geometry, and astronomy; a treatise on orthography, an exposition of the psalms, and other religious works. He enjoyed a high reputation among his contemporaries for learning, eloquence, and talent; but his Latin is impure, and his style full of the conceits of the age. His last work, 'De Orthographia,' he states in his preface to have been written in his 93rd year. The best edition of his works is that of Gareit, Rouen, 1679, in 2 vols. fol., reprinted at Venice; which contains the abridgment of Jornandes and the 'Historia Tripartita,' with a life prefixed. There is also a life of Cassiodorus in French, by Sainte-Marthe. Paris, 1690. 12mo. As to the character of Cassiodorus, and the literature of his age, the reader may consult Schlosser, 'Universal Historische Uebersicht,' &c. iii. 4.

CASSIUS, AVIDIUS, was, according to Dion Cassius, a native of Cyrrhus in Syria, and the son of a rhetorician, Heliodorus, who was prefect of Egypt in the joint reign of Antoninus Pius and Marcus Aurelius. Cassius served in the Parthian wars (A.D. 162 or 165) under Lucius Verus, in which he defeated Volagesus, and took Seleucia and Ctesiphon on the Tigris. He also served on the Danube, probably about 166. He was subsequently appointed governor of Syria, and in 170 he went to Egypt to suppress an insurrection in the lower country which was excited by some fanatics. He succeeded in putting an end to the rebellion; but a few years after (in 175) he himself rebelled against the Emperor Marcus Aurelius, and proclaimed himself Emperor in the East. Cassius was assassinated in a few months, and his head was carried to Aurelius. The humane emperor lamented his death, and declared that he wished Cassius alive that he might upbraid him for his ingratitude. The family and children of Cassius were spared, but it is said that Commodus the son of Aurelius burnt alive all the then surviving members of the family of Cassius, on the pretence of a fresh conspiracy.

Dion Cassius, who loved a tale of scandal, says that Faustina the wife of Aurelius, being apprehensive that her husband would not live long, and considering the youth of her son Commodus, attempted to secure the interests of herself and her family by corresponding with Avidius Cassius, and urging him to proclaim himself emperor whenever he heard of the death of Aurelius, and take her for his wife. It is said that there was a report of the death of Aurelius, and that this was the immediate occasion of Cassius proclaiming himself emperor. It is also said that he was himself the author of the report of the death of Aurelius. The letters between Aurelius and his wife Faustina on the occasion of the rebellion of Cassius are probably not genuine. Vulcatius attempts to show from these letters that Faustina was not privy to the design of Cassius.

(Vulcatius Gallicanus, *Avidius Cassius*; Dion Cassius, lib. lxxi.; Tillemont, *Histoire des Empereurs*, vol. ii.)

CASSIUS, CAIUS LONGINUS, appears in history for the first time as the quaestor of Crassus, in the unfortunate campaign against the Parthians, B.C. 53. He foresaw the consequences of the expedition into Mesopotamia, and warned his general against it, but without effect. He commanded a wing of the Roman army in the battle where they were defeated; and in the retreat from Carrhae, discovering the treachery of the guides, he took his own course with 500 horse, whom he conducted alone out of that army safely back into Syria. Succeeding to the command of that province, he held out Antioch against the Parthians, inflicted a signal defeat upon their troops retreating from Antiochia, and drove them, for a time, across the Euphrates. Upon the arrival of the proconsul Bibulus, B.C. 51, Cassius returned to Rome, having acquired great credit by his conduct.

A break occurs in his history, until, after the battle of Pharsalia, B.C. 48, when we find him in Pompey's service, commanding a fleet in the Hellespont. There he had the opportunity of ending the war by taking Cæsar prisoner, who fell in his way accompanied by a very few ships; but instead of doing so, by some strange indiscretion or treachery, he obeyed Cæsar's summons to surrender, and passed over to his side. Again we hear no more of him until the conspiracy against the dictator's life, in which he was a principal; and he was chiefly instrumental in drawing M. J. Brutus, whose sister he had married, into the plot. He had shared in Cæsar's favours, having been appointed by him to a pretorship, and to the command of Syria. Of the latter Antony endeavoured to deprive him, and procured a vote of the people to transfer it to Dolabella. Cassius, who had passed into Greece with Brutus, no sooner heard of this than he hastened into Asia, and speedily collected forces, with which he mastered Syria, Phœnicia, and Judea; and he was on the point of invading Egypt, when letters from Brutus summoned him to return towards Europe, to make head against the triumviri. After conquering and plundering Rhodes (B.C. 42), he joined Brutus at Sardis, and the united army marching through Thrace into Macedonia, encountered Antony and Octavianus in the plain of Philippi. Cassius wished to avoid a battle as long as possible, being aware that the enemy must soon become straitened for provisions. But Brutus was eager to fight, and as the soldiery also began to murmur at what they called the cowardice of their generals, Cassius was obliged to yield. In the battle he commanded the left wing, and was opposed to Antony. Brutus in the right broke the troops of Octavianus, and drove them off the field; but pursuing his advantage too far, he exposed the flank of Cassius, who was then taken at disadvantage by his able antagonist, and compelled to quit the field. Thinking that all was lost, he put an end to his life. On hearing of his death, Brutus honoured him with the appellation of the "last of the Romans."

Cassius was esteemed one of the best generals of the age; his private character was good, though his temper was stern, and he professed a warm attachment to the republican cause. He has not escaped the imputation of being influenced by private enmity in his hostility to Cæsar; and the abrupt way in which he abandoned Pompey's cause is calculated to excite suspicions unfavourable to his character. In his philosophical opinions, he belonged to the Epicureans. See Cicero, 'Ep. ad Div.' xv. 19.

CASSIVELLAUNUS. [BRITANNIA, in GEOGRAPHICAL DIVISION.]

CASTAGNO, ANDREA DEL, a distinguished Florentine painter, sometimes called the Infamous, was born at Castagno in Mugello, near Florence, about the year 1409, and died aged about seventy-four. He was contemporary with Cosimo Roselli and Masaccio, and painted in a style which in some respects resembled the styles of both masters, but he always remained far behind Masaccio, though he survived him many years. He was the first Florentine painter to adopt the new method of oil painting, which he learnt from Domenico Veneziano, and whom, after he had mastered the secret, he basely murdered. [VENEZIANO, DOMENICO.] Very few of Castagno's works still remain: there are three in the gallery of the academy of Florence, of which 'St. Jerome in the Desert' is a work of great merit for its period; there are also two or three of those noticed by Vasari, in religious buildings of Florence. In 1473, the Pazzi and other conspirators concerned in the murder of Giuliano de' Medici, were all painted by Castagno hanging by the feet on the façade of the palace of the Podestà; they were done with such ability, and in such a variety of attitudes, that Castagno was thenceforth called Andrea degli Impiccati (of the hanged). It was his best work, but it has long since perished. (Vasari, *Vite de' Pittori*, &c.; Baldinucci, *Notizie dei Professori del Disegno*, &c.)

CASTALION or CHASTEILLON, SEBASTIAN, was born in Dauphiné, some say in Savoy, about 1515. He applied early to the ancient languages, and became a great proficient in Greek and Hebrew. Being at Strasbourg in 1540-1, he made the acquaintance of John Calvin, who invited him to Geneva, and had him appointed to a chair in the college of that city. After two or three years, Castalion having become obnoxious to Calvin on account of some of his opinions, which were not in accordance with Calvinistic orthodoxy, especially on the subject of predestination, left Geneva for Basel, where he employed himself in teaching Greek and in writing several works, chiefly on Scriptural subjects. He wrote 'Psalterium reliquaque sacrarum Literarum Carmina et Precationes,' 1547, with notes; 'Jonas Prophetæ, heroicæ carmine Latino descriptus'; 'Dialogorum Sacrorum ad linguam et mores puerorum formandos, libri iv.' This last work has been translated into English by Dr. Bellamy, under the title, 'Youth's Scripture Remembrancer, or Select Sacred Stories by way of familiar Dialogues, in Latin and English, with a short Application of each Story,' London, 1743. He also published a version in Latin verse of the Sibylline Books, with notes, and a Latin translation of the 'Dialogues' of Bernardinus Ochino. Before he left Geneva he had undertaken a complete Latin version of the Bible from the Hebrew and Greek, which he completed at Basel, where it was published in 1551, and dedicated to Edward VI. of England. He published a French version of the same in 1555. Castalion's versions were made the subject of much conflicting criticism. His Latin Bible went through several editions; that of Leipzig, 1697, contains also his 'Delineatio

of his favourite Finnish mythology, and he was remarkably successful. Soon after his return, in 1841, he published, at Helsingfors, a translation into Swedish, in the metre of the original, of the great Finnish poem 'Kalevala,' the discovery of which by Dr. Lönnrot, who first noted part of it down from the lips of the peasantry, has made an epoch in the history of Finnish literature. It was this translation that first brought the poem into general notice; and, certainly, since Maspherson's 'Omian,' no discovery of the kind, real or supposed, has produced an equal sensation. 'Hiawatha,' the recent poem of Professor Longfellow, though purporting to be an embodiment of the traditions of the North American Indians, is borrowed from the 'Kalevala' in its general style, in its peculiar metre, and even in some of its more prominent passages. Soon after its publication Castrén set out on his third philological journey, which appears to have been made in its outset at the expense of Dr. Lönnrot, and afterwards at that of the Russian Academy of Sciences. It took him first to his old quarters at Enari, then to Kola, the capital of Russian Lapland, and finally to the Samoyeds on the coast of the White Sea. Here, with only fifteen rubles to keep him from starvation, he struck up an acquaintance with some of the savage Samoyeds, or cannibals, one of whom for an occasional glass of brandy undertook to teach him the Samoyed language; and in the hut of this man he passed nearly the whole of a summer, engaged in the study. Towards the end of his travels, which lasted four years, from 1845 to 1849, he crossed the Tundra, or deserts of European Russia, between the White Sea and the Ural, where not even the rein-deer can front the wintry blast and live. Philology has its martyrs as well as religion. Castrén returned with his constitution ruined.

While on his travels he had written most interesting and animated letters descriptive of his adventures and discoveries, which were printed in the 'Suomi,' an excellent periodical in the Swedish language published at Helsingfors. Many communications from him on learned subjects, chiefly written in German, appeared at the same time in the 'Bulletin of the Academy of Sciences' at St. Petersburg. On his return his name was universally known as that of a philologist of the first rank, but it was not till March 1851, on the occasion of a visit of the Grand Duke Alexander, the present Emperor of Russia, to the University of Helsingfors, that he was raised from the position of a 'privat-dozent,' or private tutor, to that of professor of the Finnish and old Scandinavian languages. One of his duties was to deliver a course of lectures on Finnish mythology, which he immediately commenced composing, but before they could be finished he was no more. He died at Helsingfors on the 7th of May 1852, from the effects of his Samoyed journey.

The translation of the 'Kalevala,' and some of Castrén's other works, have been already mentioned. His lectures, 'Vorlesungen über Finnische Mythologie,' were published in German at St. Petersburg in 1853 under the editorship of Schiefner. A German version of his travels by Helms was published at Leipzig in 1853, and analysed at some length in the 'Quarterly Review.' His other works were mostly of a philological character:—'Elementa Grammaticæ Toheremissæ,' Kämpis, 1845, 8vo; 'Elementa Grammaticæ Syriacæ,' Helsingfors, 1846, 8vo; 'In octavo pædagogibus linguarum Alticarum,' Helsingfors, 1850, 4to. There is also an Ostiak Grammar in German, forming a portion of a work called 'Nordische Reisen und Forschungen,' which was commenced at St. Petersburg in 1849. It need hardly be added that all these works are of the highest value to those who take an interest in what is called the Ugrian family of languages, comprising the Finnish, the Hungarian, the Syriacian, and other dialects scattered over the surface of European Russia, to investigate which was the object of Castrén's devoted exertions. It is much to be regretted for the sake of learning, as well as on other accounts, that he was snatched away before he had time to communicate to the world the results of his countless and ingenious labours.

CASTRUCCIO CASTRACANI was born at Lucca about the year 1283. His family name was Interminelli, but he assumed that of Castracani on his adoption into the family of that name, which was one of the principal of Lucca. When he was twenty years of age he visited England, where some of the Interminelli, who had been exiled from Lucca as Ghibelines, had settled, and had acquired wealth by trade. Castruccio was admitted into the court of Edward I., and served in the armies of that prince, but having killed in a quarrel a nobleman of the court, he was obliged to leave England for Flanders where he served under Philip le Bel, king of France, and greatly distinguished himself by his valour and abilities. About 1313 he returned to Italy, and joined the Ghibelines of Pisa, whom he assisted in expelling the Guelphs from Lucca. But Ugucione della Faggiuola, the leader of the Pisans and a soldier of fortune, having made himself tyrant of both Pisa and Lucca, threw Castruccio into prison. In 1316 on the march of both Pisa and Lucca drove away Ugucione, and the citizens of St. Lucia, having liberated Castruccio, proclaimed him chief of their republic. He was young, handsome, and brave, clever and unscrupulous, and he strengthened himself in his place by removing, by fair or foul means, all those who were ill-disposed towards him.

He then attacked Florence, which was the stronghold of the Guelph party in Italy. He took Pistoja and completely defeated, at Alto Pisto, the Florentine army under Raymond of Cardona, a Catalanian

mercenary chief, in September 1325. He then joined the other Ghibeline leaders in inviting the Emperor Louis of Bavaria to march into Italy and complete the subjugation of the Guelphs. The emperor came, and Castruccio became his chief adviser. In 1327 Louis reduced Pisa, and then proceeded with Castruccio to Rome, which he entered by force, and was crowned in the Vatican by the bishops of Venice and Aleria in January 1328, notwithstanding the excommunications of the pope John XXII. Castruccio was made Count Palatine. He had already been acknowledged by the emperor as Duke of Lucca, Pistoja, Volterra, and Lunigiana. He aimed at uniting all Tuscany under his sway, and establishing at the same time the supremacy of the emperor over all Italy, according to the principles of the Ghibeline party. While at Rome he received intelligence that the Florentines had surprised Pistoja, upon which he immediately returned to Tuscany, and on his way made himself master of Pisa, and besieged and took Pistoja, notwithstanding all the efforts of the Florentines to relieve the place. His exertions during the siege brought on an illness of which he died, 3rd of September 1328, at forty-five years of age. His death relieved Florence of one of its most dangerous enemies, and gave at the same time a fatal blow to the Ghibeline party in Italy. His children were driven away from Lucca in the following year. Castruccio is admitted by Italian historians to have been one of the few Italian chiefs of the middle ages whose ideas soared beyond the narrow circle of municipal ambition, and who entertained enlarged views for consolidating all Italy into one system. His military tactics, the secrecy of his plans, and the quickness of their execution, are also highly extolled. The life of Castruccio by Machiavelli is more a romance than a real biography. Aldo Manuzio the younger has written 'Le Attioni di Castruccio Castracani, Signore di Lucca,' 4to, Roma, 1590, a good work. Tegrini di Lucca has written the life of Castruccio, Modena, 1496, and Paris, 1546: it is also printed in vol. xl. of Muratori, 'Rerum Ital. Scriptores.' Sismondi, 'Histoire des Républiques Italiennes,' a work however decidedly hostile to the Ghibelines in general, may be consulted.

CATHARINA I., of Russia. [PETER THE GREAT.]

CATHARINA II., ALEXIEWNA, born in 1729, was the daughter of the Prince of Anhalt Zerbst, governor of Stettin in Prussian Pomerania. Her name was Sophia Augusta von Anhalt. She married in 1745 her cousin Charles Frederic, duke of Holstein Gottorp, whom his aunt the empress Elizabeth of Russia had chosen for her successor, having made him Grand Duke of Russia. In adopting the Greek communion he took the name of Peter, afterwards Peter III., and his consort that of Catharina Alexiewna. It was an ill-assorted and unhappy match. Catharine was handsome, fond of pleasure, and at the same time clever, ambitious, bold, and unprincipled. Her husband, although not destitute of good qualities, was greatly inferior to her in abilities, and was irresolute and imprudent. In consequence of many disagreements with his wife, as soon as he came to the throne by the death of the empress Elizabeth, he talked of repudiating Catharine, who was then living in retirement at Peterhof, a country residence near St. Petersburg. She on her part determined to anticipate him by a bolder movement. A confederacy was formed in which several noblemen, officers, and ladies joined; the regiments of the garrison were gained by bribes and promises; the emperor was arrested, and Catharine was proclaimed sole empress of all the Russias, Peter having been induced to sign an act of abdication in July 1762. Six days after, the principal conspirators, fearing a reaction in the army which might prove fatal to them, went to Ropcha, where Peter was kept in arrest, and while drinking with him, fell suddenly upon him and strangled him. It does not appear that Catharine actually ordered the murder; but after it was done she showed no sorrow, and she continued her favour to the murderers. In a proclamation which she issued it was said that the emperor had died of the colic. Catharine was solemnly crowned at Moscow in 1762. We shall not enter on the profligacy of her subsequent private life, and the scandalous chronicles of her court: these matters have been treated with the utmost minuteness by most of her biographers, and especially by Castern. We shall here speak not of the woman but of the sovereign, and record the principal acts of her long reign, which was a most important one for Russia and for Europe. In 1763, on the death of the weak and indolent Augustus III., king of Poland, that country being in a state of exhaustion and confusion, Catharine, by bribing part of the electors and terrifying the rest, procured the election of one of her favourites, Poniatowski, who was chosen king under the name of Stanislaus Augustus. Having accomplished this, she began to interfere in the internal concerns of that kingdom, whose wretched constitution, with its elective crown, turbulent nobility, servile population, and intolerant clergy, afforded her ample opportunities. In fact, some of the parties in Poland courted her support, as they had been in the habit of courting that of her predecessors and of the other neighbouring states for ages before.

The Dissidents of Poland, which was the name given to those who did not follow the Roman Catholic religion, including both Protestants and followers of the Greek Church, were placed upon an equal footing with the Catholics by the Pacta Conventa of 1573, confirmed by the treaty of peace of Oliva in 1660. Since this last epoch however, the Catholics, being the majority among the high nobility, had gradually excluded the Dissidents from the Diet, and annoyed them in other

ways. Early in the 18th century the Dissidents applied to Peter the Great, who remonstrated in their behalf, and obtained by his influence more equitable treatment for them. After Peter's death the Polish Dissidents were again deprived of their political and civil rights; they were excluded from all public offices, were forbidden to build any new church, and many of them were exiled or otherwise persecuted. In 1764, Russia, Prussia, England, and Denmark, as guaranties of the peace of Oliva, remonstrated with the Diet, but to no purpose. In the session of 1766 the Dissidents were finally subjected to the jurisdiction of the Catholic bishops. In the following year they formed an association, which was called the Confederacy of Thorn, for their common protection, and they were joined by a party of Catholics, who were called Malcontents, upon political grounds, and who now advocated the claims of the Dissidents. The Dissidents were also strongly supported by Russia, the population of which being chiefly of the Greek Church felt a lively interest in the fate of their co-religionists, who were very numerous, especially in the east provinces of Poland. In 1768 Russian troops entered Poland and surrounded Warsaw. Several members of the Diet, and the Bishop of Cracow among them, who were most violent against the Dissidents, were arrested by the Russians and sent into Siberia, where they remained five years. The Diet, being now intimidated, granted the full claims of the Dissidents; but several Catholic noblemen, especially on the south provinces bordering on Turkey, raised the standard of revolt on mixed religious and political grounds, and a civil war ensued, in which the king's troops were defeated. The king and senate at Warsaw petitioned the Russian minister not to withdraw the Russian troops on this emergency, a request which was readily complied with. The insurgents on their part applied to the Turks for assistance; and a war between Turkey and Russia (1769) was the consequence. During four years Poland was ravaged by civil and religious war, and a dreadful pestilence in 1770 completed the miseries of that country. The result of all this was the first partition of Poland, concerted between Catharine, Frederic of Prussia, and Joseph II. of Austria, which was effected in 1772, and was sanctioned by a subservient Polish Diet. More than one-third of that kingdom was divided among the three powers. Russia had for its share the governments of Polotsk and Mohilow, which include a great part of Lithuania and Livonia. Meantime the war with the Turks had proved highly successful to the Russian arms both by sea and land. Romansow defeated the Turks on the Pruth, and the Russian fleet in the Mediterranean defeated and burnt the Turkish fleet at Tchesme in 1770. By the peace of Kainarji, July 1774, Azof and Taganrog were ceded to Russia, and the Crimea was declared independent of Turkey. Not many years after, the Russians took the Crimea for themselves (1785), and made it a province of their empire. In January 1787, Catharine set off from St. Petersburg with great pomp to visit her new acquisitions. Her journey was like a triumphal procession. She was joined on the road by the emperor Joseph II., who accompanied her into the Crimea, where they concerted measures for a joint war against Turkey. At Cherson, on the Dnieper, she inspected the docks constructed by her orders, and saw a ship of the line and a frigate launched. Soon after, the Turks and the Swedes, at the instigation of France and England, declared war against Russia. The object of this war was to check the progress of Russia, but the result was quite the contrary. The Turks were defeated everywhere: they lost Oczakow; Suwarrow took from them Ismail by storm in 1790, with a dreadful massacre of the garrison; and another Russian army entered Georgia. By the peace of Yassi, in 1792, the frontiers of Russia were extended to the Dniester. The war between Russia and Sweden had been already concluded by the peace of Wæres in 1790. Meantime the Poles, taking advantage of the war, had shaken off the influence of Russia, and abrogated the articles of the Diet of 1775, which had been dictated by Catharine. In 1791 they formed a new constitution, making the crown hereditary, giving greater privileges to the royal towns, and favouring in some degree the emancipation of the peasants or serfs. But this constitution was far from being acceptable to all the nobles; many protested against it, and so did Catharine of Russia, as guarantee of the former constitution. Prussia joined Catharine: and the result was a second partition of Poland in 1793, by which Russia took the whole of Lithuania, Volhynia, and Podolia; and the King of Prussia obtained Posen, Gnesen, and the towns of Danzig and Thorn. In 1794 an insurrection broke out at Warsaw, the Russian garrison was almost entirely destroyed, and the gallant Kosciusko placed himself at the head of the Poles, who fought with the courage of despair. After being successful at first, he was defeated, wounded, and taken prisoner. Suwarrow stormed Praga, the suburb of Warsaw, with a dreadful slaughter of the inhabitants. Warsaw surrendered, the king abdicated, and the third and last partition of Poland took place in 1795. Austria had Galicia, Prussia took Warsaw, and Russia the rest. Poland thus became extinct as a state. Catharine finally annexed Courland also to the Russian empire.

Catharine began now to turn her attention towards France, and had promised to send troops to join the coalition against that country, when, on the 17th of November 1796, she died of an apoplectic fit, after a reign of thirty-five years. She was succeeded by her son Paul I.

In the internal administration of her vast empire Catharine effected

much real and more seeming good. She reformed the judicial system, which was in a most confused state; organised proper courts, and gave better salaries to the judges, in order, as she publicly told them, that they might be placed above temptation. She to a certain extent ameliorated the condition of the serfs or peasants. She encouraged instruction, established schools in all the provinces, schools for teachers after the model of those of Germany, and numerous special or higher schools for the military and naval services, for the mining establishment, for the study of medicine and surgery, for oriental languages, &c. She also sought to promote communication and commerce between the various countries subject to her sway and with foreign states. She has been called the great regenerator of Russia after Peter I., and she worked under more favourable circumstances. She began several canals, among others the one called Severo Jekaterinski, which uniting the Volga to the Dwina, effects thus a communication between the Caspian and the White Sea. She founded numerous towns, docks, arsenals, banks, and manufactories. She employed several learned men, among others Pallas, Falk, Gmelin, Blumayer, Billings, and Edwards, to explore the interior and the remotest parts of her empire. Her peculiar patronage of the arts and literature, and the favour she showed to D'Alembert, Diderot, Euler, &c., are well known. Her correspondence with Voltaire has been published, and forms half a volume in the collected edition of Voltaire's works. She compiled also a 'Bibliothèque d'Histoire et de Morale' for the instruction of her grand-children Alexander and Constantine. But the most remarkable of her works is her 'Instructions to the Commissioners appointed to frame a new Code of Laws for the Russian Empire,' which were translated into English by M. Tatishcheff, London, 4to, 1768. For details concerning her administration, see Tooke's 'History of the Reign of Catharine II.,' Count Segur's 'Mémoires,' and Rulhière's posthumous works.

CATHARINE OF ARAGON. [HENRY VIII.]

CATHARINE OF BRAGANZA. [CHARLES II.]

CATHARINE PARR. [HENRY VIII.]

CATHARINE DE' MEDICI was the daughter of Lorenzo de' Medici, duke of Urbino, the son of Piero, and grandson of Lorenzo the Magnificent, and nephew of Leo X. Her mother Magdeleine de Boulogne, of the royal house of France, died in giving birth to Catharine, her only child, in 1519. Her father died soon after, and Catharine was brought up under the care of her great uncle Cardinal Giulio de' Medici, afterwards Pope Clement VII. She was remarkably handsome, clever, and accomplished, but crafty, proud, and unprincipled. In 1533 she was married to Henri, second son of Francis I. of France. It was a political marriage, contracted between the pope and the king, who met at Marseille on that occasion. In 1547, Henri having ascended the throne upon the death of his father and elder brother, Catharine became queen of France. Her influence at court was not very great during the reign of her husband, it being checked by that of his mistress, Diana of Poitiers, and that of the powerful family of the Guises. Catharine had by her husband five sons, of whom three reigned successively over France—Francis II., Charles IX., and Henri III. During the short reign of Francis II., who succeeded Henri II. in 1547, the chief influence at court was in the hands of the Guises, whose niece Mary Stuart had married Francis II. But when by the premature death of this young prince in 1560, his brother Charles IX., then a minor, ascended the throne, Catharine as regent became the real ruler of France, and remained its ruler after her son had attained his majority. She is therefore accountable for all the mismanagement, corruption, and atrocities of that calamitous reign, and, above all, for the treacherous massacre of the Protestants in August 1572, which is known by the name of La Sainte Barthélemy, because it was perpetrated on the day dedicated to that saint by the Roman calendar. The king of Navarre (afterwards Henri IV.) luckily escaped, and the Protestants defended themselves in several parts of the kingdom, so that the civil war raged again as fiercely as ever. Charles IX. died in 1574, leaving the state in dreadful confusion. His brother, Henry of Valois, was then in Poland, where he had been elected king by the Diet. As soon as he heard of his brother's death, he left Poland in secret, and returned to France, where he was crowned in 1575. Henri III. was, like his brother, a weak and corrupt prince. Catharine had brought up her sons purposely in licentiousness and effeminacy, in order that she might more easily govern them. The reign of Henri III. was distracted by the intrigues of his favourites, of the queen-mother, and of the Guises; by the civil wars between Protestants and Catholics, and by the war between France and Spain. Catharine, according to her usual policy, favoured sometimes one party and sometimes the other, for fear that any one of them should become too powerful for her to manage. At last assassination was resorted to again in order to get rid of the Guises. The Duke of Guise and the cardinal his brother were murdered at Blois in December 1588, by order of the king. On the 5th of January 1589, Catharine herself died at Blois, an object of aversion to all parties. She was one of the worst sovereigns that ruled over France since the times of the Merovingian dynasty. Even her ambition was not of an enlarged kind; it was narrow, wavering, treacherous, and undecided, and it led to no final result. The country was in a state of greater confusion at her death than it had been at any time during her sway; the monarchy was near its dissolution, and it required all

the address and the brilliant qualities of Henri IV. to rescue it from total ruin. Catharine had only one redeeming quality—her love for the arts and literature, which seems to have been hereditary in the family of Medici. She collected valuable manuscripts, she encouraged artists, and she began the palace of the Tuileries. She was proud in her expenditure, and died much in debt. (De Thou, Sully, Girardot, and the other French historians and biographers.)

CATILINA, LUCIUS SERGIUS, descended from an illustrious patrician family, was born about B.C. 109. Catiline was quaestor about B.C. 77, and afterwards served as legate to Scribonius Curio, proconsul of Macedonia, B.C. 76. He was praetor at Rome, B.C. 67. At the expiration of his praetorship, he obtained the province of Africa, which he left to canvass for the consulship; but he was obliged to give up his canvass in consequence of being accused of malversation in his province. During this year, B.C. 65, he formed a conspiracy with Cn. Piso and P. Antonius to assassinate the consuls and part of the senate. Suetonius says that Cn. Crassus and M. Crassus were engaged in this plot, and cites as his authorities Tannius Geminus, the edicts of Bibulus, the orations of the elder Curio, and Aetorius Naso. (See also Cic. in "Catil." 4.) The plot was frustrated at first by the backwardness of Crassus and Caesar, and a second time by the hastiness of Catiline. Having procured an acquittal on his trial (B.C. 65) for maladministration in Africa by bribing the judges, and, it is said, the prosecutor, P. Clodius, also, he was a candidate for the consulship with Cicero for the year B.C. 63. During the contest he was tried with many others for the murders which he had committed during the proscription of Sulla, to whose party Catiline belonged, and especially for that of Marcus Gratidianus, uncle to Cicero, but, through the influence of the consular senators, he was acquitted. According to some, this murder, which was committed many years before, in addition to the imputed seduction of Fabia, Cicero's sister-in-law, laid the foundation for that animosity with which Cicero afterwards pursued Catiline. Yet Cicero says ("Ad. Att." i. 2) that he had some thoughts of defending him on his trial for malversation.

In the beginning of June, B.C. 64, about a month before the consular election, urged by the ruined state of his fortunes, Catiline held the first meeting of his second conspiracy, eleven men of senatorian rank and four of equestrian being present. Some rumour of their proceedings got abroad, and Catiline lost his election; while the previous preparations of Cicero prevented the execution of a design which Catiline had formed to kill the consul and other senators on the day of election. Notwithstanding this failure, Catiline still pushed forward his designs with great vigour. Money and arms were collected, and Manlius, one of Sulla's veterans, only waited Catiline's orders to take the field with a large body of his comrades, who, after Sulla's victories, had been settled in different parts of Italy. Information of all their proceedings was conveyed to Cicero, and by him communicated to the senate, who, on the 21st of October, issued the decree in the usual form (*Darent operam, &c.*), which gave dictatorial power to the consuls. On the 6th of November, another meeting of the conspirators was held, at which arrangements were made for firing the town and massacring the inhabitants, for the bringing up the Tuscan army under Manlius, and for the murder of Cicero, all which was reported the same evening to Cicero. Catiline still kept up the appearance of innocence, and though impeached by L. Paulus under the *Maianian* law, came down to the senate, which was assembled by Cicero on the 8th of November. When Cicero concluded, Catiline, in a humble voice and manner, began to defend himself, but was interrupted by the senate calling out that "he was an enemy and a traitor to his country." Catiline abruptly left the senate-house, and set out the same night for the camp of Manlius, with the view of making some decisive movement before the consuls could get an army together to oppose him. The senate immediately declared him and Manlius enemies to the state, and ordered the consuls to raise new troops, of which the command was given to C. Antonius, the colleague of Cicero. Q. Marcius Rex and Q. Metellus Creticus were at this time waiting with their armies outside the gates for the honour of a triumph. It being reported that the slaves were arming in Apulia and Capua, Metellus was despatched into Apulia, and Marcius to Fesulae, where Manlius was encamped. A remonstrance, addressed to Marcius by Manlius, setting forth their grievances, was answered by a reference to the senate, but it does not appear that any engagement took place. Up to this time, Catiline made little progress, in consequence of his plans being regularly divulged, through the mistress of one of the conspirators, to Cicero, and his designs were consequently thwarted; while, on the other hand, the prospect of the conspiracy being crushed seemed equally distant.

A high reward which had been offered by the senate for information respecting the plot had produced no evidence, and it appears certain that a large proportion of the population (Sallust says the whole of the common people) approved of Catiline's design; but how far they were desirous of change from the hope of plunder, and how far from a well-grounded dissatisfaction with the government of the senatorian clergy, it would be a difficult matter to determine. The senate certainly did not appeal to the people for support against a common enemy. An unsuccessful attempt of the remaining conspirators to draw into the plot the ambassadors of the Allobroges, at that time in Rome, and to obtain from them a body of horse, furnished the consul

with evidence against the principal conspirators. Lentulus, Gabinius Statilius, and Cethegus were arrested. Fresh plots were now rumoured to be hatching among the dependents of the conspirators for their rescue; and after a long debate in the senate on the 5th of December (Nona Decembris), in which Caesar argued against and Cato in favour of the capital punishment of the conspirators, they were condemned to death without the form of a trial, and executed accordingly. Catiline now found himself hemmed in by Metellus Celer on the side of Cisalpine Gaul, and by Antonius, now proconsul, with a superior force among the Apennines. He made a desperate attack on the troops of Antonius, which were under the command of M. Petreius, was defeated, and fell among the thickest of the enemy, fighting bravely to the last, B.C. 62.

The history of Catiline's conspiracy is chiefly transmitted to us by Cicero and Sallust, and we have only one side of the story. Though there is doubtless great exaggeration in both these writers, and though it seems impossible to penetrate the whole design of Catiline, there is not much difficulty in forming a general opinion of this plot. The civil wars of Marius and Sulla, which terminated in favour of Sulla, led the way to an organised system of murder and plunder, of which few histories present so frightful an example. The partisans of Sulla were enriched by the proscription and robbery of their fellow-citizens. This was the school in which Catiline and many of his accomplices were brought up. A body of profligate young men of rank, overwhelmed with debt, whose only pursuit is pleasure, are the readiest elements out of which to form a conspiracy. The conspiracy of Catiline was a conspiracy of an aristocratic faction against the body of which it formed a part—a body that had its own interested views and exclusive objects, but preferred accomplishing them in a more politic and less violent way. If the conspirators had succeeded they would, as a matter of course, in following up the example of Sulla, have crushed the whole aristocratical party whose views were opposed to their own. The possession of all the influence in the state—the spoliation of their wealthy enemies—would have been the reward of the partisans of Catiline; but it is difficult to conceive that any one useful result to the state would have followed; and, in the absence of better evidence as to the character and abilities of the conspirators, it is impossible to conclude that Rome would have been fortunate enough to find among them a master who possessed the wisdom and moderation of the dictator Caesar.

CATO, that is, the Wise, was a surname given to MARCUS PORCIUS PRISCUS. This extraordinary man, commonly called Cato Censorius, or Cato Major, to distinguish him from his descendant who fell on his sword at Utica, was born in the year B.C. 234. He was descended from a respectable family in Tusculum, and passed his earlier years on a farm in the Sabine country, which he inherited from his father. At the age of seventeen a Roman necessarily became a soldier, and Cato's military career commenced in the very year when Hannibal was laying waste the north of Italy after the battle of the Trebia, B.C. 217. We find him afterwards serving under the command of Fabius, at the capture of Tarentum, in B.C. 209; and two years after he distinguished himself at the memorable battle on the banks of the Metaurus, which was fatal to the brother of Hannibal. In private life he maintained the same character for hardness, industry, and sobriety which he had earned in the military profession. Occupying a farm adjoining that which had once belonged to Curius Dentatus, he seemed to take that old Roman for a model, and drew upon him the attention of the neighbouring farmers, not more by the simplicity of his habits than by the plain good sense of the laconic maxims which fell from his lips and became current in the neighbourhood. His singular reputation obtained him the name of Cato, and at length attracted the observation of a young Patrician, named L. Valerius Flaccus, who, looking upon him, to use the language of Plutarch, "as a plant that deserved a better soil," persuaded him to remove to Rome, and to offer himself for the public magistracies. With this friend, who thus introduced him to the Roman public, he afterwards held the highest posts in the state, the consulship and the censorship. The first step in the series of Roman offices was the quaestorship. This office he filled in B.C. 204, and was appointed to join the army in Sicily, which Scipio was about to carry across into Africa; but the profuse expenditure of the general offended those notions of strict economy which belonged to the character of Cato. The quaestor returned to Rome, and taking his seat in the senate, to which he was entitled by right of his office, he denounced the conduct of Scipio as fatal to the discipline of the army. Soon after we find him, according to Nepos, acting as quaestor in the island of Sardinia, where he became acquainted with Ennius. It is more probable that the acquaintance with Ennius was formed when Cato was in Sardinia as praetor. The errors of Nepos, or rather of the writer, whose works are ascribed to him, are innumerable. Cato, with all his rustic character, was a friend to literature, and it was he who first brought the Calabrian poet to Rome. After holding the plebeian edileship and the praetorship, in the latter of which he was the governor of Sardinia, he finally arrived at the consulate, which he filled in B.C. 195, the year of Terence's birth, having his friend Valerius for his colleague. At that period of the Roman commonwealth it was usual for the consuls to hold commands at a distance from Rome. Cato was appointed governor of Nearer Spain, where the vigour of his arms and the policy of his

counsels added greatly to the Roman influence, and procured him the honour of a triumph in the following year. He had now attained to the summit of military glory, but his zeal was not fatigued. The new consul, Tiberius Sempronius, being despatched on an expedition against the Thracians and the neighbourhood of the Danube, Cato accompanied him as one of his lieutenants.

When Antiochus invaded Greece, we find Cato again in military employment in the Peloponnese, securing the fidelity of Corinth, Ægium, and Patræ; and in 191, by a bold movement, he dislodged Antiochus from the pass of Thermopylæ, and had the chief glory of the victory gained there by M. Acilius Glabrio. In 184, the year in which Plautus died (it is useful to connect the life of Cato with the literature of his country), he was elected censor, and, as was before observed, with Valerius for his colleague. This censorship he made memorable in the annals of Roman history by the strictness with which he executed its important duties. He was now 50 years of age, and he continued for more than 30 years to take a prominent part in public life. But the unflinching determination with which he attacked the crimes and vices of the nobles called up many assailants upon himself. No Roman was ever a party to more public prosecutions, or had to defend himself against more. Even in his 81st year, he had to support himself against an accusation which had no foundation but the malice of his enemies. But these attacks produced no effect upon his courage. When Sergius Galba had disgraced his country by the massacre of the Lusitanians after they had surrendered upon terms, and was brought to public trial at Rome, Cato again subscribed his name as one of the prosecutors, and took an active part in the proceedings. This trial was followed almost immediately by his death, at the age of 85, in the year B.C. 149. Thus as he entered active life soon after the invasion of Italy by Hannibal, so he just lived to see the commencement of the third Punic war, a war indeed into which the Romans were induced to enter chiefly by the urgent advice of Cato himself.

So far we have seen in him the successful soldier and the vigorous statesman. As an orator, an agriculturist, an historian, he was scarcely less celebrated. When yet living on his Sabine farm, he had been in the daily habit of appearing in the petty courts of the neighbourhood as the able advocate of his friends; afterwards at Rome he was one of the most distinguished orators in the forum; and as many as 150 of his orations were preserved and admired for many ages. As a writer on agriculture, he is still known by his work entitled '*De Re Rustica*,' which, however, is certainly not in the form in which he wrote it. The language is not sufficiently antiquated for the age in which he lived; and besides this, there is abundant evidence that several parts of the work are lost, particularly the dedication to his son. The work, as we have it, consists of very brief directions for the management of a farm, and for economical housekeeping, from the buying of an estate to a charm for curing oxen and a receipt for cheesecakes. It is in this work that he lays down the principle, which excites the just indignation of Plutarch, the duty of selling off old oxen, old waggons, and old slaves. (§ 2.) Of his historical work but a few fragments remain. It was entitled '*Origines*,' and according to the life of Cato, which passes under the name of Cornelius Nepos, the first book treated of the Roman monarchy, the second and third of the origin of the chief cities of Italy, the fourth and fifth of the first and second Punic wars; the sixth and seventh continued the history down to the prætorship of Galba above mentioned. In the latter part of his history he enlarged upon his own achievements without any affectation of modesty. This history was written at the close of his life, so that Livy is guilty of an anachronism in making the tribune L. Valerius quote the '*Origines*' against the author at the time when Cato was consul. (Liv. xxxiv. 5.)

Cato was twice married. By his first wife he had a son, Marcus, who married a daughter of L. Æmilius Paulus, the sister of the second Scipio Africanus, and died while prætor during his father's lifetime. His second wife was Salonia, by whom he had a son, surnamed from his mother Saloninus. This son was the grandfather of Cato Uticensis. The character of Cato is boldly drawn by Livy in the 40th chapter of his 29th book. He was indeed, as Livy calls him, a man of iron body and iron soul, "*ferrei prope corporis animique*." The chronology of the life of Cato is tolerably certain, notwithstanding the errors of Livy, Plutarch, Valerius Maximus, and Cornelius Nepos. See Clinton's '*Fasti*.' His historical fragments are printed at the end of Curt's '*Sallust*,' they have been also published by Krause in his '*Fragmenta veterum Historicorum Romanorum*,' Berolini, 1833; and separately by Lion, under the title '*Catoniana*,' Gott., 1826. The fragments of his '*Orations*' are given by Meyer in his '*Oratorum Romanorum Fragmenta*,' Turici, 1842. The '*De Re Rustica*' is found in Gesner's and in Schneider's collection of Latin works on that subject.

CATO, MARCUS PORCIUS, who was surnamed UTICENSIS (of Utica) from the place of his death, was the great-grandson of Cato the Censor, and was born B.C. 93. He is said to have shown in early youth great powers of mind and firmness of character. When very young he was chosen to fill the office of priest of Apollo, and that he might the better discharge the duties of his office, he determined to secure the instructions of a preceptor in morality. The character of his mind naturally led him to embrace the philosophy of the Porch, and he became a pupil of Antipater the Stoic. Inflexible decision, severity

and harshness, appear to have been the prominent features of his mind; and the great privations and hardships to which he frequently subjected himself, such as abstaining from food and making long journeys bare-headed and in all weathers, were calculated to strengthen these peculiarities. His half-brother Cæpio was lost at sea, on which occasion he is said to have relaxed the sternness of his spirit, and he who rarely laughed was then seen to weep. The body was cast ashore by the waves, and was buried by Cato with great honours.

Coin of Cato.

British Museum. Actual size. Silver. Weight 60 grains.

Cato's military career commenced with his serving as a volunteer in the war of Spartacus, in which campaign he is said to have refused the distinctions with which Gallus, his commander, would have rewarded him. He afterwards went as a legionary tribune to Macedonia, and there presented a model of sobriety and courage. The designs of Metellus subsequently induced him to become a candidate for the office of tribune of the people. He was successful in his application, and gained by his conduct the general esteem of the public. Cato took part with Cicero against Catiline, and first gave him the title of '*Pater Patriæ*' ('Father of his Fatherland'): the speech which he made on this occasion respecting the punishment of the conspirators is preserved in Sallust. ('*Catil.*' c. 52.) He vehemently opposed the union of Pompey, Crassus, and Cæsar, and though threatened with banishment, fearlessly spoke against Cæsar's Agrarian Law. Through the influence of Clodius he was sent to seize Cyprus, in the hope that he would destroy his own influence by failing in the enterprise; and, that he might be kept the longer away from Rome, he was ordered to go to Byzantium to settle the affairs of that town. On his return he was elected prætor, in which office he endeavoured as far as possible to put a stop to bribery and corruption. At length, being unable to bring about a reconciliation between Cæsar and Pompey, he sided with the latter, and on the death of Pompey went over to Africa. Some dispute arising about the command of the troops in Africa, Cato resigned it to Q. Metellus Scipio, the father-in-law of Pompey; but he afterwards repented of this step, and wished that he had retained the command in compliance with the wishes of the army. Africa soon submitted to Cæsar, and the little that remained to oppose him was contained in the city of Utica. Cato encouraged his countrymen to stand a siege, but the approach of Cæsar alarmed them into submission. Upon this Cato advised his friends to save themselves by flight, and he even accompanied them to the port. Those who remained in Utica chose Lucius Cæsar to intercede for them with the conqueror, and Cato, though he would not allow his own name to be included in the petition, is said to have composed the speech which L. Cæsar was to make. After an evening's meal, and a spirited conversation with some other philosophers, he withdrew to his chamber, and after embracing his son and friends with unusual affection, he lay down and read a portion of Plato's '*Phædon*' on the immortality of the soul. His son and friends in vain entreated him to desist from his resolution to commit suicide. He stabbed himself below the breast, and died the same night. The inhabitants of Utica exhibited the utmost sorrow at the death of one whom they regarded as their benefactor and deliverer, nor did the approach of Cæsar prevent them from solemnising his funeral with the greatest pomp. When Cæsar heard of Cato's death he is said to have exclaimed, "Cato, I envy thee thy death, since thou hast envied me the glory of saving thy life!" He died, according to some, in the forty-eighth, and according to others, in the fifty-ninth year of his age.

(Plutarch, *Life of Cato*; Cicero, *De Offic.*, i. 31; Sallust, *Catil.*, cc. 52-54; Valer. Maxim., ii. 10, 7; Aul. Gell., iv. 10; Horat., *Od.* i. 12, 35, il. 1, 24; Lucan, i. 128; Virg., *Æn.*, vi. 841, viii. 670; Juven., xi. 90.)

CATO DIONYSIUS. [DIONYSIUS.]

CATS, JACOB, a very eminent Dutch poet, whose writings were for a long period far more popular than those of any of their authors among his countrymen, was born at Brouwershaven, in Zealand, November 10th, 1577. His mother dying while he was very young, and his father marrying again, he was taken in charge by a maternal uncle, who spared no cost on his education; but his progress in his earlier studies was far from great. At Leyden he went through a course of jurisprudence, and made some proficiency in Greek. On quitting Leyden, he proceeded to Orléans, where he took the degree of Doctor of Laws; and he remained some time in France, both in order to perfect himself in the language and to enjoy the lively society into which he was introduced there. On his return home, he first practised as advocate at Brouwershaven, where he soon obtained considerable reputation in his profession. Being attacked however by an obstinate tertian fever, he was advised to try the effects of travelling and change of air, on which he visited England, but reaped no other advantage

from his journey than an acquaintance with the language, and what he derived from the studies he pursued at both Oxford and Cambridge. At length, after having in vain sought relief from all the medical men whom he consulted, he recovered his health by means of a powder given him by an old alchemist. He now removed to Middleburg, where he married a lady named Valkenburg, by whom he had five children. It was during this part of his life—the one which he afterwards, amid the toils and dignities of office, acknowledged to have been by far the most enviable portion of it—that he produced his 'Embleme' and 'Spiegel van den Ouden en Nieuwen Tijd.' But the war which broke out in 1621 compelled him to quit Middleburg and go to reside at the Hague. After being made pensionary of Dordrecht, in 1622, he was despatched on an embassy to England in 1627, when he was knighted by Charles I. About nine years later he was elevated to the dignity of pensionary of Holland, which he retained till 1651, and in the following year again came over to England on an embassy to Cromwell, although he would fain have excused himself from the honour, and was ultimately obliged to return without having effected any of the objects of his mission. This was the close of his public life; and he was now permitted to enjoy, in his rural retreat at Zorgvliet, near the Hague, that tranquillity and leisure after which he had long sighed. It was here that, at an age exceeding threescore and ten by several years, he resumed his literary and poetical pursuits, and composed his 'Buitenleven' ('Country Life'), and numerous other productions, constituting the principal bulk of his works. Thus usefully, as well as innocently employed, he continued to enjoy life, while he looked forward to death without apprehension, till he expired calmly, September 12th, 1660, shortly before he completed his eighty-third year.

Cat's popularity with his countrymen was for a long period greater than that of any other of their poets; and by them he is even now familiarly yet affectionately styled *Vader Cats*. His popularity was derived from other merits than usually accompany more brilliant genius. His works may be regarded as a fund of moral instruction for all ranks and ages, and as a vast store-house of didactic precepts and examples applicable to almost all the varying circumstances of life. His muse never takes any elevated flights; on the contrary, his poetical style, always plain and familiar, occasionally borders on the homely and colloquial; but most of his poems being in the form of dialogue, such a style is not only excusable but appropriate, nor does it ever sink into the mean and vulgar. It is for the most part marked by a naïveté of thought and expression, and by a simplicity, which are becoming and agreeable enough. He frequently exhibits however striking originality and felicity of ideas. Like his diction, his versification is easy though rather monotonous, and appears to have flowed from his pen without effort; and he certainly did much towards refining and improving his native tongue, imparting to it greater freedom and pliancy. But with him manner was only secondary and subsidiary to matter; his aim was not so much to shine as to instruct; and it is in the character of a moral teacher that he is chiefly to be viewed. His lessons are those of practical wisdom and virtue, applicable to the daily concerns of life. He addressed himself to the many, and there can be no doubt that his works have been largely influential for good, and all the better calculated to attain their end by combining entertainment with moral instruction. At the same time he is not exempt from the charge of prolixity and excess. At the present day both his language and manner have become somewhat antiquated; and accordingly he is now more praised than read.

*CATTERMOLÉ, GEORGE, born in 1800, at Dickleburgh in Norfolk, is one of the most powerful and original of the English school of painters in water-colours. His earliest drawings were made, we believe, for some of Mr. Britton's architectural publications, and the technical skill he thus obtained has been turned to good account in his more important later works. His pictures, though mostly semi-historical or poetical, embrace a wide range of subjects: many of them are illustrative of the more striking scenes of Scott's novels; many are taken from Shakspeare's plays; others represent subsidiary circumstances connected with English history, like his 'Sir Walter Raleigh witnessing the Execution of the Earl of Essex in the Tower;' others again, like his great picture of 'Luther at the Diet of Spiers,' illustrate more important historical events; some, like 'The Horn of Egremont Castle,' are from texts furnished by the poets; and a large number are wholly imaginative. Especially is he fond of painting knights in armour, or old cavalier and commonwealth soldiers in buff and breastplates, or monks in their refectories or reading in some gloomy old chamber, or (like his 'Salvator Rosa') brigands in their wild haunts; but whatever he paints is marked by striking originality of conception and vigorous execution. He paints in a manner quite his own—in body-colours on a coarse rough paper—in a bold, free, seemingly careless manner, and sometimes with considerable looseness of drawing; but his pictures always display so much imagination, often such genuine poetic feeling, are so fine in colour, chiaroscuro, and tone, and show such evident mastery over the materials, that they certainly retain the attention by their merits as they arrest it by their peculiarities. For a long series of years Mr. Cattermole's pictures were among the chief attractions of the exhibitions of the Society of Painters in Water-Colours; but after for three or four seasons contributing only a few small paintings, he in 1863 ceased to

be a member of the society, and his works have since been seldom seen in public exhibition-rooms. He now paints chiefly in oil. To the general public Mr. Cattermole is perhaps best known by the series of designs engraved for the 'History of the Civil Wars,' by his brother the Rev. R. Cattermole.

CATULLUS, CAIUS VALERIUS, sometimes, but erroneously, called QUINTUS VALERIUS CATULLUS, was born at Verona, *ucc.* 87, about seventeen years before Virgil and twenty-two before Horace. His father Valerius was of a respectable municipal family in that city, and lived in habits of intimacy with C. Julius Cæsar, who appears, when his affairs led him to visit or pass through Cisalpine Gaul, to have taken up his abode at the house of Valerius. Catullus left his paternal roof at an early age for Rome, where he plunged into dissipation and extravagance, mortgaged his estate, and fell into great poverty. His pecuniary misfortunes do not seem to have broken his spirit or abated his good humour. He laughs off his mortgage with a pun, and jokes on his poverty with the utmost indifference. However, to improve his fortune, he, together with his brother, accompanied the prætor Memmius (the same to whom Lucretius dedicated his immortal poem) to Bithynia. This expedition, as respects the object our poet had in view, was completely unsuccessful. He returned as poor as he went, and on his voyage home had the additional misfortune to lose his brother, to whom he was affectionately attached, and who died on the coast of Troy. The death of his brother he deploras on more than one occasion in his works with great pathos, and in a style of natural and genuine feeling. The voyage from Bithynia home was performed by sea in a small open pinnace, called a *phaselus*, an undertaking which strongly shows the poet's courage and perseverance. A voyage of that length, from its commencement in the Buxine to its termination on the shores of the Lake Benacus, in so fragile a bark, satisfactorily proves that Catullus was not deficient in at least one Roman virtue—a contempt of danger. He concluded this arduous enterprise by ascending the Po, and finally by the Minus reached the promontory of Sirmio on Lake Benacus. On this promontory, where he appears to have possessed some property, he dedicated his little bark to Castor and Pollux in some verses which have been much admired. From the time of his return from Bithynia he continued to reside mostly at Rome, pursuing his pleasures, though living, as we collect from his writings, in poverty. From the same sources we derive the information that he possessed estates both in the Sabine country and at Sirmio, probably of little value.

His chief or only patron was Manlius Torquatus, on whose marriage with Julia he wrote his 'Carmen Nuptiale.' Notwithstanding his poverty, he lived in intimacy with all the men of talent of his day, among whom were Cicero, Cornelius Nepos, Licinius Calvus the orator, Asinius Pollio, Varus, Cornificius, Cælius of Verona, Hortatius, Cæcilius, and others. Cicero is supposed by some to have pleaded a cause for him; good critics however deny or doubt the fact. Judging from his writings and the freedom with which he indulges in satire, without regard to the rank, power, or wealth of the object of it, we may fairly pronounce that Catullus possessed a lofty independent spirit. His boldest flight was against Julius Cæsar, even in the plenitude of his power. He lashed his extravagance and his partiality for Mamurra with unsparing severity. For this however he afterwards apologised; and the generous conqueror invited the poet to his table on the same day, and still continued his intercourse with his father Valerius.

Of all the poet's favourites, Clodia, who appears under the feigned name of Lesbia, seems to have enjoyed the greatest share of his affection and of the effusions of his muse. His lines on the death of Lesbia's sparrow are perhaps as well known and as often quoted or alluded to as any verses he ever wrote. In his day Catullus bore the character of a learned person, and the epithet 'doctus' is frequently applied to his name in the various testimonials which have reached us of his fame and merits. This he perhaps obtained from his knowledge of the Greek language, and from the translations he made of some of the odes of Sappho and the poems of Callimachus.

A considerable part of the writings of Catullus is supposed to be lost. He died, according to some, at the age of forty or thereabouts; according to others he attained the advanced age of seventy-one. The latter opinion is combated at great length, and very successfully, by Bayle in his 'Historical and Critical Dictionary.' The concurrent testimony of all the men of wit and learning of his own and after times establishes his character as a man of first-rate talents and a true poet. He possessed a brilliant imagination, and clothed his thoughts in the best language. His style is easy and unaffected; he is always free from conceit or bombast; his lines are full of sweetness and harmony. In his playful moods he has many touches of humour, and is always entertaining and agreeable. When pathetic, his feelings are natural and unrestrained. Many of his thoughts have been borrowed by subsequent writers. He fell into the vice of his age, and several of his pieces are degraded by the most obscene ideas couched in the most revolting expressions. The only palliation for this offence that can be offered is the manners of the times, when the grossest violations of propriety were overlooked, if not encouraged, by those whose power, wealth, and influence enabled them to set the fashion.

His longest and most beautiful poem is the 'Epithalamium of Peleus and Thetis.' It has been objected to this piece that the author, immediately after its commencement, digresses into an episode longer

than all the rest of the poem, being a narrative of the desertion of Ariadne by Theseus on the shores of Naxos, and having no reference to or connection with the main story, into which it is introduced as a description of the embroidery on the garment of Thetis. To this criticism, which applies to the plan and not to the execution of the poem, it may be observed that what editors and commentators have thought fit to call the 'Epithalamium of Peleus and Thetis,' is possibly only part of a longer and unfinished work, intended by the author to bear a different designation, or it is only the fragment of the entire work which has come down to us. However that may be, the sufferings of Ariadne, and her desertion of her father's house, form a fine contrast with the chaste loves and the happy marriage of the parents of Achilles, and her story may have been selected by the poet with a view to produce that effect.

The poems of Catullus are said to have been unknown to the moderns till the beginning of the 15th century, and that it was only about 1425 that a copy, found in a granary, was first sent to the native city of the author. The following are the most esteemed editions of Catullus:—Vossius, Lond. 1684, and Utr. 1691; Vulpius, Patav. 1737; the 'Variorum' of Grævius, with Tibullus and Propertius, Utr. 1680; Mattaire's in 1715; in the 'Corpus Poetarum,' Lond. 1713; and Doering, Leipzig, 1788 and 1792, and Altona, 1834; and Lachman, Berlin, 1829. The poems of Catullus have been translated into English by Dr. Nott, 2 vols. 8vo, 1795, and by the Hon. George Lamb, 2 vols. 12mo, 1821.

(Catullus, Suetonius, Vulpius, Bayle, and the different commentators and editors of Catullus.)

* CAUCHY, AUGUSTIN LOUIS, mathematician, was born at Paris, 21st of August, 1789. His father, Louis François, was a poet, and became archivist of the Chamber of Peers. The son was carefully and religiously educated. In 1804, while at the Écoles Centrales, he was crowned by the Institute as the pupil who had carried off most prizes, among which was the first in Latin poetry. In the following year he entered the École Polytechnique as second scholar, and in 1806, when only in his seventeenth year, his solution of a difficult problem was printed in the 'Correspondance' of the school.

From the École Polytechnique, where he rose to the first place, M. Cauchy entered that of the Ponts et Chaussées, maintaining the same position. He was afterwards appointed engineer of the works for the port of Cherbourg; and from this date commences his long series of mathematical researches in questions previously unsolved. Among the first was his demonstration of Euclid's celebrated theorem on the polyhedra. In 1813 he published his 'Méthode pour déterminer à priori le nombre des racines réelles négatives d'une extraction d'un degré quelconque,' which was followed by papers on the properties of integrals, taking up questions started by Clairaut. In 1815 he received the grand mathematical and physical prize of the Institute for his paper 'Sur la Théorie des Ondes,' which became the basis of a theory of light.

In 1816 Cauchy was elected a member of the Academy of Sciences, and was appointed professor of mechanics in the École Polytechnique, and in the same year he published his demonstration of Fermat's theorem of the polygonal numbers. His lectures had a most salutary influence on the educational results of the school, and the progress of his pupils was materially aided by the works which he successively published: 'Cours d'Analyse,' 1821; 'Leçons sur le Calcul différentiel,' 1826; 'Leçons sur les Applications du Calcul infinitésimal à la Géométrie,' 2 vols. 4to, 1826-28. At the same time he continued his valuable series of papers for the Academy, among which are 'Sur les Intégrales définies entre les Limites Imaginaires,' 1825; 'Sur l'Application du Calcul des Résidus à la solution des Problèmes de Physique Mathématique,' 1827; 'Sur la Résolution d'Équations numériques, et sur la Théorie de l'Élimination,' 1829; 'Sur la Théorie des Nombres,' and others. The last was presented in May 1830. The revolution which followed deprived M. Cauchy of his public employment, as his loyalty to the Bourbon dynasty prevented his taking the oath of allegiance to the government of Louis Philippe. Under these circumstances he accepted the offers of the King of Sardinia, who invited him to deliver a course of physico-mathematical lectures at the university of Turin. In 1832 the Royal Society of London elected Cauchy one of their fifty foreign members. In the following year he received an invitation from Charles X. to undertake the scientific education of the Duc de Bordeaux, who then resided at Prague; and he cheerfully devoted himself to the task. While thus engaged he resumed in 1835 the publication of his 'Exercices de Mathématiques,' which had been for some years interrupted. In 1836 he published his 'Mémoire sur la Dispersion de la Lumière.' In 1838, having terminated his work of instruction, he returned to Paris, and took part in a scheme for training a superior class of professors in the interests of legitimacy. He was chosen a member of the Bureau des Longitudes in 1839, but the minister refused to sanction the choice, remembering the refusal to take the oath of allegiance.

Cauchy's diligence appears to have increased with his years. The number and nature of his communications to the Academy may best be judged of by reference to the 'Comptes Rendus,' at one time they became so multiplied that their publication overstrained the Academy's funds. Concurrently he wrote papers which appeared in other scientific periodicals, chiefly in Lionville's 'Journal de Mathématiques,'

among which his 'Note sur le développement des fonctions en séries ordonnées suivant les puissances ascendantes des Variables,' published in 1846, is especially remarkable.

In 1848 a professorship of mathematical astronomy having been created at the Faculty of Sciences of Paris, M. Cauchy was appointed to the chair; but, as had happened eighteen years before, his refusal to take the oath required in 1852, again lost him his public employments. He has since continued his studies; adding every month to the number of his works. He has treated of the higher branches of algebra, the theory of numbers, the infinitesimal calculus, mechanics, astronomy, and physics, exploring indeed every branch of mathematical analysis. Of him it has been said that he has "thrown back the limits of the integral calculus; and if showing a preference for abstract questions, he has on the other hand rendered important service to the elementary portions of science, by simplifying the theory of asymptotes, introducing the use of limits in all parts of geometry, and by giving an elegant demonstration of the fundamental theorem of the theory of equations."

M. Cauchy is a member of several scientific societies. Besides the works above mentioned, he published at Turin his 'Resumés Analytiques,' 4to. In 1836 appeared 'Sur la Théorie de la Lumière,' 8vo; 'Sur la Mécanique céleste,' &c., 8vo, in 1831—and a large number of others in the 'Mémoires' of the Academy, in the 'Annales de Mathématiques,' and other scientific journals. He has shown too, that he inherits his father's poetical ability and lively imagination, and relieves at times his severer studies by the composition of French and Latin poetry. In 1834 one of his poems 'Charles V. en Espagne' was published, which has much merit, and exhibits the monarchical predilections and religious opinions which have actuated the whole life of the author.

* CAVAIGNAC, GENERAL LOUIS EUGÈNE, son of Jean-Baptiste Cavaignac, member of the Convention and of the council of the Five Hundred, and brother of the late Godefroy Cavaignac, repeatedly prosecuted by Louis Philippe, was born at Paris on the 15th of December 1802. In 1820, at the age of eighteen, he entered the École Polytechnique. In the years 1828-29 he served in the second regiment of Engineers as captain, and took an active part in the campaigns of the Morea. Like most of the sons of the noted republicans of the Great Revolution, he adopted early in life the principles of his father; he was consequently one of the first to adhere to the revolution of July, in 1830. But the free expression of his opinions having given offence to his superiors, he was sent in 1832 to join the army in Africa. Even there he could not control or conceal his republican opinions; but the brilliant courage he displayed, and the services he rendered, drew upon him the notice and the esteem of his commanding officers. He was employed in the expeditions of Medeyah, Bouffard, and Chirchell; and in the several battles and skirmishes of Ouara, Col de Moozaia, &c., he gave proofs of that aptitude for war, which bespoke the future general. But it was especially in the expedition against Tlemcen that he proved his capacity, and evinced his valour.

After the capture of Tlemcen, in January 1836, Marshal Clausel formed a battalion of volunteers to garrison the citadel of that town; and gave the command of the place to Captain Cavaignac. In this isolated position, he maintained himself with great honour. Although frequently attacked by the Arabs, and blockaded by Abd-el-Kader, he held out, teaching his troops, both by his example and intrepidity, to endure the severest privations without a murmur. It was not however till May 1837 that he received further promotion. Shortly after the taking of Constantine, Cavaignac was transferred to the Zouaves; after which he had a battalion in the infantry of the line. In 1839 he published a work of considerable value, entitled 'De la Régence d'Alger.'

Although his health and constitution were at all times delicate, Cavaignac sustained with unflinching resignation the trials and fatigues of a camp life; being remarked as constantly the first to meet the enemy, and the last to retire to his tent. At the same time his qualifications for providing resources and administering them when found, were of a high order. Having returned to the corps of Zouaves, as lieutenant-colonel, on the 21st of June 1840, he was created colonel the following year; but a short time before the battle of Italy, he joined the 32nd of the line. It was in the capacity of commander of the van-guard, in this memorable action, that he so ably supported General Bugeaud against the army of Morocco. For his behaviour in this battle he was made *maréchal de camp* on the 16th of September 1844. After suppressing several revolts among the tribes on the western frontier in 1845, he invaded Morocco in February 1846, at the head of 6000 men, driving before him the redoubtable Emir Abd-el-Kader.

In 1847 he succeeded Lamoricière in the government of Oran, and on the 24th of February 1848, he received his appointment as governor-general of Algeria, by a decree from the Provisional Government. Two months after this, Lamartine, having foreseen the impending dangers by which France was threatened, invited Cavaignac to the capital. His great ability, and his decision in quelling the insurrection of June, established his character both as a citizen and as a soldier. It was by far the most serious revolt which had occurred since 1789. Cavaignac met the threatened danger with promptitude. A force of 75,000 regulars and nearly 200,000 National Guards was

collected in and near the metropolis. Several powerful barricades were approached, attacked, and carried in the regular order of battle, Cavagnar himself, accompanied by Lamartine, leading the attack of the one erected in the Faubourg du Temple. On the second day of the insurrection, Paris was declared in a state of siege, and General Cavaignac was appointed Dictator, all the civil and military powers being committed to his charge. After four days' hard fighting, the contest came to an end by the defeat of the anarchists. The loss on both sides was appalling: two generals were killed, four others mortally and five badly wounded. In all, some 8000 persons were killed and wounded, and 16,000 made prisoners. No sooner had he quelled this great revolt, than the general laid down his authority. The National Assembly appointed him President of the Council, after which he became one of the candidates for the new office of President of the Republic. In this contest he was supported by 1,448,302 votes. On the 2nd of December 1851 he was arrested, but released after a short detention; and he has since then continued to reside undisturbed in France, although he has not given his adhesion to the government of the emperor.

CAVALIERI, BUONAVENTURA, was born at Milan in 1598, and entered into the order of Jesuits at an early age. He was afterwards professor at Bologna, and died there December 2, 1647. He was a pupil of Galileo, according to the testimony of his friend Riccioli, who professes himself much indebted to his assistance in his studies. But it is said that he did not obtain the professorship at Bologna, in spite of the strong recommendation of Galileo, until his skill in astrology had been duly certified. He was a victim to the gout both in hand and foot, and was confined almost entirely to his bed for twelve years before his death. There is an eulogy of him by Friar (quoted by Lacroix, 'Biog. Univ.'). All his works were published at Bologna, being 'Specchio Utorio,' &c. 1632; 'Directorium Generale Uranometricum,' 1632; 'Geometria Indivisibilibus Continuum,' &c. 1635; 'Trigonometria Plana et Sphærica,' 1635; 'Rota Planetaria,' 1640; 'Exercitationes Geometricæ Sex,' 1647.

If we may judge from a contemporary biographer, Ghilini, 'Teatro d'Uomini Letterati,' Cavalieri (or Cavalierus, as his name is usually Latinised) must have enjoyed a remarkable reputation in his day. But he has descended to posterity solely through his method of indivisibles, one of the predecessors of the doctrine of fluxions, and which [BARROW, LEIBNITZ; DIFFERENTIAL CALCULUS IN ARTS AND SCIENCES DIV.] must be considered as one of the first attempts at an organised method of dealing with the difficulties of the solution of which Archimedes had given the first example. Cavalieri considers a line as composed of an infinite number of points, a surface of an infinite number of lines, and so on, as in the following sentence: "Hinc manifestum est figuras planas nobis ad instar telæ parallelis filis contextis concipiendæ esse; solida vero ad instar librorum, qui parallelis foliis concervantur. Cum vero in telâ sunt semper fila, et in libris semper folia numero finita, habet [habent] enim aliquam crassitudinem, nobis in figuris planis lineæ, in solidis vero plana numero indefinita . . . supponenda sunt." This method, absolutely considered, is defective and even erroneous, but the error is of the same kind as that of Leibnitz, who considered a curve as composed of an infinite number of infinitely small chords, and a surface of infinitely small rectangles. The error in both is one which does not affect the result, for this reason, that it consists in using the simplifying effect of a certain supposition too early in the process, by which the logic of the investigation may be injured, but the result is not affected. For instance, Cavalierus would consider a right-angled triangle as follows. Let n be the number of points in the base, then the perpendiculars at these points are in arithmetical progression, 0, a , $2a$, &c. . . na : the sum of all of which is $\frac{1}{2}n(n+1)a$, or $\frac{1}{2}n \cdot na$, throwing away $\frac{1}{2}na$ as an inconsiderable compared with $\frac{1}{2}n \cdot na$, when n is infinite. But $\frac{1}{2}n \cdot na$ is simply $\frac{1}{2}$ base \times perpendicular. Compare this method (absurd and almost unintelligible as it is, in the literal sense of the terms) with the following. Divide the base (b) into n equal parts, each of

which is therefore $\frac{b}{n}$. Let the perpendicular be p , consequently the

perpendiculars at the extremities of the parts are $\frac{p}{n}, \frac{2p}{n}, \dots$ up to $\frac{n \cdot p}{n}$,

and each multiplied by $\frac{b}{n}$, and the sum of the whole being taken, we have—

$$\frac{b}{n} \left(\frac{p}{n} + \dots + \frac{n \cdot p}{n} \right) = \frac{bp}{2} \frac{n^2 + n}{n^2} = \frac{bp}{2} \left(1 + \frac{1}{n} \right).$$

This is the sum of the inscribed rectangles, which approaches without limit to the area of the triangle as n is increased without limit. But it approaches to $\frac{1}{2}bp$ on the same supposition; whence $\frac{1}{2}bp$ is the area of the triangle. Either method, with caution, might be made to give true results, and in an intelligible manner; but that of Cavalierus is very subject to error, and we may say, requires a knowledge of better methods to understand it. But it is nevertheless the first attempt at generalisation, and serves to illustrate the position maintained by us [Barrow], that neither the fluxions of Newton nor the infinitesimals of Leibnitz were the actual methods by means of which the Differential Calculus (as now known) was made powerful. Cavalierus, with the 'method of development' of Newton, might have

established his title to the invention. But his algebra was very imperfect, even for his day: we cannot see proof, in 1617, that he had ever seen the writings of Vieta, who died in 1603. The celebrated Guldinus wrote against the method of indivisibles, and was answered by Cavalierus in the third of the 'Exercitationes Geometricæ.' Roberval claimed the method as his own, but his first publications on the subject followed those of Cavalierus.

CAVALLINI, PIETRO, a celebrated Roman painter of the 14th century, and one of the earliest masters of the modern Roman school, was born at Rome in the latter half of the 13th century, and lived at Rome during the interval that the popes resided at Avignon. Vasari's account of Cavallini is somewhat inconsistent with the period of his death as adopted by Manni and Lanzi, 1344; for if, as Vasari says, he was eighty-five when he died, he must have been a much older painter than Giotto, and can scarcely, as he states, have been his pupil. Vasari indeed says that Cavallini was living in 1361, but so many of his dates have been found to be incorrect, that he cannot be strictly depended upon. Cavallini was painter, architect, and worker in mosaic. He assisted Giotto in the mosaic or navicella of the porch of St. Peter's; and there are still some of his own mosaics in the Basilica of San Paolo and at Santa Maria in Trastevere at Rome. He executed also many paintings in the churches, but there are no remains of them; the last were destroyed by the fire which, in 1824, almost entirely consumed the old Basilica of San Paolo: the mosaics however, and a miracle-working wooden crucifix made by Cavallini, remained uninjured.

Cavallini painted also several frescoes at Florence, Orvieto, and at Assisi, some of which are still in a tolerable state of preservation. A crucifixion in the church of Assisi is the most remarkable and the best preserved. It contains a crowd of figures, some on horseback, and dressed in a variety of costumes; in the sky, which is a deep bright blue, are several angels. It is a work of great labour, and though the design is very angular, the figures sometimes distorted, and the perspective incorrect, the figures have expression and character, and if we consider the examples which can have been his only guides, we must pronounce it a highly creditable and meritorious work. Vertue believed that Cavallini designed the crosses which were erected to Queen Eleanor, and that he was the Petrus Romanus Civis of the inscription on the shrine of Edward the Confessor in Westminster Abbey, and accordingly the architect of the shrine which was finished in 1270. Walpole adopts the supposition, and concludes that Cavallini returned to England with the abbot Ware, who was elected in 1260, and went shortly afterwards to Rome to receive consecration from Urban IV. But this must be regarded as a mere conjecture.

The celebrated miracle-performing picture of the 'Annunciation,' or 'La Nunciata,' in the church de' Servi at Florence, formerly attributed to Cavallini, is now with more certainty attributed to a Maestro Bartolomeo who lived at Florence in 1236.

(Vasari, *Vite de' Pittori*, &c.; Lanzi, *Storia Pittorica*, &c.; Walpole, *Anecdotes of Painting*, &c.)

CAVALLO, TIBERIUS, a distinguished electrician, was born at Naples in 1749, and in the university of that city he completed his education. In 1771 he was sent to London, in order that he might obtain a correct knowledge of the mode in which mercantile transactions are conducted in England, but he soon abandoned the pursuits of commerce for those of natural philosophy, and in these he continued to be engaged till his death, which took place December 6, 1803. He was buried in old St. Pancras churchyard, London.

Cavallo was less distinguished for originality of thought than for his vast industry in the research of the laws of nature by the way of observation and experiment, and for his highly retentive memory; he possessed this faculty to such a degree that, at an age when he was unable to comprehend the reasoning employed, he knew by heart all the propositions and demonstrations in the books of Euclid. He had considerable skill in music, for which he retained the taste even after his sense of hearing was considerably impaired. He was appointed a member of the Academy of Sciences of Naples in 1779, and in the same year he was elected a fellow of the Royal Society of London.

The labours of Cavallo consisted chiefly in the performance of experiments relating to electricity and magnetism, by which he contributed much to the improvement of those branches of philosophy: he also made researches concerning the composition of the atmosphere and the characters of minerals. In order to determine the nature of the electricity in the atmosphere he employed what he called an 'atmospherical collector': this was a long rod having at one extremity a small glass tube terminating with a cork from which were suspended two pith balls. The rod being held out as far as possible from an upper window of the house, when the balls diverged by the electricity of the atmosphere, they were drawn in, and the nature of the electric fluid was ascertained by examination. In 1775, while residing near Irlington, he made a remarkable experiment with a kite, raised in the air to the height allowed by 120 yards of string, from which he ascertained that a great quantity of electricity may exist in the atmosphere without producing thunder or lightning. A small cloud passing over the house, he charged some jars with the electricity obtained from it, which he found to be positive; by degrees the quantity diminished till it became insensible, but after a short time

a great dark cloud rising towards the zenith, the fluid, which began again to be manifest, was found to be negative: the electricity continuing to increase and the rain falling copiously, he pulled in the kite lest some serious accident should happen; and in doing this, he received many strong shocks in his arms, breast, and legs. He frequently made experiments of this kind, with kites which were about four feet long and two feet wide; the string was of common twine twisted with threads of fine copper-wire.

He invented an instrument called a 'condenser of electricity,' which consisted of a tin plate between two parts of a wooden frame covered interiorly with gilt paper: the plate was isolated by being supported on glass pillars; and one edge being connected with the body containing the electricity, the effect of the condensation was shown, at the opposite edge, by the electrometer. He invented also a 'multiplier' of electricity, which consisted of two brass plates insulated by being supported on glass pillars, and of a third plate which could be insulated or uninsulated at pleasure: this last being fixed to a lever which turned on a pivot, after receiving electricity from one of the former plates, conveyed it to the other, with which an electrometer was connected: returning from the second plate to the first it received a fresh supply of electricity, which it conveyed in like manner to the other; and so on, till a sufficient quantity was accumulated on the latter.

Among his experiments was one in which were exhibited some remarkable phenomena of the electricity in glass tubes containing mercury. The mercury was boiled in the tube, and the latter being afterwards sealed, on elevating and depressing alternately the ends, electricity was excited by the friction of the mercury: this changed from positive to negative, and the contrary, as the tube was placed in direct and inverted positions.

Cavallo invented also a simple micrometer consisting of a thin and narrow slip of mother-of-pearl divided into parts each equal to 1-200th of an inch; this being fixed in the diaphragm of a telescope, at the focus of the eye-glass, served for measuring small angles.

Besides four Bakerian lectures on thermometrical and magnetical phenomena, and several papers on electricity and other subjects, in the 'Philosophical Transactions,' Cavallo published, in London:—1, 'A Complete Treatise on Electricity,' 8vo, 1777; 2, 'An Essay on the Theory and Practice of Medical Electricity,' 8vo, 1780; 3, 'A Treatise on the Nature and Properties of Air,' &c., 4to, 1781; 4, 'The History and Practice of Aerostation,' 8vo, 1785; 5, 'Mineralogical Tables,' 1785; 6, 'A Treatise on Magnetism in Theory and Practice,' 8vo, 1787; 7, 'Description and Use of the Mother-of-Pearl Micrometer,' 8vo, 1793; 8, 'Essay on the Medicinal Properties of Factitious Airs,' &c., 8vo, 1798; and 9, 'Elements of Natural and Experimental Philosophy,' 4 vols. 8vo, 1803.

CAVE, EDWARD, a printer to whom the literary world owes many obligations, was born at Newton in Warwickshire, February 29, 1691. He is principally known as the projector of the 'Gentleman's Magazine,' and as the friend and early patron of Dr. Samuel Johnson, who wrote an account of his life. He died January 10, 1754.

CAVE, WILLIAM, an eminent scholar and divine, was born December 30th, 1637, at Pickwell in Leicestershire, where his father was rector of the parish. He was admitted at St. John's College, Cambridge, in 1653, took the degree of B.A. in 1656, and that of M.A. in 1660. In 1662 he was admitted to the vicarage of Islington in Middlesex, and some time after became one of the king's chaplains in ordinary. He took the degree of D.D. in 1672, and in 1679 was collated by the Archbishop of Canterbury to the rectory of Allhallows the Great in Thames-street, London. In July 1681 he was incorporated D.D. at Oxford, and in November 1684 was installed canon of Windsor. He resigned his rectory of Allhallows in 1689, and his vicarage of Islington in 1691, having on the 19th of November 1690 been admitted to the vicarage of Isleworth in Middlesex. He died at Windsor on the 4th of August 1713, and was buried in Islington church, where a monument was erected to his memory. He published two single sermons, one preached before the lord mayor and citizens of London, November 5th, 1680, 4to, London, 1680; the other preached before the king, January 18th, 1684-85, 4to, London, 1685. His works of greater importance are:—1, 'Primitive Christianity,' in three parts, 8vo, London, 1672; reprinted several times since. 2, 'Tabulae Ecclesiasticae, Tables of the Ecclesiastical Writers,' fol., London, 1674; reprinted at Hamburg in 1676 without his knowledge. 3, 'Antiquitates Apostolicæ; or, the Lives, Acts, and Martyrdoms of the Apostles,' fol., London, 1676; republished in 1702. 4, 'Apostolici; or, the History of the Lives, Acts, Deaths, and Martyrdoms of those who were Contemporaries with or immediately succeeded the Apostles; as also of the most eminent of the Primitive Fathers for the first three hundred years: to which is added, a Chronology of the three first Ages of the Church,' fol., London, 1677. 5, 'Ecclesiastici; or, the History of the Lives, Acts, Deaths, and Writings of the most eminent Fathers of the Church that flourished in the fourth century,' fol., London, 1682. 6, 'A Dissertation concerning the Government of the Ancient Church,' 8vo, London, 1683. 7, 'A serious Exhortation, with some important Advices, relating to the late cases about Conformity, recommended to the Protestant Dissenters from the Church of England,' 4to, London, 1683. 8, 'Chartophylax Ecclesiasticus,' 8vo, London, 1685. 9, 'Scriptorum Ecclesiasticorum Historia Literaria a Christo nato usque

ad Sæculum xiv. facili methodo digesta,' in two parts, fol., the first printed at London in 1688; the second in 1693; republished, fol. Col. Allob., 1705 and 1720. The best edition is that printed at the Clarendon press, by subscription, in two vols. fol., 1740-43: it contains the author's last corrections and additions. Cave's 'Lives of the Apostles,' 'Lives of the Fathers,' and his 'Primitive Christianity,' are justly esteemed the best books upon those subjects.

CAVENDISH, HENRY, was the younger son of Lord Charles Cavendish, the brother of the great-grandfather of the present Duke of Devonshire, and was born at Nice, October 10, 1731. Having received his preliminary education in a private school at Hackney, he proceeded to Cambridge and matriculated December 13, 1749. He remained there till 1753, but did not graduate. He had during the life of his father a very moderate income, and his relatives were estranged from him by his determination not to enter upon public or political life; with the exception of an uncle, who, on his return from abroad in 1773, not being pleased with the conduct of the family towards Cavendish, made the latter heir to his fortune, which was very large. Cavendish devoted himself to mathematics and chemistry, to which his attention was probably turned by his father, who was himself a cultivator of the sciences; but his success, or at least its evidence, did not come very early, for he was more than 35 years of age before he published anything. He lived a retired life, and never married; his manners seem to have been eccentric, and to strangers very reserved. Indeed this reserve extended far beyond what would by ordinary people be considered as strangers. It is said by Dr. Children (Wilson's 'Life of Cavendish') that he was so shy towards females that he would never see even a female domestic, and "if an unfortunate maid showed herself, she was immediately dismissed." In order to avoid communication with his servants, it is added by Lord Brougham, "he used to order his dinner daily by a note, which he left at a certain hour on the hall table, whence the housekeeper was to take it." His library, Biot says, was immense, and he fixed it at a distance from his own residence, that he might not be disturbed by those who came to consult it. His friends were allowed to take books, and he himself never withdrew a book without giving a receipt for it. He died February 24, 1810, leaving more than a million sterling among different relations.

Of Cavendish as a philosopher, those who judge by the quantity of brilliant discoveries will not be able to form any opinion. His writings consist of a few papers in the 'Philosophical Transactions,' from 1766 to 1809. But in these papers we find methods and results which have occasioned his being sometimes called the Newton of Chemistry. Without such hyperbole, it may safely be said that he was the first, and one of the most useful, of those who laid the foundation of the science in its modern form. At the time when his first paper appeared, pneumatic chemistry had hardly an existence. It is true that different gases were known, that is, had been obtained as results of chemical processes; but they were not recognised as distinct substances. It was thought they consisted of common air mixed with foreign matter; and it was not imagined for instance, that the inflammable air produced by operating with one substance was the same as that from another. In 1766, Cavendish for the first time asserted and demonstrated that the fixed air (carbonic acid gas) was the same, whatever was the substance from which it was derived, and the same for the inflammable air (hydrogen), and that neither had the specific gravity of common air. He investigated for the first time the principal properties of the latter substance, and noticed the moisture which results from its combustion. In 1784, he completed the synthetical formation of water; that is, he found the moisture above mentioned to be simple water, and discovered that the remaining element of air, now therefore called nitrogen, was the constituent of nitric acid. He produced this substance by passing the electric spark through air over mercury, and saturating the result with a solution of potash, by which he obtained nitrate of potash, commonly called nitre. It has been keenly debated whether the discovery of the composition of water should be assigned to Cavendish or to Watt; but the result of the sifting which the question has undergone, appears to be that each arrived at the discovery by a different method and without being at all cognisant of the other's investigations. Cavendish's well-known experiment for the determination of the earth's density is described under ATTRACTION in the ARTS AND SCIENCES. DIV. Cavendish also wrote on the civil year of the Hindus, and on the division of astronomical instruments, and various papers on electricity.

We resist the temptation to swell this article to an extent proportionate to what the reputation of Cavendish deserves. The fundamentality, if we may use such a word, of his chemical results has not been surpassed by those of any other discoverer in chemistry. But he deserves fame for the great accuracy of his experiments, and the (then) unequalled soundness of his views. One writer asserts that every sentence he has written will bear microscopic examination. A French writer admits (we should say affirms) that he furnished Lavoisier with the materials of his system; and Sir Humphry Davy in a lecture delivered shortly after the death of Cavendish, speaks as follows: "His processes were all of a finished nature, perfected by the hand of a master; they required no correction; and though many of them were performed in the very infancy of chemical science, yet their accuracy and their beauty have remained unimpaired amidst the

progress of discovery." The discoveries of Cavendish were finished; he formed his substances both by analysis and synthesis; ascertained that the weight of his product was the sum of that of its components, and determined its specific gravity. He was the first who carried the mind and methods of a mathematician into the field from which the alchemist had not long retired, and in which the speculator still remained. And when we say the mind and methods of a mathematician, we do not deny that the inductive philosopher had already been there; but it was to remark phenomena, and not to measure quantities.

(John Wilson, M.D., *Life of the Hon. Henry Cavendish, including Abstracts of his more important scientific papers*; printed for the Cavendish Society, Lond., 1851; Rich. Art. *Cavendish in Biographical Universale*, &c.)

CAVENDISH, MARGARET, DUCHESS OF NEWCASTLE. This eccentric lady, the youngest daughter of Sir Charles Lucas, was born in Essex towards the close of the reign of James I. In 1643 she was appointed a maid of honour to Henrietta Maria; and, accompanying the queen to Paris, she became in 1645 the second wife of William Cavendish, who had formerly been Earl and was then Marquis of Newcastle, and who had borne arms in the civil war with courage and self-devotion. The exile of the Marchioness and her husband was chiefly spent at Antwerp, and was accompanied by frequent pecuniary embarrassments, which she had the spirit to avow in her memoir of her husband's life. Both of them were forced at one time to pawn even their clothes. A visit which she paid to England was unsuccessful in procuring any grant out of the family estates; but assistance furnished by relations enabled the Marquis and his wife to subsist more comfortably till the Restoration. On that event they returned to England; and in 1664 the Marquis was created Duke of Newcastle. The remainder of their married life was spent in the retirement of the country. The Duchess died in the end of the year 1678, and her husband, aged eighty-four, in 1676.

The period which succeeded the acquisition of the dukedom was chiefly devoted by the noble pair to that course of literary study and composition, which, however creditable in the motive, was rendered so whimsical by the eccentric character of the parties. Horace Walpole, in his 'Royal and Noble Authors,' found a tempting theme for his ill-natured wit in the picture of the duke and duchess, prosecuting their harmless occupations with an aristocratic forgetfulness of the whole world besides, each regarding the other as the greatest genius of the times, and each lavishing on the other, in conversation and in print, the most extravagant hyperboles of commendation. The Duke had long before appeared more than once as an author; and particularly by the publication of his work on 'Horsemanship,' first printed in French at Antwerp in 1658, and afterwards in English, with alterations, at London in 1667. In the later period of his life, the example of his wife tempted him to perpetrate some comedies which were even worse than her own. She was indeed at once the more ambitious and by far the more industrious writer of the two. There was scarcely any department of composition, either in prose or in verse, on which she did not exercise her ready pen. Her singularly constituted mind was always in fermentation; and, not content with recording its products at ordinary hours, she kept some of her attendant ladies within call even during the night, to write down the bright thoughts that arose in hours of sleeplessness. The result of this distempered activity was a collection of ten printed folios, besides other works that never saw the light. Catalogues of these, and of the Duke's works, will be found in Walpole and in the 'Biographia Britannica.' The best known works of the Duchess are her two volumes of plays, published respectively in 1662 and 1668. These effusions deserve a passing inspection from the student of literary history, both as monuments of unreddeemed and self-satisfied absurdity, and as examples of some principles in literary composition to which no author before or since has ever been bold enough to avow obedience. Not only for the higher laws of style, but even for the ordinary rules of English grammar, "the thrice noble, illustrious, and excellent Princess" (as her title-pages call her) professed a sovereign contempt. In several of those nine addresses "to the Readers" which, besides other profusions, stand in succession before her first volume of plays, she magnanimously declares her willingness that her writings should be unread by "such pedantic scholastic persons" as attach importance to grammatical distinctions of gender, and to those other laws of language, as to which she announces, that, if she understood them, as she does not, she would not follow them. Her practice was quite conformable to this frank profession. It is rarely, for example, that she condescends to join a plural verb with a plural nominative. But all such technical faults are as nothing, compared with the childish and senseless extravagances which in those plays make up the whole tissue of the matter. There is not in one of them a scene that is dramatic in anything but the form. That they should be free from coarseness was not to be expected in such an age; but some of the most indecorous scenes are carefully marked as having been written by "the Lord Marquess." The philosophical discussions which abound throughout are claimed by the lady as her own.

CAVENDISH, or CANDISH, THOMAS, was the son of a gentleman of fortune in Suffolk. It appears from Harris that he was of age and inherited his father's property in 1585, immediately after which he equipped a "stout bark of 120 tons" on his own account, and

accompanied Sir Richard Grenville in his voyage to Virginia and the West India. His outlay on this voyage was a serious inroad into his fortune: he derived no profit from it. According to some of his biographers, Cavendish, on his return from Virginia, still further reduced his property by becoming a courtier, and embarking in the extravagances of the gallants of Queen Elizabeth's days; and they state that his first grand voyage was undertaken (as the second undoubtedly was) to recruit his finances. The practice was common enough in his time, and men of rank and family thought it no disgrace to retrieve their fortunes by plundering on the Spanish Main. Their system to us appears to be scarcely better than that of buccaneering; but the cruelties of the Spaniards almost justified even the buccaneers: and it is to be remembered that in the days of Elizabeth there was open war with Spain, and while that power sent armadas to invade England, it was quite fair that England should attack Spain in the richest and most exposed of her transatlantic colonies.

The expedition, which was mainly fitted out at the expense of Cavendish, who sold or mortgaged the remainder of his estates for the purpose, consisted only of three small vessels—one of 120 tons, one of 60 tons, and the third of 40 tons; and the united crews, men and officers, did not exceed 123. But the mind of every one of these adventurers was inflamed with ideas of wealth to be obtained in a predatory voyage against the Spaniards, and they had full confidence in the valour and generosity of their young commander. Cavendish embarked in the largest ship, and sailed from Plymouth on the 21st of July 1586. Crossing the Atlantic, he ran along all the continent of South America as far as the Straits of Magalhaens, into which he boldly sailed on the 6th of January 1587. It took him thirty-three days to clear the Straits, but part of that time was well employed in surveying the coasts, rocks, &c., which were hitherto little known. As soon as he reached the Pacific Ocean (24th of February) he turned northward, and soon came to the scene of action which he had selected as likely to furnish most booty. The men fought and plundered bravely, but not without suffering considerable loss. They burnt Paite, Acapulco, and other settlements on or near the coast; they took some Spanish ships, destroyed others, and ravaged the sea-board of Chili, Peru, and New Spain. But the crowning blow of the expedition, and that on which Cavendish counted for wealth and honour, was the capture of the annual galleon, the *St. Anna*, which was loaded with valuable merchandise, and contained 122,000 Spanish dollars in hard cash. This ship was 700 tons burden, and well manned; yet, after lying in ambush for her under Cape Lucas on the coast of California, the English, whose number, small at first, had been greatly reduced by battle and sickness, attacked her, and carried her by boarding. After this Cavendish, starting from California, crossed the Pacific to the Ladrone Islands; from the Ladrone he sailed through the Indian Archipelago and the Straits of Java to the Cape of Good Hope; from the Cape he made for England, and he reached Plymouth on the 9th of September 1588, having been absent two years, one month, and a few days.

The circumnavigation of the globe had not before been performed in so short a time. In addition to despatch, Cavendish had the merit of making some geographical corrections: he reduced to its proper length the distance from Java to the Cape of Good Hope, which the Portuguese had greatly exaggerated; and he did a good deal, as already stated, towards the hydrography of the Straits of Magalhaens. He was also the first to point out to the English the local advantages of St. Helena, which before had been resorted to only by the Portuguese. He touched at that island, which he described as a delicious place, then covered with trees. On his return from this voyage he wrote a curious letter to Lord Hunsdon, a chamberlain and favourite of Queen Elizabeth. After telling the courtier how he had gained victory over her majesty's enemies, he sums up:—"I burnt and sunk nineteen sail of ships, small and great; and all the villages and towns that ever I landed at I burned and spoiled." Elizabeth knighted the successful depredator, and from the portion of the spoils that fell to his share as capitalist and commander, Sir Thomas Cavendish was said, in the language of the time, to have been "rich enough to purchase a fair earldom."

But in three years Cavendish was a poor man again, and to better his fortunes he once more turned his eyes to the New World. An expedition was prepared, not as formerly by himself almost alone, but by a sort of joint-stock of money, bravery, and adventure—an association which diminished his authority, and proved fatal to discipline; for those who had contributed as much as he had pretended to an equality of command with him. Quarrels and dissensions arose; and in addition to this misfortune the "three tall ships and two barques," which are said to have been well equipped, had to encounter tempests not met with in the former voyage. Their only success was the capture of the town of Santos in Brazil, but their reverses were numerous. Cavendish was obliged, by the mutinous spirit of his men, to abandon his bold plans here. Worn out by disappointments and vexations of all kinds, the hardy navigator died at sea on his return towards England in 1593.

(Harris, *Collection of Voyages and Travels*.)

CAVENDISH, WILLIAM, DUKE OF NEWCASTLE. [CAVENDISH, MARGARET.]

CAXTON, WILLIAM, to whom England owes the introduction of

printing, was born, according to his own statement, in the Weald of Kent. Of the date of his birth nothing is known with certainty, though Oldys places it in 1412. Lewis and Oldys suppose that between his fifteenth and eighteenth years he was put apprentice to one Robert Large, a mercer or merchant of considerable eminence, who was afterwards successively sheriff and lord mayor of London, and who, upon his death in 1441, remembered Caxton in his will by a legacy of 20 marks. Caxton at this time had become a freeman of the Company of Mercers. His knowledge of business however induced him, either upon his own account or as agent of some merchant, to travel to the Low Countries for a short time. In 1464 we find him joined in a commission with one Robert Whitehill, to continue and confirm a treaty of trade and commerce between Edward IV. and Philip, duke of Burgundy, or, if they found it necessary, to make a new one. They are styled in it ambassadors and special deputies. This commission at least affords a proof that Caxton had acquired a reputation for knowledge of business. Seven years afterwards Caxton describes himself as leading a life of ease, when, "having no great charge or occupation," he set about finishing the translation of Raoul le Fevre's 'Recueil des Histoires de Troye,' which he had commenced two years before, in 1469. The original was the first book he printed, and this translation the third. Of Caxton's pursuits and travels abroad we know little more than that in his peregrinations he confined himself, for the most part, to the countries of Brabant, Flanders, Holland, and Zealand, and finally entered into the service, or at least the household, of Margaret, duchess of Burgundy, who encouraged him to finish his translation of Le Fevre's 'History of Troy,' assisted him with her criticisms upon his English, and amply rewarded him upon the completion of his labour. From the prologues and epilogues of this work we discover that he was now somewhat advanced in years, and that he had learnt to exercise the art of printing, but by what steps he had acquired this knowledge cannot be discovered; his types only show that he acquired it in the Low Countries. He does not appear to have seen any of the beautiful productions of the Roman, Venetian, and Parisian presses before he had caused his own font of letters to be cut.

The original of Raoul's 'History,' the 'Oration of John Russell on Charles Duke of Burgundy being created a Knight of the Garter,' and the 'Translation' of Raoul, were, as far as we know, Caxton's first three works: the last finished in 1471. A 'Stanza' by Wynkyn de Worde notices an edition of 'Bartholomaeus de Proprietatibus Rerum' as printed by Caxton at Cologne (about 1470), but the actual existence of this edition is unknown. Nor has more certain information yet been obtained of the exact period of Caxton's return to his native country. The usual supposition has been that he brought the art of printing into England in 1474, and that this date is indicated by the figures which are united in the centre of his device as a printer. In 1477 however he had undoubtedly quitted the Low Countries and taken up his residence in the vicinity of Westminster Abbey, where and in which year he printed his 'Dictes and Sayings of the Philosophers.' Stowe says he first exercised his business in an old chapel near the entrance of the Abbey; but a very curious placard, a copy of which, in Caxton's largest type, is now at Oxford in the late Mr. Douce's library, shows that he printed in the Almonry. It is as follows:—"If it plesse any man spirituel or temporel to byo any Pyes of two and thre comemoracions of Salisburi vss empyrnted after the forme of this present lettre whiche ben wel and truly correct, late hym come to Westmonester in to the Almonesrye at the reed pale and he shal have them good chepe. Supplico stet cedula." According to Bagford, Caxton's office was afterwards removed to King-street.

From the evidence of Wynkyn de Worde, in the colophon of his edition of 'Vitae Patrum,' 1495, it appears that these 'Lives of the Fathers' were "translated out of French into English by William Caxton of Westminster, lately dead," and that he finished the work "at the last day of his life." His death however seems fixed, by two or three entries in the parish accounts of St. Margaret, Westminster, to the year 1491 or 1492, in which we read, "*Item; atte buryng of William Caxton for iiij. torches vj. viij^d. Item; for the belle at same Bureyng, vj.*" Wynkyn de Worde no doubt referred to this time.

Caxton, Mr. Warton observes, by translating, or procuring to be translated, a great number of books from the French, greatly contributed to promote the state of literature in England. In regard to his types, Mr. Dibdin says, he appears to have made use of five distinct sets, or founts of letters, of which, in his account of Caxton's works, he has engraved plates in fac-simile. Edward Rowe Mores, in his 'Dissertation upon English Typographical Founders and Foundries,' says Caxton's letter was originally of the sort called *Secretary*, and of this he had two founts; afterwards he came nearer to the *English face*, and had three founts of *Great Primer*, a rude one which he used anno 1474, another something better, and a third cut about 1482; one of *Double Pica*, good, which first appears 1490; and one of *Long Primer*, at least nearly agreeing with the bodies which have since been called by those names. All of Caxton's works were printed in what are called black letter.

The following is probably as complete a list as can now be recovered of the productions of Caxton's press:—1. 'Le Recueil des Histoires de Troye, composee par raulle le feure, chapelain de Monseigneur le duc Philippe de Bourgoigne en l'an de grace mil cccclxiii.' fol. 2. 'Propositio clarissimi Oratoris Magistri Johannis Russell, decretorum

doctoris ac adhuc Ambassiatoris Edwardi Regis Anglie et Francie ad illust. Principem Karolum ducem Burgundie super susceptione ordinis garterij, &c.' 4to. 3. 'The Recuyell of the Hystories of Troye,' composed and drawn out of diverse bookes of latyn in to Frensshe by Raoul le feure in the yere 1464, and drawn out of frensshe in to Englishe by William Caxton at the commaundement of Margarete Duchess of Bourgoyne, &c., whyche sayd translacion and werke was begonne in Brugis in 1468 and ended in the holy cyte of Colen 19 Sept. 1471, fol. 4. 'The Game and Playe of the Chesse,' translated out of the French, fynysshid the last day of Marche, 1474, fol. 5. A second edition of the same, fol. (with wood-cuts). 6. 'A Boke of the hooles Lyf of Jason,' 1475, fol. 7. 'The Dictes and notable wyse Sayenges of the Philosophers,' transl. out of Frenshe by lord Antoine Wydeville Erle Ryuyeres, empr. at Westmestre, 1477, fol. 8. 'The Morale Prouerbes of Cristyne (of Pisa),' fol. 1478. 9. 'The Book named Cordyale; or Memorare Novissima,' which treateth of 'The four last Things,' begun 1478, finished 1480, fol. 10. 'The Chronicles of Englonde,' Westm., 1480, fol. 11. 'Descripcion of Britayne,' 1480, fol. 12. 'The Myrroure of the World or thymage of the same,' 1481, fol. 13. 'The Hystorye of Reynart the Foze,' 1481, fol. 14. 'The Boke of Tullius de senectute, with Tullius de Amicitia, and the Declamacyon, which laboureth to shew wherein Honour sholde reste,' 1481, fol. 15. 'Godefroy of Boloyns; or, the laste Siege and Conqueste of Jherusalem,' Westm., 1481, fol. 16. 'The Polycronicon,' 1482, fol. 17. 'The Pylgremage of the Sowle,' transl. from the French, Westm., 1483, fol. 18. 'Liber Festivalis, or Directions for keeping Feasts all the Yere,' Westm., 1483, fol. 19. 'Quatuor Sermones' (without date), fol. 20. 'Confessio Amantis,' that is to saye in Englishe, 'The Confessyon of the Louer,' maad and compyled by Johan Gower, squyer, Westm., 1483, fol. 21. 'The Golden Legende,' Westm., 1483, fol. 22. Another edition of 'The Legende,' sm. folio. 23. A third, fin. at Westmestre, 20th May, 1483, fol. 24. 'The Booke callid Cathon' (Magnus), trans. fr. the French, 1483, fol. 25. 'Parvus Chato' (without printer's name or date, but in Caxton's type), fol. 26. 'The Knyght of the Toure,' transl. from the French; Westm., 1484, fol. 27. 'The Subtyl Hystories and Fables of Esope,' transl. from the French, 1484, fol. 28. 'The Book of the Ordre of Chyvalry, or Knyghthode,' transl. from the French (assigned to 1484), fol. 29. 'The Book ryal; or the Book for a Kyng,' 1484, fol. 30. 'A Boke of the noble Hystories of Kynge Arthur and of certen of his Knyghtes,' which book was reduced in to Englysshe by syr Thomas Malory Knyght, 1485, fol. 31. 'The Lyf of Charles the Grete, Kyng of Fraunce and Emperour of Rome,' 1485, fol. 32. Another edition of the same, 1485, fol. 33. 'Thystorye of the noble ryght valyaunt and worthy Knyghte Parys and of the fayr Vyenne, the doulphyns daughter of Vyennoy's,' transl. from the French, 1485, fol. 34. 'The Book of Good Maners,' 1486, fol. 35. 'The Doctrinal of Sapience,' transl. from the French, 1489, fol. 36. 'The Book of Fayttes of Armes and of Chyvalrye,' a translation from the first part of Vegetius de Re Militari, 1489, fol. 37. 'The Arte and Crafte to knowe well to dye,' transl. from the French, 1490, fol. 38. 'The Boke of Eneydos, compyled by Vyrgyle,' translated from the French, 1490, fol. 39. 'The Talis of Cauntyrburye' (no date), fol. 40. Another edition (without date or place), fol. 41. 'Infancia Salvatoris,' 4to. 42. 'The Boko of Consolacion of Philosophie,' whiche that Boecius made for his comforte and consolacion (no date nor place), fol. 43. A collection of Chaucer's and Lydgate's minor Poems, 4to. 44. 'The Book of Fame, made by Gefferey Chaucer,' fol. 45. 'Troilus and Creseyde,' fol. 46. 'A Boke for Travellers,' fol. 47. 'The Lyf of St. Katherin of Senis,' fol. 48. 'Speculum Vite Christi; or the myrroure of the blessyd Lyf of Jhesu Criste,' fol. 49. 'Directorium Sacerdotum; sive Ordinale secundum Usum Sarum,' Westm., fol. 50. 'The Worke (or Court) of Sapience,' composed by John Lydgate, fol. 51. 'A Boke of divers Ghostly Maters,' Westm., fol. 52. 'The Curial made by Maystre Alain Charretier,' transl. from the French, fol. 53. 'The Lyf of our Lady, made by Dan John Lydgate, monke of Burye,' fol. 54. 'The Lyf of Saynt Wenefryde,' reduced into Englysshe, fol. 55. 'A Lytel Tretise, intytuled or named The Lucidarye,' 4to. 56. 'Reverendissimi viri dni. Gulielmi Lyndewodi, LLD. et epi Asaphensis constitutiones provinciales Ecclesie Anglicane,' 24mo. 57. 'The Hystorye of Kynge Blanchardyne and Queen Eglantyne his wyfe,' fol. 58. 'The Siege of the noble and invynible Cytee of Rhodes,' fol. 59. 'Statuta apud Westmonasterium edita, anno primo Regis Ricardi tercii,' fol. 60. 'Statutes' made in the 1st, 2nd, and 3rd Parliaments of Henry VII., folio. (The only fragment of this work known consists of two leaves.) 61. 'The Accidence,' (mentioned in one of the sale catalogues of the library of T. Martin of Palgrave.) 62. 'The Prouffitable Boke of manes soule, called The Chastysing of Goddes Chyldern,' fol. 63. 'Hore,' &c., 12mo, a fragment of eight pages now at Oxford, in the library bequeathed to the Bodleian by the late F. Douce, Esq.

To these we may now add a volume by Caxton, recently added to the fine collection in the British Museum, and hitherto undescribed by any bibliographer. It is a collection of prayers, commencing with those called 'The Fifteen O's,' from each prayer commencing with the exclamation "O." The colophon bears that they are "enprinted bi the comaundementes of the most hye & vertuous pryncesse Elizabeth by the grace of God Quene of England & of Fraunce, and also of the

right eye and most noble princess Margaret under unto our sovereign lord the King Henry VII. by their most humble subject and servant William Caxton." There is no date in the book, but it is stated in the Museum catalogue that the type resembles that of Caxton's 'Virgil' of 1490. This unique volume was purchased by the Museum in 1851 of Mr. Pickering the bookseller.

In the 'Archæologia,' vol. 31 for 1846, is a paper by J. Winter Jenm, Esq., the present Keeper of the Printed Books at the British Museum, on two volumes in the Museum collection, one called 'Meditaciones sur les Sept Pseaulmes Penitenciaux,' the other, a French version of the 'Cordiale sive de quatuor Novissimis,' which Mr. Jones shows to be in Caxton's types, and to have issued in all probability from the press of Caxton. Neither of these volumes appear to have been known to any previous bibliographer.

Dr. Dibdin has included, among the printed works of Caxton, 'Clyde his Booke of Metamorphose, translated and fynysghed by me William Caxton at Westmestre the xxiij. day of Apryll, the yere of our lord M. lliij. C. lliij. And the xx yere of the regne of Kyng Edward the fourth,' but it remains in manuscript only, as far as is known, in the Pepysian collection now deposited in Magdalen College, Cambridge, and consists of the last five books of the 'Metamorphoses' only.

The two largest assemblages of the productions from Caxton's press now known are those in the British Museum, and in Earl Spencer's library at Althorp. The titles given in the present article have been collated with the books in the former of these collections.

(*Lewis, Life of Caxton*, 8vo, London, 1737; Oldys's account of him in the *Biographia Britannica*; Warton, *Hist. Engl. Poetry*; the first volume of Dibdin's edit. of Ames's *Typogr. Antiquities*; Chalmers, *Biogr. Dict.*; Knight, *William Caxton: a Biography*.)

*CAYLEY, ARTHUR, mathematician, was born on the 16th of August 1821, at Richmond, Surrey. He became a student in Trinity College, Cambridge, where he took his B.A. degree, and was Senior Wrangler and First Smith's Prizeman, in 1842. In the same year he was elected a Fellow of the college. He afterwards studied for the law, and was called to the bar in 1849.

Mr. Cayley has devoted himself to researches in the higher branches of mathematics. His papers on various subjects of pure mathematics are printed in the 'Cambridge,' the 'Cambridge and Dublin,' and 'Quarterly' Mathematical Journals. He is one of the four editors of the latter. In 1852 Mr. Cayley communicated a paper to the Royal Society, 'Analytical Researches connected with Steiner's Extension of Malfatti's Problem,' which was published in the 'Philosophical Transactions,' and in the same year he was elected a Fellow of the society. The general notion of a hyperdeterminant was first established by his papers 'On the Theory of Linear Transformations' ('Camb. Math. Journ.,' vol. iv.; and 'Camb. and Dub. Math. Journ.,' vol. i.) This theory forms part of the subject 'Quantics,' defined by him as the entire subject of rational and integral functions, and of the equations and loci to which these give rise, and now being developed by him in a series of highly important papers in the 'Philosophical Transactions of the Royal Society.' Mr. Cayley is also the author of papers in the 'Cambridge Philosophical Transactions,' the 'Philosophical Magazine,' and in the two well-known foreign periodicals, Liouville's 'Journal de Mathématiques,' and 'Crelle's' 'Journal für die reine und angewandte Mathematik.' He is at present a member of the Council of the Royal Society.

CAYLUS, COUNT, was born at Paris in 1692. He entered the army in his youth, and made some campaigns in Catalonia and in Germany. After the peace of Rastadt, he turned his attention entirely to the fine arts, and went to Italy for the purpose of studying them. He afterwards went to Constantinople and Asia Minor, and visited the ruins of Ephesus and Colophon. On his return to France, he applied himself to engrave and illustrate the cameos and other stones of the king's cabinet, and to superintend the publication of the fine work, 'Planches gravées du Cabinet du Roi,' in 2 vols. folio, descriptive of that collection. He also published engravings of the medals of the Roman Emperors belonging to the same collection: 'Numismata auri Imperatorum Romanorum e Cimelio Regis Christianissimi.' In 1731 he was made a member of the Academy of Sculpture and Painting, upon which he wrote the lives of the most celebrated painters and sculptors who had belonged to that society. He caused the drawings of Santo Bartoli, of Rome, which are representations of ancient paintings and mosaics, and form a very valuable collection of ancient art, to be engraved and coloured. 'Recueil de peintures antiques imitées fidèlement pour les couleurs et pour le trait d'après les dessins coloriés faits par P. Santo Bartoli,' fol., Paris, 1757. The engravings are beautifully executed. The celebrated mosaic pavement of Palestrina is among them. In 1742 he was made a member of the Academy of Inscriptions, for which he wrote numerous memoirs on ancient monuments, on ancient paintings, on the Egyptian obelisks, on mummies, papyrus, &c. He collected numerous antiques, and published the result of his investigations in his great work, 'Recueil d'antiquités Egyptiennes, Etrusques, Grecques, Romaines, et Gauloises,' 7 vols. 4to. The last volume was published in 1767, after his death; it contains a biographical notice of the author, by Le Beau. Caylus wrote also 'Nouveaux Sujets de Peinture et Sculpture,' 12mo, 1755; 'Mémoire sur la Peinture à l'Encaustique,' 8vo, 1755, which is a

revival of the method of encaustic painting of the ancients. He found out the means of incorporating the colour with stone. Caylus wrote several novels, which have no very great merit. He died at Paris in 1765. He was a warm, and, as far as it was in his power, a liberal promoter of the arts; extremely disinterested himself, he sought out and assisted indigent talent. He left his rich collection of antiquities to the King's Museum. In 1805 a compilation of memoranda was published, under the title of 'Souvenirs du Comte de Caylus,' 2 vols. 12mo.

CEAN-BERMEDEZ, JUAN AUGUSTIN, one of the few writers on art which Spain has produced, was born at Gijon in the Asturias, in 1740, and was the son of poor parents. He was educated in the Jesuits' College at Oviedo, where it was his good fortune to find not only a companion but a friend and protector in Jovellanos, with whom he resided two years at Alcalá and Seville, and then went with him to Madrid, in 1778. During Jovellanos' retirement shortly afterwards from office, he returned with him to Seville, where his admiration of the monuments of that city led him to apply himself to a systematic course of study in architecture and drawing. Encouraged by Jovellanos, he proceeded to Madrid in order to place himself under Mengs, but as that artist shortly after returned to Rome, he had not much time to profit by his instruction. When Jovellanos was recalled to office he procured an appointment for his friend. Some years afterwards Bermudez obtained a small pension, which enabled him to devote himself entirely to his literary pursuits as the historian of Spanish art. His first publication was the 'Diccionario Historico de los mas illustres Profesores de las bellas Artes en España,' 6 vols. 8vo, 1800; and his others are: 'Descripcion Artistica de la Catedral de Sevilla,' 1804; 'Descripcion del Hospital del Sangre,' 1804; 'Carta sobre el Estilo, etc. de la Escuela Sevillana,' 1806, in which he traces the progress of the Seville school of painting from the middle of the 15th century; 'Dialogo sobre el Arte de Pintar,' 1819; and lastly the 'Noticias de los Arquitectos y Arquitectura en España,' 4 vols. 4to, 1829, &c., a work founded upon materials collected by Eugenio Llaguno, who shortly before his death gave them to Bermudez, insisting upon his making use of them. Bermudez accordingly afterwards not only arranged and shaped them for publication, but made extensive additions and enlargements, and carried on the history to the close of the 18th century. Valuable as this work is for the mass of information and copious documents which it contains, it is rather one for mere reference than perusal, it being not so much a critical history of Spanish architecture as an industriously compiled register of facts, names, and dates.

Besides the preceding there is one other publication of his to be mentioned—the 'Memorias para la Vida de Jovellanos,' Madrid, 1814, in which he has left an affectionate portrait of that excellent friend. Ceán-Bermudez died in 1834, and left several manuscript works, one of which, on the Roman antiquities of Spain, was afterwards edited at the expense of the Royal Spanish Academy of History.

CEBES, a Theban philosopher, and a disciple of Socrates. He was the writer of three dialogues, called 'Πίναξ' (table or tablet), 'Ἐξέλιξις,' and 'Ἐπὶ πύκνῳ.' (Suidas v. Κ. 679. Diog. Laërt. ii. 125.) He is represented by Plato as attending Socrates in his last moments, and is one of the interlocutors in the 'Phædon.' The first mentioned of his dialogues has been very frequently edited, and is often one of the first books placed before the Greek student. It is a description of an allegorical picture, supposed to be affixed to the walls of a temple of Saturn, and representing the life and trials of mankind. Scholars have doubted whether it is rightly attributed to the Theban Cebes, but the Greek authorities are conclusive of its genuineness (see Lucian, tom. i. p. 702, and tom. iii. p. 5, Hemsterhuis); and the Attic dialogue in which it is written is no proof that its author was not a Theban, for moral dialogues were always written in Attic, just as the Ionic dialect was appropriated to the opus, and the Doric to lyric poetry. We know nothing of Cebes beyond the mention of his name by Plato, who makes Socrates call him a diligent inquirer after truth, and by Xenophon, from whom we learn that his moral character was most unexceptionable. The first complete edition of the 'Πίναξ' is that by J. Gronovius, Amst. 1689; the best are, perhaps, that by Schweighäuser, Lips. 1798, which also contains the 'Manual' of Epictetus, or his last edition of 1806, and that by Coraes, Par. 1826, in his edition of Epictetus.

There was a Cebes of Cyzicus, a Stoic philosopher contemporary with the emperor Marcus Aurelius, to whom some critics, apparently without much reason, would attribute the 'Table.'

There is a dissertation on the genuineness of the 'Table,' by F. G. Klopfer, Zwickau, 1818, 4to.

CECIL, WILLIAM, BARON BURLEIGH, was born at Bourne in Lincolnshire, on the 13th of September, 1520. His father was master of the robes to Henry VIII. He was placed successively at the grammar schools of Grantham and Stamford, and at the age of fifteen he was removed to St. John's College, Cambridge, where he was distinguished for the regularity of his conduct and the intensity of his application. At the age of sixteen he delivered a lecture on the logic of the schools, and three years afterwards another on the Greek language. At twenty-one he entered at Gray's-inn, and applied himself to the study of the law, the history of his own country, and especially the genealogy of its principal families. In August 1541

he married a sister of Sir John Cheke, who died in the second year of their marriage, leaving one son, Thomas, afterwards earl of Exeter. In the same year, having successfully contended in an argument on the supremacy of the pope and the Catholic faith, with two priests, chaplains of O'Neil the Irish chief, he was at the king's desire brought into his presence. Conceiving a favourable opinion of Cecil's abilities, the king, in order to secure his services, conferred upon him the reversion of the office of *custos brevium* in the Common Pleas, an office of considerable emolument, and which fell into his possession about five years afterwards. Shortly after the accession of Edward VI., Cecil married Mildred, daughter of Sir Anthony Cook, the director of the king's studies, which connection, together with his acknowledged high talents and habits of application, and his known attachment to the principles of the Reformation, procured him the friendship of the lord protector, to whose notice he had already been recommended by the Cheke family. In 1547 the lord protector appointed him his master of requests, an office not only of distinction but of great trust. In the same year he accompanied the lord protector in the Scotch expedition, and was present at the battle of Musselburgh. Cecil quickly acquired the esteem and confidence of the young king, and in the year 1548 was appointed secretary of state. On the fall of the lord protector, Cecil was committed to the Tower, but was discharged after an imprisonment of three months; and in October 1551, was by the Duke of Northumberland restored to his office, knighted, and sworn of the privy council. It does not appear that he was in any way privy to the fall of his early patron the lord protector; but the extreme caution of his subsequent behaviour to his fallen friend borders closely on ingratitude.

Soon after his re-appointment as secretary of state, Cecil effected several important measures. The abolition of the exclusive privileges of the merchants of the Steel-yard seems to have sprung from that large and enlightened policy which distinguished his whole career. He further proposed to abolish the staple or regular market for the wool and chief productions of England, then existing at Antwerp, and to open two free ports in England, one at Southampton, the other at Hull; but from the then low state of commercial knowledge, and the perplexities arising from state-intrigues, the plan was not accomplished.

Cecil took no part in Northumberland's designs for altering the succession to the throne on the death of Edward VI., though he affixed his name to the instrument of settlement as witness to the king's signature, at his earnest request. On Northumberland's march into Cambridgeshire Cecil joined Mary, who had already been declared queen, and by whom he was graciously received. Under the new reign he gave up his employments because he would not change his religion, but he continued in his usual cautious policy, and carefully abstained from joining in any of the proceedings of the opponents of the court. He even cultivated the friendship of many of Mary's ministers, and became attached to the party of Cardinal Pole, who, in opposition to Gardiner, advised moderation and mildness in matters of religion.

Being chosen in 1555 one of the members for his native county, he distinguished himself by his opposition to the measures of the Catholic party. The rejection of the bill for confiscating the estates of such as had quitted the kingdom on the score of religion is mainly attributed to him. In consequence of his conduct on this occasion he was summoned before the privy council, but he made so satisfactory a defence that he escaped committal to the Tower: a fate which befel those who were summoned with him. He however continued in that and the next parliament to advocate the cause of the persecuted Protestants. Foreseeing that Mary could not long survive, Cecil opened a private correspondence with the Princess Elizabeth, and enabled her by his communications and counsel to avoid the snares of the vindictive and suspicious Mary. On the very day of Elizabeth's accession he presented to her a paper setting forth twelve affairs which required immediate despatch; which particulars, it is remarkable, formed the basis of his chief measures throughout his long administration: they were doubtless the result of the broad and comprehensive survey his comparative retirement from active life had enabled him to take of the state of the kingdom. He was the first person sworn of the privy council in the new reign, and was forthwith appointed secretary of state. From this time until the close of his life Cecil directed the affairs of England. A full account of his life would be the history of the reign of Elizabeth. Capricious as the queen often was, her sound judgment enabled her to see the true value of Cecil, and induced her on many occasions to yield to his cool and dispassionate reasonings. In 1571 Cecil was created Baron Burleigh, in 1572 he received the Order of the Garter, and in the same year succeeded the Marquis of Winchester as lord high treasurer; in which office he continued till his death. These honours may seem but an inadequate reward for Cecil's services, but the peerage in the reign of Elizabeth was a mark of the highest favour, and a token of real merit. Except in the instance of Leicester, no example perhaps occurs in that reign of a title acquired without desert. It is impossible within the limits of this article to notice even the principal measures promoted by this great minister. In every branch of his policy, whether in relation to religion, which then formed so material a part of European affairs, the internal government of England, or her foreign policy,

he was guided by fixed and well-grounded principles; and no act of his administration appears to have been produced by motives of temporary expediency only, but to have formed a part of a consistent and well-considered plan. He was cautious and intriguing, but caution and intrigue were necessary in an age when negotiation was a system of duplicity. Few ministers have been exposed to more acrimonious attacks than Lord Burleigh. The favourites of the queen were at all times opposed to his judicious and economical policy. The frequent plots occasioned by the rancorous excitement of religious feeling—the disputes fostered by the unsettled state of the succession—the chivalrous feeling excited and produced by Mary queen of Scotland and her partisans—and the capricious conduct of Elizabeth, herself secretly approving even when publicly blaming her minister, and holding him up to screen herself from public disapprobation—all conducted to embarrass his plans and confound his operations. But the accurate information which Lord Burleigh at all times obtained, his vigilance, his unceasing application, and unimpeachable integrity, enabled him to overcome the difficulties which surrounded him, and to the end of his career to retain the favour of the queen and the respect and affection of her subjects. It is worthy of observation, that those parts of his conduct which have been characterised as unfeeling and selfish, have generally received the approbation of posterity; and it is admitted, with all the advantage we possess from the knowledge of the effects of his measures, that they were the most judicious that could have been taken for the preservation of the peace and welfare of his country, and the establishment of the reformed religion. He was distinguished for self-command and moderation. It was observed that he never spoke harshly of his enemies, nor embraced any opportunity of revenge; and as he was no less on his guard to avoid every undue bias from affection, it became a general remark that he was a better enemy than friend. "I entertain," he said, "malice against no individual whatever; and I thank God that I never retired to rest out of charity with any man."

In common with most other great public men, he possessed discernment in discovering men of peculiar talents for business. "He seemed resolved that England should be distinguished above all nations for the integrity of her judges, the piety of her divines, and the sagacity of her ambassadors." He encouraged open discussion, as tending to the discovery of truth. He was strictly and scrupulously impartial; magnificent in his several establishments; and liberal to his officers and dependents. He gave largely in charity, and increased his private fortune without borrowing from the coffers of the state, as before his time was the common custom with those who had the power, and without tarnishing his fame by any public or private extortion, as appeared at his death, when the queen instituted a rigorous inquiry into his affairs. In private he was cheerful, affable, and facetious; abstemious in his own diet, he enjoyed the cheerful relaxation at his table with his family and friends. Books and the superintendence of his garden at Theobald's formed the chief amusement in his few hours of leisure. His mind was strongly tinctured with piety.

In 1589 he lost his wife Mildred, his affectionate companion for forty-three years. The despondency produced by this calamity, the increasing infirmities of age, and successive attacks of the gout, rendered more severe by a weakness which had been caused by his sedentary habits, interrupted the unruffled calmness of his temper; he became subject to bursts of peevishness, but on such occasions he immediately endeavoured to make reparation for the pain which he had caused. He died on the 4th of August 1598, in the seventy-eighth year of his age, having held the station of prime minister of England for upwards of half a century. He had, by his second wife, Robert, created earl of Salisbury; Anne, married to Edward Vere, seventeenth earl of Oxford; and Elizabeth, married to William, eldest son of Lord Wentworth, of whom the first-named only survived him.

(Macdiarmid, *British Statesmen*; *Biog. Brit.*; Camden, *Annals*; Fuller, *Holy State*.)

CECIL, ROBERT, EARL OF SALISBURY, son of Lord Burleigh, by his second wife Mildred, was born about 1550. He was of a weakly constitution and deformed in his person, upon which account he was not sent to school; he afterwards went to St. John's College, Cambridge. He was knighted by Queen Elizabeth, who sent him as assistant to the Earl of Derby, the English ambassador in France. On his return, in 1596, he was appointed second secretary of state; and on the death of Sir Francis Walsingham, became principal secretary, in which office he continued till his death. He was appointed to various offices of trust by Elizabeth; and on the decease of his father, succeeded him as prime minister. He privately corresponded with James I., and, on his accession, was confirmed in his office. In 1603, he was created baron of Essenden; in 1604, Viscount Cranbourne; and in 1605, Earl of Salisbury; his elder brother Thomas being created Earl of Exeter on the evening of the same day. He was also elected chancellor of the university of Cambridge, and installed a knight of the garter in the same year. In 1608, on the death of the Earl of Dorset, he succeeded to the office of lord high treasurer, in which capacity he effected great reformation in the Exchequer. He was unquestionably the ablest minister of his time, and appears to have repressed the increasing encroachments of the crown to the utmost of his power; but he was of a cold-hearted and intensely selfish disposition, and remorselessly

sacrificed every one who either interfered or appeared likely to interfere with his personal or public schemes. He exposed himself to considerable odium, and made many enemies as the chief promoter of the disgrace and fall of the Earl of Essex, and afterwards of Sir W. Raleigh. Indeed with regard to Raleigh, subsequent inquirers have charged him with criminal and disgraceful conduct; but he was never accused of pecuniary corruption or dishonesty. He married Elizabeth, daughter of William Brooke, Lord Cobham, by whom he had a daughter and a son. Worn out with business, he died at Marlborough, on his road from Bath, where he had been for the recovery of his health, on the 24th of May 1612, observing to Sir Walter Cope—"Ease and pleasure quake to hear of death; but my life, full of cares and miseries, desireth to be dissolved."

He wrote 'A Treatise concerning the State and Dignity of a Secretary of State, with the Care and Peril thereof'; 'A Treatise against the Papists'; and 'Notes on Sir John Doe's Discourse about the Reformation of the Calendar.'

CELOPOPE. [ATHENS, in *Geog. Div.*, I, col. 633.]

CELOPHEUS. [BYZANTINE HISTORIANS, I, col. 1072.]

CELAKOWSKY, FRANTISEK LADISLAW, a Bohemian poet and philologist, was born at Strakonice, a small town about 60 miles W. from Prague, on the 7th of March 1799. When studying at the university of Prague, his enthusiasm for the long neglected language of Bohemia was first aroused by the society of his friends and fellow-students Kamaryt, Chmelovsky, and Vinaricky, all afterwards authors of some note. The first effect of it was that he made a grand auto-da-fé of all he had hitherto written, because it was in the German language. He then commenced an ardent study of the Slavonic languages, and made himself master of them all, as well as of Italian, French, and English, and at this time he made a list of four hundred English words "manifestly of Slavonic origin," says his biographer Maly, which would be of some interest, but does not appear to have been printed. His first publication was a volume of 'Poems,' which was soon followed by a Bohemian translation of Herder's 'Blätter der Vernunft,' or 'Leaves of Antiquity.' We are told by Maly that the time of its appearance, about 1822, was "the period of transition from the old classic to the modern style" in Bohemian literature, and that the translation was "the earliest classical specimen of modern Bohemian prose." A more important production was a collection of Slavonic national songs, 'Slovanské národní písní,' in three volumes (Prague, 1822-27), a publication somewhat resembling the 'Minstrelsy of the Scottish Border.' In 1823 Celakowsky published a translation of the 'Lady of the Lake' into a new kind of poetical prose, somewhat of the Ossianic kind, but this attempt proved a total failure, and the only result of which the writer could be proud was that he received an autograph letter of thanks from Sir Walter Scott, to whom he had presented a copy. He was more successful in his next translation, the 'Ohlas písní Ruskych,' a collection of Russian national songs, so beautifully rendered into the kindred Bohemian that they at once took a very high place in the literature of that country, and still retain it. Russian was at that time the favourite language of Celakowsky, and the Russian nation was high in his esteem, so much so that he lost the friendship of several of his Bohemian acquaintances on the outbreak of the Polish insurrection of 1831, from taking the part of the Russians against the Poles. He had then been for some time the editor of the leading Bohemian newspaper at Prague, a post to which he had been recommended by his patron, Count Chotek, and he was also professor of the Bohemian language at the university. When the Polish insurrection was suppressed however, he disapproved of the severity of the measures adopted by the Emperor Nicholas, and in an article of his paper, compared the proceedings of the Czar to the tyranny of the Tartar khans of the Golden Horde over conquered Russia, in the times of its humiliation under the Mussulmans. The article happened to pass the censorship, but did not elude the vigilance of the Russian embassy at Vienna; a complaint was made to the Austrian government, and the unfortunate writer was at once dismissed from his editorship and his professorship—or in other words was ruined. In a paroxysm of bitterness Celakowsky composed a volume of epigrams against his persecutors, but as might be expected, the permission to print them was refused. He obtained the place of librarian to the Princess Kinsky, and published some poems of a milder character, of which the 'Hundred-Leaved Rose' ('Ruže stolistá') is spoken of as the finest. His fame was at this time widely extended. Dr. Boering, now Sir John, dedicated to him in 1832 his volume of 'Czechian Anthology,' in some stanzas in which he spoke of the kindness Celakowsky had shown him on his visit to Bohemia, and the material assistance he had afforded him in the preparation of the volume. The present King of Prussia was soon after his accession induced, by a reputation of Prague, to found professorships of Slavonic literature at two of his universities, Berlin and Breslau, and Celakowsky was offered the choice of either. He selected Breslau, and removed there in 1832, to enjoy again a competence, but in what appeared to him exile, in a country which had ceased to be Slavonian. He was always eager to greet any Slavonians who came to Breslau, and the time of vacation always found him at Prague. At length the events of 1845, so disastrous to Bohemia, when the general meeting of Slavonic republics at the capital led to its bombardment by Win-

dischgrats, brought about Celakowsky's return to his native country. In the following year a Professorship of Slavonic Philology was instituted at Prague as a concession to the national party, and it was offered to Celakowsky, whose offences were probably considered as sufficiently expiated by his seven years' expatriation. He returned, but his friends perceived that he was not to remain long among them. Always of a somewhat moody character, he was now wild and eccentric; some domestic calamities, particularly the loss of his wife, who left him burdened with a large family of children, had shaken his mind. He died on the 5th of August 1852.

Some of Celakowsky's works have been already mentioned. The most important of those which have not been is his 'Mudroslovi národu slovanského v příslovích' ('The Philosophy of the Slavonic nation in proverbs'), a valuable collection of that nature, which attracted much attention on its appearance after his return to Prague, and to increase which he left large manuscript additions, which are likely to see the light under the editorship of a friend. He had also been for years engaged in collections for a supplement to the valuable Bohemian dictionary of Jungmann, but on an extended plan, embracing a companion with the other Slavonic dialects, as in the great Polish dictionary of Linde. This work is also destined for publication, and it is anticipated will prove a contribution to Slavonic literature of the very highest value.

CELESTI, ANDRE'A (Cavaliere), a very distinguished painter of the Venetian school, was born at Venice in 1637, and died there in 1706. He was the scholar of the Cav. Matteo Ponzoni, but not his imitator. Celesti's works are very attractive, especially in colouring, in which he resembles Paul Veronese: they display also great power both of conception and design, and are remarkable for their costly draperies and general facility of execution. He painted landscape, history (sacred and profane), and genre; cabinet pictures, gallery pictures, and altar-pieces. He is seen to much advantage in the gallery of Dresden, where there are five pictures by him, three of unusually large dimensions, and the figures are the size of life in all. The following three are strikingly rich in colour:—'Bacchus and Ceres,' 'Samson delivered into the Power of the Philistines,' and the 'Murder of the Innocents.' The remaining two are—'The Israelites bringing Offerings for the making of the Golden Calf,' and the 'Sack of a City by Night.' The last is the largest picture in the collection, being very nearly 23 feet long by 13 feet high. Notwithstanding however the attractive colouring of Celesti, his middle tints are often insignificant compared with his lights and shadows; a defect which is attributable probably to his painting upon dark grounds, a practice which prevailed very much in Venice in his time. (Boschini, *Pitture di Venezia*.)

CELESTINE, or CELESTINUS I., bishop of Rome, succeeded Boniface I. in 422, was engaged in disputes first with the African bishops on matters of discipline and ecclesiastical jurisdiction, afterwards with the Pelagians in Britain, and lastly with the Nestorians in the East, on the instigation of Cyril, bishop of Alexandria, a violent anti-Nestorian. Celestinus died in 431, and was succeeded by Sixtus III.

CELESTINE II., a Tuscan, succeeded Innocent II. in 1143, and died, after a five months' pontificate, in 1144.

CELESTINE III. succeeded Clement III. in 1191, crowned the emperor Henry VI., excommunicated Leopold, duke of Austria, and Alonso IX., king of Leon, and died in 1198.

CELESTINE IV., a Milanese, was elected to succeed Gregory IX. in 1241, but died a few days after his election.

CELESTINE V. (Pietro da Murrone) was elected in 1294; a few months after he resigned his office, and was succeeded by Boniface VIII., who confined him in the castle of Fumone, where he died, it is said, of starvation. [BONIFACE VIII.] Celestine V. was canonised in 1313 by Clement V.

CELLARIUS, CHRISTOPHER, born at Smalkald in 1638, studied mathematics and the Oriental languages at Jena. When thirty years of age he was made professor of philosophy and Oriental languages in the college of Weissenfels, and in 1673 was appointed rector of the college of Weimar. Frederic I., elector of Brandenburg, and first king of Prussia, having founded a new academy at Halle in Saxony, appointed Cellarius professor of history and rhetoric, an appointment which he held till 1707, when he died. The work by which he is most generally known is the 'Notitia Orbis Antiqui,' or 'Ancient Geography,' first published at Jena, in a small 12mo, but considerably enlarged in subsequent editions. The best edition is that of Leipzig, 2 vols. 4to, 1731, after the author's death, with additions by Schwarz. This work though it had a value in its day, is now almost useless. The other works of Cellarius are, 'Historia Medii Aevi a temporibus Constantini Magni ad Constantinopolim a Turcis captam,' Jena, 1698; 'Historia Nova, t. e. XVI. et XVII. Saeculorum cum initio XVIII.,' edited by Struve, 1720; 'De Latinitate Medii et Infimae Aetatis, seu Anti-Barbarus;' 'Curse posteriores de Barbarismis ac Idiomatibus Sermionis Latini;' 'Orthographia Latina ex vetustis monumentis excerpta,' 8vo, 1704, reprinted at Padua, 1739; 'Dissertatio Inauguralis Sistens Processum Juris Romani antiquum,' 4to, 1698; 'Horsae Samaritanae, sive excerpta Pentateuchi Samaritanæ versionis, cum Latina interpretatione et annotationibus,' followed by a Samaritan Grammar, 1682; 'Epistolae Samaritanæ Sicheimitarum ad Jobum Ludolfum,' Samaritan and Latin, 1683; 'Origines et Successiones

Comitum Wettinensium,' 4to, 1697. Cellarius published editions of many of the classics, and he also edited 'B. Fabri Sorani Thesaurus Eruditionis Scholastica,' with additions. His Academical Dissertations were published at Leipzig, 1712.

SOLOMON CELLARIUS, his son, born about 1676, died in 1700, was a physician, and wrote 'De Originibus et Antiquitatibus Medicis,' which some have inserted among his father's works. ANDREAS CELLARIUS, a relative of Christopher, wrote 'Regni Poloniæ Regionumque omnium ad id pertinentium novissima Descriptio,' 12mo, Amst., 1659. BALTHAZAR CELLARIUS, a physician, left several medical works. Five or six other German writers named Cellarius (the Latin form of Keller) are mentioned, but none of their works are of any consequence.

CELLINI, BENVENUTO, was born in Florence, in the year 1500. The narrative of his career we abridge from the very remarkable autobiography noticed at the end of the article. His father was desirous that Benvenuto should be brought up to the profession of music, but he showed so decided a preference for the art of design that it was found impossible to keep him from his favourite pursuit, and he was eventually permitted to study sculpture: his first essays were made as a chaser and gold-worker. The elder Cellini however removed his son from the person with whom he was working, and made him apply closely to music till he was 15 years of age, when, without his father's consent, Benvenuto again established himself with a goldsmith called Marcone. In consequence of being engaged in an affray he was banished from Florence, and retired for a time to Siena. He afterwards went to Rome, where he met with great encouragement in his art. He returned however to his native city, and had every prospect of professional success, when, his ardent temper leading him into a quarrel, in which he severely wounded his antagonist, he found it necessary to disguise himself as a friar, and make his escape to Rome. It appears that he still cultivated music, for Pope Clement VII. was so well pleased at hearing him play at a concert that he took him into his service in the double capacity of artist and musician.

The talents of Benvenuto were not confined to the arts of design and music: he distinguished himself in arms, and, according to his own account, was equally able as an engineer. When the Constable Duke of Bourbon laid siege to Rome, Cellini acted as a soldier, and he says it was he who killed the duke as he attempted to scale the city walls. He also signalled himself in the defence of the castle of St. Angelo; and the Prince of Orange, Cellini declares, was killed by a ball from a cannon which he pointed. Soon after this he left Rome, and made his peace with the magistrates of Florence. He next proceeded to Mantua, and through the interest of his friend Julio Romano, the painter, was noticed favourably by the duke; but some indiscretion obliged him hastily to quit Mantua, and he again returned to Florence, where he became intimate with Michel Angelo Buonarroti. At the pope's invitation Benvenuto again went to Rome, where he met with great encouragement, and, among other distinctions, received the appointment of engraver to the mint. In consequence however of the ill-offices and calumny of one Pompeo of Milan, he lost his place, and was even arrested for refusing to give up a work he was engaged upon. A curious instance of Cellini's weakness occurs at this time, in the fact of his devoting himself to necromancy in the hope of recovering his mistress, who had withdrawn to Naples. Having quarrelled with one Benedetto, whom he wounded severely, and being denounced moreover as having killed one Tobia, of Milan, the pope issued orders to have him apprehended, and executed on the spot; but he contrived to make his escape, and succeeded in reaching Naples, where, as the promises of the necromancer had assured him, he met his mistress Angelica. He was kindly received by the viceroys, who wished to keep him in his service, but finding himself deceived by the fair Angelica, or her mother, Cellini quitted Naples, and, under Cardinal Ippolito de' Medici's protection, returned to Rome and obtained the pope's pardon. In 1534 his great patron Pope Clement VII. died; but Benvenuto's well-known talents had now secured him many liberal and powerful friends. He says, in his life of himself, that on his return from St. Peter's where he went to kiss the feet of the dead pontiff, he met Pompeo, who had falsely accused him of the death of Tobia of Milan, and that a quarrel ensued, which ended in his killing his adversary; but he adds, exultingly, he was protected from any evil consequences by the interest of his patrons, the Cardinals Cornaro and Medici; and Paul III., the new pope, desiring to have him in his service, gave him his pardon, and also reinstated him in his situation of engraver to the mint. About this time he unfortunately excited the enmity of Pier' Luigi, the pope's natural son, who endeavoured to have him assassinated, but Cellini having intelligence of the design, made his escape to Florence, where the grand duke received him with every mark of kindness, and appointed him master of the mint. The pope however, anxious to have him in Rome, sent to invite him back, and Cellini again ventured to establish himself in that city; where he remained till he was recommended to try his native air as the only means of recovering from a severe illness. He returned however to the pope's service, and was appointed to carry the presents which were made by his holiness to the Emperor Charles V., on his visiting Rome. Cellini some time after this resolved to visit France, and passing through Padua, visited Cardinal Bembo. On arriving in France he was most graciously received by Francis I., who offered to take him into his service, but being seized with illness

he felt a dislike to the country, and returned to Rome by Ferrara, where he was honourably treated by the reigning duke. On arriving at Rome he was accused by his servant of having robbed the castle of St. Angelo, during the war, of immense treasures, which led to his arrest and imprisonment. He was much persecuted on this occasion by Pier' Luigi, the pope's son, who influenced his father to continue Benvenuto in prison; a resolution in which the pope was confirmed from pique at the French king's intercession in his favour. At length, with great ingenuity, and after considerable difficulties, he effected his escape, and proceeded to his kind friend, Cardinal Cornaro, who received and concealed him for some time; but his eminence being afterwards induced to deliver him up to the pope, he was committed a second time to prison, where he was treated with the greatest severity. He acquaints us, that after he had been confined some time he had a vision, which assured him of his speedy liberation.

At a banquet at which the pope entertained the Cardinal of Ferrara, on his return from the court of France, his eminence succeeded in procuring Cellini's pardon and enlargement, upon which he immediately finished a fine cup for the cardinal, and employed himself in other works—as a 'Venus and Cupid,' 'Amphitrite and Tritons,' and other performances.

He accompanied the cardinal back to Paris, where he met with a most gracious reception from the king, but being offered by the cardinal what he conceived too low a salary for his work, he left Paris abruptly, intending to make a pilgrimage to Jerusalem, and had even proceeded some way when he was overtaken by those sent in pursuit of him and brought back to Francis I. The king settled a handsome salary upon him, and gave him an order to make various large statues for him in silver. But he had now the misfortune to offend Madame d'Estampes, the king's favourite, who did all in her power to disgust him, and to excite the king against him. With this view she encouraged Primaticcio, who was then at the court of France, and set him up as a rival to Benvenuto. He was also engaged in a law-suit, but finding himself, as he says, much troubled and persecuted by the delays of the law, he had recourse to his sword, which intimidated his adversaries, and put an end to the suit. The favourite still continuing to persecute him, he begged permission of the king to leave France. On his return to Florence, the grand-duke Cosmo de' Medici received him with marks of attention, and gave him a studio to exercise his profession in, where he commenced his celebrated 'Perseus;' but being offended at some conduct of the grand-duke's servants, he went to Venice, where he made the acquaintance of Titian, Sansovino, and other celebrated artists. Returning once more to Florence, he proceeded, though slowly, for want of means, with his 'Perseus,' which at last he finished.

On the duke's declaring war against the inhabitants of Siena, Benvenuto was employed to repair the fortifications of Florence.

After his 'Perseus' was exposed to public view, his success was so great that he undertook in gratitude a pilgrimage to Valombrosa and Camaldoli. He was now employed upon many important works. The contest between him and Bandinelli for a statue in marble of Neptune is well known. Cellini intimates that the chagrin caused by the preference given to his design caused the death of the rival sculptor. Notwithstanding this, the duchess, who was Benvenuto's enemy, prevented his having the work, and it was given to Ammannato. He had soon after an opportunity of regaining the duchess's good opinion, by presenting to her and the duke a marble crucifix, a work mentioned and highly extolled by Vasari in his 'Life of Cellini.' He was about this time invited by Catharine de' Medici to go to France, to superintend a monument to the memory of her husband, Henri II., but the grand-duke desiring to retain him in his employment, the queen dowager relinquished her proposal, and Cellini did not again quit Italy. He died in Florence, on the 13th of February 1570, and was buried with great pomp in the church of l'Annunziata.

The works of Benvenuto Cellini may be divided into two classes: the first, for which he is most celebrated, comprises his smaller productions in metal, the embossed decorations of shields, cups, salvers, ornamented sword and dagger hilts, clasps, medals, and coins, in which he showed great skill in composition, and excellence in the details of execution; the second includes his larger works, as a sculptor, and a reference to his bronze group of 'Perseus,' with the head of 'Medusa,' in the Piazza del Gran' Duca in Florence, will be sufficient to illustrate his merit in the higher walk of his art. He also executed some fine portraits.

It might be expected, from the constant employment Cellini had, wherever his uncertain and roving habits induced him to settle even for a short time, that a greater number of his highly-finished works would be found in collections. Their rarity must doubtless be accounted for by the temptation which the intrinsic value of the materials in which he usually exercised his talents offered to tasteless cupidity; and which often no doubt led to the destruction of fine specimens of art for the sake of the gold or silver in which they were worked.

The life of Benvenuto Cellini, written by himself, is, in its class, one of the most curious and interesting biographies extant. It not only contains very full information respecting the life and professional pursuits of an extraordinary individual, and describes all ranks of persons with whom he was connected during a long and busy career,

but furnishes a lively and no doubt tolerably accurate picture of the state of society during the greater part of the 16th century. Cellini's vanity and self-satisfaction, displayed throughout the work, are excessive and highly ludicrous; and, candid or reckless, he does not disguise the excesses into which an ardent temperament and ungoverned passions too frequently urged him. To the dishonour of those who held the reins of government, and especially in the States of the Church, his narrative shows how easily crime was overlooked when the delinquent had talents (either useful or agreeable to his judges) to plead in his behalf, or courtly interest to protect him from the just consequences of a disregard of the laws.

The best edition of Cellini's life is entitled 'Vita di Benvenuto Cellini da lui medesimo scritta, &c. &c. da Gio P. Carpani,' whose notes are valuable, 3 vols. 8vo, 1812. It has been very well translated into English by W. Roscoe. Cellini also wrote a treatise on various branches of his art.

CELSIUS, ANDREW, born 1701, at Upsal, died 1744. He must not be confounded with his father (or uncle), Olaus Celsius, 1670-1756, a theologian, or with his grandfather, Magnus Nicholas Celsius, 1621-1679, a mathematician and botanist. Andrew Celsius joined Mansperhuis and his associates in the measurement of the Lapland degree, and afterwards built an observatory at Upsal. He was the first who employed the centigrade thermometer. He wrote various works, of which it will be worth while to note—1, his astronomical and meteorological observations in the 'Upsal Acta Literaria;' 2, his collection of the aurora borealis observed in his time in Sweden, under the title 'CCCXVI Observationes de Lumine Boreali,' Nürnberg, 1733.

CELSUS, AURELIUS (or AULUS) CORNELIUS, appears to have lived in the Augustan age, but this point is by no means settled; and, as Le Clerc observes, some suppose him to have lived under Tiberius, Caligula, Nero, or even Trajan. Yet the evidence strongly preponderates in favour of his having lived in the age of Augustus and perhaps that of Tiberius. This probability is strengthened by his style, which resembles that of the best writers of the Augustan age. Nor has the profession of Celsius been thought to be perfectly ascertained; for it has been conjectured that he was not a practical physician, but an amateur, who wrote upon physic as forming a part of philosophy. The observations of Celsius however on the most practical points, exhibit such familiarity with the subject, that it is impossible to suppose they could have proceeded from any but an actual physician; and there are several passages in his work which can hardly be supposed to refer to anything but his own practice. Thus after mentioning the method adopted by Heracleides of Tarentum in cases of adhesion of the eyelid to the eyeball, he remarks, that he did not recollect to have seen it successful in a single instance (lib. vii. 7.)

Celsius wrote treatises on agriculture, rhetoric, and military affairs, as well as on medicine; but all have been lost except the treatise 'De Medicina,' and some fragments of his work on rhetoric, published by Sextus Pompeius. The work on medicine consists of eight books: the first gives a brief account of the history of medicine, and of the regimen to be observed by persons of various constitutions; the second, of prognosis and diet; the third, of the treatment of general diseases by diet; the fourth, of the treatment of partial diseases; the fifth, of medicines and diseases to be treated by them; the sixth, of the treatment of local diseases by medicine; the seventh, of surgical operations; the eighth, of the bones, with their diseases, fractures, and dislocations. Hippocrates and Aesculapiades are the chief authors whom Celsius follows. He copies the former when he treats of prognosis and of various surgical operations, where he translates, word for word, a great number of passages; owing to which circumstance he has been called the Latin Hippocrates. But in other points he rather preferred Aesculapiades; whence he has been classed by some in the sect of methodists. But not to mention the perfect impartiality with which he speaks of the three principal sects existing in his time, namely, the empirics, dogmatics, and methodists (lib. i., Pref.), his practice shows that he was not a blind adherent of any party. Celsius merited the praise of an eclectic physician, and followed the sect to which he seems to incline, only so far as they followed nature. In opposition to Hippocrates, but in conformity with Aesculapiades, Celsius rejects the doctrine of critical days, which he supposes to be an offshoot of the Pythagorean numbers. Nor did he copy Hippocrates in the great question of bleeding, which he used far more frequently. Celsius bled in fever when the symptoms were violent, the skin red, and the veins full; in pleurisy; in peripneumony if the patient was strong, but if not, dry cupping was to be employed; in paralysis; in convulsions; in dyspnoea, when it threatened suffocation; in apoplexy; in cases of unbearable pain; in internal contusions; in spitting or vomiting of blood; and in all acute diseases, when he thought that the patient had too much blood. He also bled in cachexia. These instances show that he bled more frequently than Aesculapiades, but not more frequently than many modern practitioners, excepting indeed in the article of cachexia. Celsius used cupping glasses, both with and without scarification; but it is remarkable that he does not speak of leeches, though they were used by Thomson.

As Celsius differed from Hippocrates on the subject of bleeding, so he did likewise on that of purging. After remarking that the ancients purged and administered clysters in almost every disease, he says

that aperients injure the stomach, and that the patient is weakened if the bowels are too much relaxed, either by medicine or clysters; and he recommends the practitioner to abstain from their use in fever.

The first four books also direct the method of employing gestation, friction, baths, fomentations, and the sudorific treatment. As to diet, patients are to abstain from eating and drinking at the beginning of their maladies, but they must afterwards take food in moderate quantities.

Among the numerous remedies contained in the fifth and sixth books, but few are to be taken internally; by far the greater number are unguents, plasters, cataplasms, &c. Among the exceptions are three antidotes; the first is a compound of opium (*Lacryma papaveris*) and aromatics; the second, called ambrosia, and said to have been composed for one of the Ptolemies by Zopyrus, consists of aromatics without opium; the third, again, contains opium, and is the famous Mithridate, by which Mithridates is said to have secured himself against poison.

The seventh and eighth books give a very favourable idea of the progress which surgery had made in the Augustan age. The operation of lithotomy, as described by Celsius, has been much praised and very extensively adopted. Mr. Samuel Cooper observes that it was longer practised than all the other methods, "having been continued to the commencement of the 16th century; and it was performed at Bourdeaux, Paris, and other places in France, on patients of all ages by Raoux, even so late as 150 years ago. Frère Jacques occasionally had recourse to it; and it was successfully executed by Heister (part ii., chap. 140). A modern author recommends it always to be preferred on boys under fourteen." (Allan, p. 12.) ('Surgical Diet.' art. 'Lithotomy.')

Among the most remarkable points in this division of his work we may mention the account of cataract, and the operation with the needle for its cure (lib. vii. 7); the two-fold treatment of goitre by caustic, and extirpation (vii., 18); tapping in dropsy (vii., 15); the restoration of the prepuce in the circumcised (vii., 25); the employment of the catheter (vii., 26); manual delivery in cases where the child is dead (vii., 29); and the treatment of fractures and dislocations in the last book. Nor will the account given by Celsius of the structure of the human body fail to surprise those who have been told that the ancients were ignorant of anatomy.

The princeps editio of Celsius is that of Nicolaus, Florent., 1478. The best editions are those of Krause, Leipzig, 1766; of Targa; of Vallart, Lutet., 1772; the 8vo. edition printed at Leyden in 1746; the one edited by Dr. Milligan, second edit., Edin., 1831, and that by Ritter and Albus, Colon. ad Rhén., 1835. Celsius has been translated into several modern languages. There is a translation into English, with notes, critical and explanatory, by Dr. Grieve, London, 1756, 8vo. (Le Clerc, *Histoire de la Médecine; Dissertation de Celsi vita*, prefixed to Dr. Milligan's edition.)

CELSUS, P. JUVENTIUS, was the son of Juventius Celsus, also a jurist. This Celsus the father is spoken of by Celsus the son, and also by Neratius and Ulpian, in which passages he is always spoken of as Celsus the father. The extracts from Celsius in the 'Digest' are supposed to be from the works of Celsus the son. The son was twice consul, according to Pomponius. ('Dig.' 1, tit. 2.) It is uncertain in what year he was first consul, but his second consulship belongs to the thirteenth year of the emperor Hadrian (A.D. 129), as appears from an extant inscription and a senatusconsultum of that time which is preserved. ('Dig.' 5, tit. 3, s. 20.) Celsius is also mentioned as a member of Hadrian's consilium by Spartianus (a. 18); but he is called Julius Celsius.

The younger Celsus was the author of a work entitled 'Digesta,' in 39 books, as appears from the Florentine Index. He wrote also 'Epistole,' of which the eleventh book is cited by Ulpian ('Dig.' 4, tit. 4, s. 3); 'Commentarii,' of which the seventh book is cited; and 'Questiones,' of which the nineteenth book is quoted in the 'Digest' of Justinian. Celsius is mentioned by Salvius Julianus, his contemporary, and by subsequent jurists. The tendency of his juridical opinions was to the maintenance of equity and fair dealing (*bonum et æquum*). His definition of 'jus' is that it is the "ars æqui bonique," a definition quoted with approbation by Ulpian ('Dig.' 1, tit. 1, s. 1), though it is not a true definition. Celsius said more truly that in cases in which the good and the equitable were matters for consideration, mischievous mistakes were made under the authority of legal science ('Dig.' 45, tit. 1, s. 91), an opinion which is quoted by Paulus, who calls him Celsius Adolescens, apparently to distinguish him from the father.

CENSORINUS, a Latin grammarian, who lived under the emperors Alexander Severus, Maximinus, and Marcus Antoninus Pius Gordianus, who was proclaimed sole emperor of Rome A.D. 238. Censorinus is the author of a small work entitled 'De Die Natali,' addressed to Q. Cereilius, his friend. He treats of the time of the birth of men, and on the influence of the Genii and of the stars on human birth; and he also treats of other matters relating to chronology, mathematics, and cosmography. This is the work of a man who in his day was a man of learning. The style is good for the period. The work is of some value for ancient chronology. Carrio, in his edition, considered the last part of the work, from the 24th chapter, as a separate

treatise of some unknown author, and published it with the title 'De Naturali Institutione.' A treatise on accents by Censorinus is mentioned by Cassiodorus, and one on geometry is also mentioned; but both are lost. A fragment, 'De Metris,' is still extant.

The first edition of Censorinus is probably that of Bologna, fol. 1497. The edition of L. Carrio was published at Paris, 1585, 8vo. The edition of Haverkamp, Leyden, 8vo, 1743, was published after Haverkamp's death by his sons; it contains also the fragments of the satires of Lucilius. The edition of 1767 is the same as that of 1743, with a new title-page. The last edition is that by J. S. Gruber, Nürnberg, 8vo, 1805; the edition of 1810 has only a new title-page.

CENTLIVRE, SUSANNA, was the daughter of a Lincolnshire gentleman named Freeman, who, being a Dissenter and zealous Parliamentarian, was compelled, upon the restoration of Charles II., to seek refuge with his wife in Ireland, in which kingdom it is presumed that Susanna was born, about the year 1680. At three years she lost her father, and before she had attained her thirteenth year she was left by the death of her mother completely an orphan, and according to some accounts utterly destitute. As the scandalous story which Whincop relates of her does not appear to have any foundation in fact we gladly pass over it, and come at once to her marriage at the early age of sixteen to a nephew of Sir Stephen Fox. A twelvemonth had scarcely elapsed before death deprived her of this new protector. But the wit and the beauty which had probably been the only dowry she brought the first, soon procured her a second husband, an officer of the name of Carrol, to whom she appears to have been much attached. About a year and a half after the marriage this gentleman had the misfortune to be killed in a duel, and Mrs. Carrol became a second time a widow. In this state of desolation and distress she first applied to her pen, as well for support as for the amusement of her lonely hours, and several of her early productions were published under the name of Carrol. Among the first was a tragedy, called 'The Perjured Husband;' but the natural bent of her genius being towards comedy, we find but one more serious drama amongst the nineteen which bear her name. Such was her attachment to the stage, says her biographer, that she became herself a performer, but her success does not seem to have been great, and her stay in it was of short duration. In 1706, while sustaining the character of Alexander the Great, in Lee's 'Rival Queens,' at Windsor, where the court then was, she won the heart of Mr. Joseph Centlivre, Yeoman of the Mouth, or principal cook to Queen Anne, and eventually married him. They lived happily together for some years, and she died at his house in Spring Gardens, December 1, 1723. Of her dramatic works, an alphabetical list is given by Baker in his 'Playhouse Companion;' but only three out of the nineteen there enumerated keep possession of the stage—'The Busy Body,' 'A Bold Stroke for a Wife,' and 'The Wonder.' The first was greatly objected to by the actors, and the coarse expression of Wilks the player respecting the play and its author is well known.

CERINTHUS, whence the word 'Cerinthus,' by which his followers were denominated, was by descent a Jew, and born not many years after, if not before, the death and ascension of Christ. His family appears to have been one of those who were settled without the limits of Palestine towards the north. Perhaps he studied in the schools of Alexandria. But of his own history little is known, and the preservation of his name and memory is owing to certain peculiarities of opinion, by which he was distinguished from other followers of Christ, having led to the mention of him in the writings of some of the earliest Christian fathers, and in catalogues which were early formed of Christian heretics. The fathers who especially notice him are Irenæus, Epiphanius, and Theodoret.

Cerinthus was one of those persons who looked upon the doctrine of our Saviour as not intended to supersede the doctrine of Moses and the Scribes, but to be engrafted upon it, and when perfectly received to be taken in union with the doctrine and institutions of his own nation, even to the point of circumcision. This opinion prevailed very extensively in the first age of the Church, as is evident from much of the New Testament. But Cerinthus had some notions more peculiar concerning the creation of the world and the person of Christ. Departing from the simplicity of the Mosaic doctrine, that "In the beginning God created the heavens and the earth," he maintained that the creation was the effect of some angelic virtue, to use the almost unintelligible phrase of the self-called philosophy of that age and nation. He maintained that Jesus of Nazareth was the son of Joseph and Mary, and that at his baptism the Christ, the Son of God, descended upon him in the form of a dove, and became united to him, and that thus it was that Jesus became acquainted with the great unknown Father, and was empowered to work miracles; that at the crucifixion Jesus only suffered, while Christ remained untouched, and leaving Jesus returned to Heaven. These opinions are attributed to him by Irenæus, a very early Christian writer. Authorities less respectable represent him as having denied the resurrection, and as having taught men to expect the reign of Christ for a thousand years on earth, when the saints should delight themselves in all terrestrial enjoyment.

However, he seems by common consent to have been placed among those who held singular opinions in the Christian church, called 'heresies.' Epiphanius names him as one of those who opposed St. Peter and St. Paul. St. John the apostle and evangelist is also

said to have personally opposed him. The following story is told:—The baths in ancient times were places of public resort: St. John, being at Ephesus, repaired to the bath, but happening to find Cerinthus there, he left the place without bathing, observing to his friends, that it was proper to leave it lest the building should fall, so great an enemy to the truth as Cerinthus being within it. This anecdote is related by Irenæus, who says they who told him had it from Polycarp, a contemporary and friend of St. John. Such an anecdote is important, not so much on account of itself as of the way in which it has been transmitted, showing how the writers of the New Testament, and the persons named in it, are connected with the writers and persons of the succeeding age, and they again with the men of the age succeeding them. Irenæus also says that St. John wrote his Gospel with the express intention of confuting the errors of Cerinthus.

CESARI, GIUSEPPE, a celebrated Italian painter, commonly called Il Cavaliere d'Arpino from the birthplace of his father, who was an obscure painter of votive tablets for the images of saints. The elder Cesari settled in Rome, where Giuseppe, or Giuseppino, as he was also called, was born, about 1568. When only thirteen years old, and serving in a menial situation under the painters employed by Gregory XIII. in the loggie of the Vatican, Giuseppe painted some figures by stealth, which led Fy Ignazio Danti, the superintendent of the works, to introduce him to the pope, with whom he eventually became a great favourite, as he was also with four of his successors—Sixtus V., Clement VIII., Paul V., and Urban VIII. He thus enjoyed the highest patronage, and was a great popular favourite, which pleased him better, for more than half a century. He was made a knight of the order del Abito di Cristo by Clement VIII., and was decorated with the order of St. Michel by Henri IV. of France, on the occasion of Henri's marriage with Maria de' Medici. He visited Paris in the train of the Cardinal Pietro Aldobrandini, nephew of Clement VIII., archbishop of Ravenna, and ambassador of the pope at Paris.

Though Cesari's style is extremely superficial, and, with the exception of great animation of composition, scarcely displays a single essential quality of art, he so carried with him the public taste of Rome, that for many years he was without a rival. Annibale Caracci strove in vain to turn the current of public favour, and the rivalry of Michel Angelo Caravaggio himself was of too temporary a nature, and rested upon too feeble a foundation, novelty, to have any permanent effect. Cesari survived them both upwards of thirty years. He died at Rome in 1640, and left a numerous school of imitators behind him; but with his life ended his influence also, for there was not a single painter of ability among his scholars: his brother Bernardino, who was one of his assistants, died some years before him. During the life of Caravaggio, the scholars of that painter formed a strong party against Cesari, and a challenge passed between the two principals, but Cesari declined to cross swords with Caravaggio, as he was not a cavaliere. He however himself sent a challenge to Annibale Caracci, who on his part responded, that his weapon was the pencil, and he would contend with no other. The partisans of Cesari and Caravaggio were called respectively 'Idealisti' and 'Naturalisti.'

The works of Cesari, in fresco and in oil, are very numerous: the chief of them is the series in illustration of Roman history in the Conservatorio in the Capitol, commenced for Clement VIII., but not finished until many years after that pope's death. Cesari undertook to complete the paintings in four years, by the year 1600; he did not complete them however until after a lapse of forty years. They are executed with great spirit, but with an utter disregard of nature; the design is slight and incorrect; the extremities have little variety, and are merely indicated; the draperies also are undefined, the heads want character, and the colouring is flat. The horses, of which there are many in the battles, are better than the figures, yet they are heavy.

(Baglione, *Vite de' Pittori*, &c.)

CESAROTTI, MELCHIORRE, born at Padua in May 1730, studied in the seminary of that city, and showed from his early youth a great taste for learning, and especially for philological studies. Struck by the peculiarity and novelty of the style of Ossian's poems recently published by Macpherson, Cesarotti in 1762 translated Ossian into Italian blank verse: the translation is a fine specimen of Italian versification, being harmonious and fluent, and in many parts highly poetical. Cesarotti broke through the tameness into which Italian poetry had sunk for more than a century before him, and gave the example of a new style and a bolder flight of imagination. He however was not of a mind likely to be restrained within rational bounds. Born in a country then stationary in learning, and brought up among writers tame and timid in their investigations, Cesarotti seems to have determined on breaking through all the boundaries of language, taste, and composition, and attempting to effect a complete revolution in literature. His language is full of neologisms, and he had the hardihood to assert his preference of Ossian's poems to those of Homer. He attempted a version, or, as he called it, a reform of the 'Iliad,' which he styled 'La Morte di Ettore,' in which he took such liberties with his text, that it may be considered as a parody rather than a translation. A caricature appeared at Rome, representing the head of Homer placed on the shoulders of a French dandy, with the legend 'Translation of Homer.' The 'Saggio della Filosofia delle Lingue applicata alla Lingua Italiana,' Padua, 1785, is perhaps Cesarotti's best critical and philosophical work. In it he contends for the necessity of the

written language keeping pace with the progress of ideas, inventions, customs, and new wants and habits. Count Galeani Napione wrote, chiefly in reply to Cesarotti, his work, 'Dell' Uso e dei Pregi della Lingua Italiana,' to which Cesarotti answered by his 'Rischiarimenti e Aggiunte sopra alcune Teorie Preliminari, e sul Francese.' The whole of this controversy may prove interesting to those who wish to form a clear idea of the disputes concerning language, which have formed a considerable part of the Italian literature of our age. Cesarotti was appointed by the Venetian senate to the chair of Greek and Hebrew in the university of Padua. In his quality of secretary to the academy of Padua, he wrote, from 1730 till 1793, 'Relazioni Accademiche,' in which he gave at the end of every year an abstract of the memoirs read by the members of that body; and also 'Elogi di alcune Accademie,' among which the most interesting is that of Abate Oliva, the author of the 'Zoologia Adriatica.' The 'Epistolario,' or voluminous correspondence of Cesarotti, was published in 6 vols. 8vo, Florence, 1811. In 1807 Cesarotti went to Milan, to deprecate the wrath of Napoleon against his countrymen of Padua, who had shown some disposition to resist the conqueror. Napoleon, who was a great admirer of Cesarotti's 'Ossian,' received him in a very friendly manner, made him a knight of the iron crown, and bestowed a pension upon him. Cesarotti in return set about writing the praises of his patron in a poetical composition, full of allegories and metaphysical abstractions, which he styled 'Prona,' the object of which is to show that Napoleon was the envoy of Providence. The 'Prona' was a still-born work, and its name is now only remembered among the many specimens of the flattery and servility of the Italian literary men in Napoleon's time. He also translated several orations of Demosthenes, Isocrates, Aeschines, Lysias, and other Greek writers, and also Juvenal. His essays and dissertations are numerous. Cesarotti died November 4, 1808. His works were collected and published in 42 vols. 8vo, Pisa, 1809; the editors of the 'Classici Italiani' published a selection of them in 4 vols. 8vo, Milan, 1820.

CÉSPEDES, PABLO DE, the most learned artist and one of the most distinguished men of Spain, was born at Cordova in 1538, and was the son of Alonso de Céspedes and Olaya (Arroyo) his wife. After he had received as good a literary and scientific education at Cordova and at Alcalá de Henares as his country could afford, he went, in what year is not known, to Rome, where he devoted himself to the study of the arts, having already paid some attention to painting previously to his departure from Spain. In Rome Céspedes distinguished himself during the pontificate of Gregory XIII. by some frescoes in the churches of Araceli and Trinità de' Monti, and acquired the friendship of Federico Zuccaro, which however some consider to have been a misfortune.

His fame reached his native place, and having been appointed to a vacant canonry in the cathedral, he returned to Cordova in 1577 to fulfil the duties of his office. These duties however did not engross all his time; he persevered in painting, and also bestowed much study upon the history and theory of art, the fruits of which he made known in several valuable essays, the principal of which is a comparison between ancient and modern art, published in 1604—'De la Comparacion de la Antigua y Moderna Pintura y Escultura.' He spent his holidays at Seville, where he collected a museum of ancient works of art; but he did not visit that city after the year 1603. He died at Cordova in 1608, and was buried in the cathedral of that city.

Céspedes was a distinguished Arabic scholar, and was acquainted with Greek and Hebrew. He wrote a history of the cathedral of Cordova; also an account of its martyrs; a poem on painting; a practical and theoretical treatise on perspective; a short treatise on the temple of Solomon; and a short paper upon the various methods of painting adopted by the ancients. His treatise on perspective is lost; and the preservation of his poem, and of the treatise on the ancient methods of painting, is due to Pacheco, who has inserted them in his 'Arte de la Pintura.' Pacheco describes Céspedes as one of the greatest of the Spanish colourists, and the first master of chiaroscuro in the school of Seville. Pons says of him, that had he had the fortune to have been as intimate with Raffaele as he was with Federico Zuccaro, he would have been one of the greatest painters in the world. He excelled chiefly in invention and composition, but was excellent also in all other departments of art. He always, as a rule, made a cartoon before painting a picture, of the same size as the intended picture. There are several of his works in the cathedrals of Seville and Cordova, and in the academy of San Fernando at Madrid. He also practised sculpture and architecture.

Cean Bermudez has inserted in the fifth volume of his 'Dictionary of Spanish Artists' about one hundred pages of fragments from the writings of Céspedes on painting, including the entire poem on painting, which contains 300 lines.

(Cean Bermudez, *Diccionario Historico*, &c.)

CHABRIAS, a distinguished Athenian general, who, in B.C. 388, sailed to Cyprus to assist Eucrates in the reduction of the island (Xen. 'Hell,' iv. 3. 24), of which his father had been deprived by the Persians. In B.C. 376 he gained the sea-battle at Naros. (Demosth. 'Aristocr.' p. 683; Clinton, 'Fast. Hell.'). In B.C. 373 he and Callistratus acted as colleagues of Iphicrates at Cora. (Xen. 'Hell,' vi. 2. 30.) He was despatched to settle the affairs of Thracians in B.C. 360. (Demosth., 'Aristocr.' p. 677.) In B.C. 357 Chabrias and Chares were

sent from Athens with an army to besiege Chios, which, with Rhodes, Cos, and Byzantium, had revolted. (Diodor. Sic., xvi. 7.) Chares led the land forces and attacked the walls from shore. Chabrias no sooner approached the harbour than he engaged in a desperate sea fight; his ship was shattered by the enemy; most of his men escaped, but the general himself preferring, as Diodorus says, a glorious death to a disgraceful surrender, fell fighting. (Diod. Sic., xvi. 7; Corn. Nep., c. 4.)

CHADWICK, EDWIN. In 1854, the Earl of Carlisle, speaking of "the two measures which in our time seemed to him beyond any others to have affected the internal condition of the great body of the people, the Amendment of the Poor-Law and Sanitary Reform," thus expressed himself with reference to Mr. Chadwick:—"He sincerely believed that the most efficient agent in originating and in producing those two great measures, and in clearing away a host of prejudices which beset their early birth, was Mr. Chadwick; and to one or other of these measures he had ever since devoted his time, his health, and his strength. It might undoubtedly be true that in taking up any great question or idea with enthusiasm, a certain portion of positiveness and precipitation might be mixed up with it more than was desirable; but he trusted that our contemporaries would not refuse to those who had established great principles and introduced large measures, some portion of that gratitude and honour which were sure to be awarded to them by an intelligent posterity." (Hansard, July 14, 1854.) The "positiveness and precipitation" which were thus conceded to a passing clamour, as a set-off against contemporary gratitude, have belonged, more or less, to every man whose earnestness has had to struggle with official indifference and procrastination. Mr. Chadwick came from the people. He was not, as Burke said of himself, "swaddled, and nursed, and dandled into a legislator;" and he had to encounter the bitterest hatred of men whose principle was to do nothing till they were forced, and then to do as little as possible. Many of the sanitary measures also with which Mr. Chadwick was connected disturbed various large interests; and he had thus the common fate of all social reformers who are more anxious to enunciate unwelcome truths than careful to conciliate the supporters of profitable errors. Mr. Chadwick has retired from this contest with a distinguished recognition of his merits by the legislature; and it is due to him to present a brief view of his remarkable career, as we believe it will be appreciated by "an intelligent posterity."

Edwin Chadwick was born on the 24th of January 1801, in the immediate vicinity of Manchester. His father was a manufacturer there, but removed southward when his son was about twelve years old. Edwin Chadwick looked to the bar as his profession; but his inquiring disposition led him to the investigation of many political and social questions which were out of the ordinary range of legal studies. That early connection with the newspaper press, which has extended the mental range of many a law-student, was to Mr. Chadwick one of the best means of education. He possessed what is called a statistical bent—a quality not much cultivated thirty years ago, when tables and figures had little to do with political philosophy, and public writers and speakers made the strongest assertions upon the most vague generalities. Mr. Chadwick's comprehensive manner of viewing large questions under many various aspects was first exhibited in 1828, in a paper on 'Life Assurance,' published in 'The Westminster Review.' The principle which Mr. Chadwick maintained in this article was, that the old Northampton Tables, upon which most schemes of assurance were founded, represented the probabilities of life at too low a figure; for as the progress of civilisation had the general tendency to diminish the noxious circumstances by which the population of any locality was surrounded, so in any community in which these noxious circumstances were in course of diminution, human life must have a corresponding tendency to increase in value. The abstract question of the influence of all moral and physical improvements upon health and the duration of life, thus early considered by Mr. Chadwick, was the great problem which he had practically to work out in many years' advocacy and organisation of remedial measures for social evil. In 1829 he wrote two papers in the 'London Review,' one on 'Preventive Police,' the other on 'The Administration of Medical Charities in France.' The article on 'Preventive Police' attracted the notice of Mr. Bentham, and led to a friendship between the young writer and the venerable philosopher, which lasted till Mr. Bentham's death in July 1832.

At this time Mr. Chadwick was preparing for practice at the common law bar, when he was recommended by Mr. Senior as an assistant-commissioner upon the inquiry into the operation of the poor-laws in England and Wales. Mr. Senior was one of the commission. Mr. Chadwick's report—which was printed in the selection from the various reports published in 1833—in the wide range of its investigations, the searching nature of its evidence, the felicity of its illustrations, and the sagacious proofs of the necessity of a most extensive reform, commanded the most general attention; and the importance attached to the views of the writer was demonstrated by his being at once made one of the commission of inquiry. He was called off from this duty to be united in an inquiry into factory labour with Dr. Southwood Smith and Mr. Tooke. But on the government feeling the immediate necessity of a great measure of poor-law amendment, a report, in which Mr. Chadwick materially assisted was presented to parliament

in 1834; the measure was passed, and the Poor-Law Commission was constituted. Mr. Chadwick was appointed by the government as the secretary to the board. From this period for twenty years Mr. Chadwick was connected with the administration of those large measures of local improvement under central regulation whose principles were advocated by him at an early stage of his life, and which he has been ever actively engaged in working out through good report and evil report. Whatever measure he has advocated or organised has been based upon the principle of the union of the central and local control, and the parrot-cry of 'centralisation,' which is still feebly heard wherever local authority is sought to be made an instrument of general good, was always the loudest when the evil to be remedied was most notorious. During this struggle of nearly a quarter of a century, through the labours of Mr. Chadwick in connection with other able and zealous administrators, this once-abused principle has at last come to be generally acknowledged as (to use the words of Mr. Chadwick) "an agency for the removal of those evils in the repression of which the public at large have an interest; next, as an authority of appeal and adjudication between rival or conflicting local interests; thirdly, as a security in the distribution of charges, for the protection of minorities and absentees against wasteful works or undue charges in respect to them; and fourthly, as a means of communication to each locality, for its guidance, of the facts and principles deduced from the experience of all other places from which information may be obtainable."

Mr. Chadwick, during his secretaryship of the Poor-Law Board, took much interest in a special inquiry, conducted by Dr. Arnott, Dr. Kay, and Dr. Southwood Smith, into certain physical causes of fever in the metropolis which might be removed by sanitary measures. He was also associated with the commission for inquiring into the constitution of the constabulary force for England and Wales. The report of this commission, written by him, was presented in 1839. The sanitary inquiry was extended from the metropolis to the country at large, and in 1842 Mr. Chadwick completed the report 'On the general Sanitary Condition of the Labouring Classes in Great Britain.' He prepared a supplementary report on 'Interments.' He was also associated with the labours of several eminent engineers and scientific men on the preparation of two reports upon the questions connected with the water supply and drainage of towns. Mr. Chadwick continued in his position of secretary to the Poor-Law Commission, until the constitution of a new board under the presidency of Mr. Charles Buller. During the latter years of his connection with Poor-Law administration, Mr. Chadwick advocated a more stringent enforcement of the principles of Poor-Law Amendment than were thought expedient; and a new sphere for his exertions was found, in his appointment to the Metropolitan Sanitary Commission in 1847. The importance of this commission became manifest upon the approach of cholera, upon which subject, and upon fever, valuable reports were published in 1847 and 1849. One effect of the report upon an outbreak of fever in the cloisters of Westminster Abbey was the measure for superseding all local bodies having control over the sewerage of the metropolis, placing this authority under one body. In 1848 the Public Health Act of Lord Morpeth was passed, and a General Board of Health was constituted, of which Lord Carlisle was the chief, and Lord Ashley, Mr. Chadwick, and Dr. Southwood Smith, the other members of the board. Mr. Chadwick, in connection with this board, was an important mover of those local measures which have so materially changed the condition of the country. In between one and two hundred towns new works are in progress under these measures. In various model dwellings and separate places where the house and town drainage and other works have been partially executed, there has been a marked reduction of epidemic disease, and in several instances a reduction of mortality from a rate of thirty in a thousand to fourteen and thirteen has been reported, the general average of mortality in the country being twenty-three in the thousand. But, as we have said, these sanitary measures disturbed various large interests; and the government, in bringing forward a bill for the renewal of the Public Health Act, was taken by surprise, and defeated in July 1854 by a small majority. The administration of the Public Health Act was thenceforth charged upon a member of the House of Commons, and a retiring pension was given to Mr. Chadwick. One part of the Poor-Law Amendment Act was directed to the suppression of appointments to local offices, as mere patronage, and the substitution of appointments for special qualifications tested by competitive examinations. Mr. Chadwick's last public paper was one in concurrence with Sir Charles Trevelyan and others, urging the adoption of the principle of competitive examinations as tests of qualifications for appointments to the service of the general government.

The honour of Companion of the Bath was conferred upon Mr. Chadwick during the period of his labours as Commissioner of the General Board of Health.

CHALCONDYLAS LAONICUS. [BYZANTINE HISTORIANS.]

CHALMERS, ALEXANDER, was a native of Aberdeen, where he was born March 29, 1759. His father, who was a printer, and possessed of considerable classical attainments, established the first Aberdeen newspaper. Alexander, after receiving a classical and

medical education, left his native town for Portsmouth, intending to join a West India ship to which he had been appointed surgeon; but suddenly altering his intention he went to London, where he settled and maintained himself by his literary labours. He lived in intimate intercourse with most of the eminent London booksellers and printers of his time, by whom he was almost constantly employed. He died December 10th 1834, aged 75 years. He contributed largely to the political and literary periodicals of the day, and edited a great variety of works. The chief are, 'The British Essayists, with Prefaces historical and biographical,' in 45 vols.; 'Shakespeare,' in 9 vols.; the 'Works of the English Poets from Chaucer to Cowper,' in 21 vols.; a 'History of the Colleges, Halls, and Public Buildings of Oxford,' and a 'General Biographical Dictionary,' in 32 vols.

CHALMERS, DAVID, of Ormond, was born in the shire of Ross about the year 1530. He was bred to the church, and having taken orders at Aberdeen, where he had his early education, he proceeded abroad and studied theology and the laws in France and Italy. At Bologna he was, in 1556, the pupil of Mariannus Sozenus. On his return to Scotland he was successively appointed parson of Suddy, provost of Creichton, and chancellor of the diocese of Ross. He was then employed in digesting the laws of Scotland, and was principally concerned in publishing the acts of parliament of that kingdom, by authority, in 1566.

On the 26th January 1565, he was admitted an ordinary lord of session on the spiritual side, and he was also called by the queen to her privy council. In December 1566, he obtained a charter of the lands of Castleton, and others in the earldom of Ross, from the crown. This grant was ratified by parliament in April 1567, two months after the murder of Darnley, although he was commonly accused of being concerned in that deed. He is said to have afterwards acknowledged his guilt by a precipitate flight to France. (Tytler's 'Craig,' 95.) If so he must soon have returned again; for on the 19th August 1568, he was forfeited for his assistance to Queen Mary, in her escape from Lochleven ('Act. Parl.,' iii. 54); and on the 2nd June that year, his place of a lord of session was given to Robert Pitcairn, commendator of Dunfermline. (Pitmedden Manuscript.)

After the deposition of Mary he retired to Spain, where he was well received by Philip II., and after some stay in that country he went to France, where, in 1572, he presented Charles IX. his 'Histoire abrégée de tous les Roys de France, Angleterre, et Ecosse,' a work which was afterwards enlarged with a History of the Popes and Emperors, and dedicated to King Henri III. In 1573 he published his 'Discours de la Legitimé Succession des femmes, et du Gouvernement des Princesses aux Empires et Royaumes,' which was meant as an answer to Knox's 'First Blast against the monstrous Regiment of Women.' And in 1579 he published 'La Recherche des Singularitez plus remarquable concernment l'état d'Ecosse,' which he dedicated to Queen Mary. He soon afterwards returned to Scotland, and on the 4th of September 1583, was restored by the king to all his lands, offices, and dignities. The remission was ratified by parliament on the 22nd of May 1584, but under proviso that it should not cover "the odious murders of our sovereign lordis dearest fader and twa regents." ('Act. Parl.' iii. 314.) He was never brought to trial for these or any other crimes; and on the 21st of July 1586, he was restored to his seat on the bench. He retained his seat till his death, which happened in 1592.

CHALMERS, GEORGE, was born at Fochabers, in Elginshire, Scotland, about the end of the year 1742. He received his education principally at the university of Aberdeen; and after studying law, he went to the British colonies of North America, where he practised at the bar until the breaking out of the revolutionary war. He then returned to Britain, and settled in London. He wrote 'Political Annals of the United Colonies, from their settlement till 1763;' and 'An Estimate of the Comparative Strength of Great Britain,' which works are said to have introduced him to an official connection with the Board of Trade, which he maintained till his death, May 31, 1825, aged 82 years.

He was the author of 'Caledonia,' a topographical history of North Britain; the lives of De Foo, Thomas Ruddiman, Sir John Davis, Allan Ramsay, Sir James Stuart, Gregory King, and Charles Smith, which were prefixed to editions of, or selections from, their works; and under the name of Oldys, he published a life of Thomas Paine. He also contributed occasionally to periodicals, and published a number of pamphlets, some of them anonymously.

CHALMERS, THE REV. DR. THOMAS, was born at Anstruther, in Fifeshire, on the 17th of March 1780. He was the sixth child of a family of fourteen, born to Mr. John Chalmers, a dyer, shipowner, and general merchant in Anstruther, by his wife Elizabeth Hall. Educated first at the parish school of Anstruther, and next at the University of St. Andrews, he very early displayed powers of no common order—less however in the formal business of the classes, than in his general intercourse with his fellow-students. Having chosen the clerical profession, and gone through the usual theological studies at St. Andrews, he obtained, when yet not past his nineteenth year, a preacher's or probationer's "licence" in the Scottish Church. His first sermon however was preached in England, in the Scotch church in Wigan, on the 25th of August 1799, during a visit to an elder brother. The winter of that year and also that of the next were spent by him in Edinburgh, where he occupied himself in teaching, and also

in attending the classes of Dugald Stewart, Robison, Playfair, and Hope, then in the height of their fame. It was at this time that his passion for mathematics and natural science, as well as his tendency to original speculation on moral and social subjects, first conspicuously revealed themselves. After a period of desultory occupation, first as assistant to the clergyman of Cavers in Roxburghshire, and then as assistant to the mathematical professor at St. Andrews, he was nominated to the living of Kilmany, in his native county of Fifeshire; into which parish he was inducted on the 12th of May 1803. He was then twenty-three years of age, and he continued in the position of parish clergyman of Kilmany till July 1815. These twelve years formed a very eventful period in his mental history. On adopting the clerical profession he had brought into it no very decided views in doctrinal theology. He was attached to what was called the "Moderate," as distinct from what was called the "Evangelical" party of the Scottish Church. He was of opinion too, that by devoting a day or two each week to the preparation of his sermons and to official clerical acts, a clergyman could amply discharge all his proper duties, so as to have the rest of his time at his disposal for whatever other occupations interested him. He carried this view into practice. During the first year of his incumbency he varied his professional work at Kilmany by courses of lectures on mathematics and chemistry at St. Andrews. His preference at this time for professorial over clerical work, and for natural science over theology was indicated by his being candidate in 1804 for the chair of Natural Philosophy at St. Andrews. With even less chance of success he offered himself in the following year as a candidate for the mathematical chair in Edinburgh, vacant by the transference of Mr. Playfair to the natural philosophy chair on Robison's death. Mr., afterwards Sir John, Leslie, obtained the post, and it was with reference to an argument in Leslie's favour urged at the time by Playfair, to the effect that "the vigorous prosecution of mathematical or natural science was incompatible with clerical duties and habits" that Mr. Chalmers made his first literary appearance. In reply to Playfair he published an anonymous pamphlet, vehemently defending the clergy against what he regarded as a "cruel and illiberal imputation"—a pamphlet, the main tenor of which, if not its specific statements, he lived to disown. His next publication was in 1807 when, his thoughts on political economy receiving a stimulus from the agitation caused by Napoleon's decrees against British commerce, he issued a pamphlet entitled 'Inquiry into the Extent and Stability of National Resources.' This publication had success sufficient to inspire him for a time with the idea of coming to London to increase his literary connections. Circumstances preventing him from realising this idea, he continued at Kilmany, with a growing reputation for various attainments, as well as for extraordinary energy, accompanied with some eccentricity, of character and manner. In 1809 he made his first speech in the General Assembly of the Scottish Church—the scene of so many of his oratorical triumphs in after life. In the same year he became a contributor to the 'Edinburgh Encyclopedia' under the editorship of Dr., now Sir David, Brewster; and it was partly to his studies while preparing an article on 'Christianity' for that work, and partly to the colonising effects of a severe illness which, during the winter of 1809-10 brought him to the very brink of the grave, that he attributed the great moral and spiritual change of his life. Then, for the first time, as he thought, he saw Christianity in its true light; and then for the first time also were his views of the duties of the clerical office, as he thought, sufficiently deepened and enlarged. Externally the change exhibited itself in this, that whereas hitherto he had belonged to the "Moderate" party in the Scotch Church then in the majority, he now ranked with the "Evangelical" party, which formed but a minority. But the fruits of the change were more immediately visible in his own altered manner of performing his clerical duties. Not giving up his studies in natural science and in political economy, but carrying them on with the same zeal as before; contributing also to the 'Christian Instructor,' the 'Eclectic Review,' and other periodicals—it was now observed that in all that Mr. Chalmers did the influence of a deep sense of religion, and a conviction of the paramount claims of Christian faith on the thoughts of man, were discernible. Always eloquent in the pulpit, his eloquence now burst forth in strains of such passion and fervour as had never been heard from him before; and from far and near people went to hear the wonderful minister of Kilmany. Bibles and missionary societies, for which he had formerly cared but little, now occupied much of his attention; and, instead of confining his ministerial studies to his weekly sermons from the pulpit, he began a regular organisation of his parish with a view to make himself familiar with the interests of every individual in it, and to provide for all its spiritual as well as intellectual and economic wants. In the midst of these new occupations, which he prosecuted with his constitutional enthusiasm, he married, in 1812, Miss Grace Pratt, the daughter of a retired captain in the army. In 1813 his article on 'Christianity' appeared in the 'Edinburgh Encyclopedia'; and in the same year it was published, with additions, in a separate volume as a treatise on 'The Evidence of Christianity.' The following two years were spent in arduous parochial work, in theological studies, and in the composition of occasional works on various topics, including one on the reconciliation of scripture and geology.

The name of Mr. Chalmers was pretty well known over the south of Scotland as that of a man of powerful mind and extraordinary

eloquence when, in 1815, or in the thirty-sixth year of his age, he was called from his quiet country parish to assume the pastoral care of Tron parish in the city of Glasgow. He remained in Glasgow in all eight years. In 1816 the degree of D.D. was conferred on him by the University of Glasgow. From 1815 to 1819 he was minister of Tron parish. From 1819 to 1823 he was minister of the newly-constituted parish of St. John's. These eight years were the period of his highest celebrity as a pulpit-orator. In this capacity, all Glasgow, and soon all Scotland rang with his fame. One of the most enthusiastic descriptions in Mr. Lockhart's account of Scottish celebrities at that time, published under the title of 'Peter's Letters to his Kinsfolk,' is that given of Chalmers in his Glasgow pulpit. A picture so elaborate and glowing from such a pen of a man whose professed position was simply that of a Presbyterian clergyman of a Glasgow parish, proves that already he was no longer thought of only in that capacity, but as a man of truly great genius. "I know not what it is," said Jeffrey, in 1816, "but there is something altogether remarkable about that man. It reminds me more of what one reads of as the effect of the eloquence of Demosthenes than anything I ever heard." The same impression was afterwards produced on men of all kinds in England, as well as in Scotland—on Hazlitt, Canning, Wilberforce, Hall, and Foster. Part of the secret was that Chalmers was not one of those orators whose power evanesces in the moment of their actual utterance, but a man of massive, large, and substantial thought, whose every speech was the enunciation and illustration of some principle or generalisation, and whose language was full of extraordinary felicities, memorable turns of phrase, and gleams of poetic conception. Perhaps the first exhibition of his oratory in which this union in him of high intellectual attainments and general literary genius with the specific qualities of the orator, was conspicuously brought out, was on the occasion of the delivery, in 1816, of a series of week-day lectures on Astronomy in its connection with Religion. The excitement caused by these 'Astronomical Discourses' was unprecedented; and their popularity, when published in the same year, rivalled that of the contemporary 'Waverley Novels.' But his regular pulpit sermons were no less extraordinary as displays of mental and oratorical power; and on his occasional visits to Edinburgh, London, and other places, his fame as an orator preceded him, and drew crowds to hear him. At Edinburgh his oratory was exhibited not only in the pulpit, but also in debate in the general assembly, or annual ecclesiastical parliament of Scotland. Here as a leader of the "Evangelical" party, then gradually attaining numbers and influence, he took a polemical part in some of the Scotch ecclesiastical questions of the time, and always with the effect of a man at once great in wisdom and resistless in speech. His speeches, like his sermons, were generally read; and very rarely indeed did he speak extempore. With all his extraordinary popularity as an orator, however, no man better appreciated than he did the exact value of such popularity—"a popularity," which, in his own characteristic language, "rides home of its sweets, and by elevating a man above his fellows, places him in a region of desolation, where he stands a conspicuous mark for the shafts of malice, envy, and detraction; a popularity which, with its head among storms, and its feet on the treacherous quicksands, has nothing to lull the agonies of its tottering existence but the hosannas of a drivelling generation." Far more important in his own eyes than these pulpit services which brought him such hosannas, were his practical schemes for showing the social efficacy of Christianity. It was Dr. Chalmers's fixed and lifelong belief that in religion alone was there a full remedy for the evils of society, and that all schemes of social amelioration would be futile which did not aim at working Christianity through the hearts of the people down into their habits and households. Subordinate to this belief was his attachment to the parochial system of social organisation—that system which divides a community into small manageable masses, marked out by local boundaries, and each having a sufficient ecclesiastical and educational apparatus within itself. Disliking with his whole heart the English Poor-Law system, he was of opinion that, if the parochial system were properly worked, pauperism could be provided for without a poor-law at all, by the judicious direction, under clerical and lay superintendence, of private benevolence. In order practically to illustrate these views, he undertook a vast experiment, first with Tron parish, and then with that of St. John's. The population of this latter parish (in which Edward Irving was for some time Dr. Chalmers's assistant) was upwards of 10,000, including perhaps the poorest part of the operative population in Glasgow; but such was his zeal, such his practical sagacity, and such his power of influencing persons fit to be his agents, that in a short time the parish was organised both for economical and educational purposes in a manner unknown before, schools being set up in every part of it, and the poorest lanes visited periodically each by its own special teacher and inspector. The results of his experiment, with his speculations in connection with it, were published by him (1819-1823) in a series of quarterly tracts, on the 'Christian and Civic Economy of Large Towns'; which, with two volumes of 'Sermons,' published respectively in 1818 and 1820, two articles on 'Pauperism' contributed to the 'Edinburgh Review' in 1817, and a sermon in the same year on the Death of the Princess Charlotte, formed, along with the 'Astronomical Discourses' already mentioned, his chief literary exertions during his residence in Glasgow.

In the midst of the bustle and fatigue of his life in Glasgow, increased ten-fold by the hospitality which his celebrity obliged him to exercise, Dr. Chalmers had never ceased to sigh for the academic quiet of a professor's chair in one of the Scottish universities; and in January 1823, much to the surprise of the public, he resigned his charge, and accepted the chair of Moral Philosophy then vacant in his native University of St. Andrews. The new post was one of much less emolument, and of far less publicity than that which he had resigned; but even had his tastes not disposed him to accept it, he had paramount reasons in the state of his health, which was giving way under the wear and excitement of city-life. Forty-three years old when he accepted the chair, he retained it till his forty-ninth year, or from 1823 to 1828. The winters of these five years were spent by him in the preparation and delivery of his class-lectures, and in the genial society of many of his old friends; but he carried with him to St. Andrews those notions and schemes of Christian philanthropy which he had matured in Glasgow, and the little Fifeshire town felt during these five years the vivifying influence of his spirit and enthusiasm. Occasionally he preached in St. Andrews and in the neighbourhood round; annually in May he visited Edinburgh to take part in the business of the General Assembly, where his eloquence as before was felt as a conquering force on the "Evangelical" side in all the great ecclesiastical controversies of the time; and excursions in Scotland and Ireland, and journeys as far as London, varied his summer. It was proposed at one time to elect him to the Moral Philosophy chair in the newly-established University of London; but this proposal, which might have altered the whole tenor of his future career, was not carried out. The literary results of his five years' sojourn at St. Andrews were courses of 'Lectures on Moral Philosophy,' and on 'Political Economy,' prepared for his class and reserved for publication; a third volume of his 'Christian and Civic Economy of Large Towns,' published in 1826; and a treatise on 'Ecclesiastical and Literary Endowments,' published in 1827.

Dr. Chalmers's next appointment was to the chair of Divinity in the University of Edinburgh. The duties of this office he assumed in 1828, and he discharged them during fifteen years—i. e. from 1828 to 1843, or from his forty-ninth to his sixty-third year. His activity during these fifteen extraordinary years of his life (not taking account of his occasional sermons) was made up of three distinct kinds of work—his duties as theological professor; his continued exercises in literature, speculation, and schemes of Christian philanthropy; and his controversial energy in connection with the serious ecclesiastical struggle which during that time convulsed Scotland. 1. *His Labours as Theological Professor.*—In this important capacity, which involved the theological instruction and training of between one and two hundred young men annually for the Scottish Church, Dr. Chalmers exerted a vast influence, less as a man learned in theological lore, than as a man of noble purpose and burning enthusiasm with whom no young man could come in contact without love and veneration, and who was in the habit not only of communicating massive thoughts of his own on almost all subjects, but also of stirring up thought in others. His class-room was truly a centre of life and intellectual influence; and those who went forth from it carried with them the perfume much of his spirit and many of his views. 2. *His independent labours in literature, speculation, and Christian philanthropy.*—Of these it is impossible to take full account; suffice it to say that in 1831 he published his treatise on 'Political Economy,' and in 1833 his Bridgewater treatise 'On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man;' that in 1838 he delivered in London, and afterwards published, a series of 'Lectures in Defence of Church Establishments;' that in the following year he made a tour through Scotland to advocate the cause of church extension; that in 1841 he published a volume on 'The sufficiency of the Parochial System without a poor-rate for the right management of the Poor;' that during the same period he delivered, during the summer vacations various lectures to popular audiences on topics of natural science; and that he gave much of his time to the superintending of an attempt to carry out his notions of proper parochial management in one of the poorest districts of Edinburgh. Some of the labours here mentioned received public recognition, in the form of honours conferred upon him. Thus in 1830, he was appointed one of the king's chaplains for Scotland; in 1834 he was elected a Fellow of the Royal Society of Edinburgh, and a corresponding member of the French Institute; and in 1835 he received the distinction of Doctor of Laws from the University of Oxford. 3. *His connection with the Scotch Church Controversy.*—The "Evangelical" party with which, since 1810, Dr. Chalmers had been so permanently connected, had gradually increased in the church, so as at last to attain the majority; and in 1832, Dr. Chalmers was elected to the moderatorship, or presidency, of the General Assembly of that year. In 1834 the Assembly, under the auspices of the ruling party, and with his advice and sanction, passed the famous "Veto Act," the design of which was to modify the action of the system of patronage of livings in the Church of Scotland, by enabling the Church Courts to reject any nominee of a patron on the ground of his being displeasing to the majority of the congregation or parishioners over whom he was appointed. Several nominees having in immediately subsequent years been rejected in accordance with this act, appeals were made to the Civil Courts of Scotland and to

the House of Lords, and the result was that the Veto Act was declared to be contrary to the law of the land, and that not only were nominees rejected by it pronounced to be entitled to all the emoluments of the livings, but that it was pronounced illegal in the church to appoint any other clergymen to the spiritual cure of the parishes in question. Thus arose a controversy which agitated Scotland throughout its whole extent for ten years; and in which the original question of the "Non-Intrusion" of clergymen upon unwilling congregations was merged in the question of the proper relations between Church and State. Of this controversy Dr. Chalmers was, on one side, the chief champion; and for several years he was incessantly occupied in defending his view of the questions in dispute in speeches and through the press, both against the "Moderate" party in the church itself, who had from the first opposed the Veto Act, and also against the civil courts and the government. More than once it seemed as if the legislature was on the point of devising some means of healing the breach which had been made, and restoring quiet to Scotland; but at last, these hopes being over, the struggle was ended at the meeting of the General Assembly on the 18th of May 1843, by the so-called "Disruption"—i. e. by the voluntary secession of upwards of 400 clergymen, followed by a large portion of the people of Scotland from the Established Church, and the institution of a new ecclesiastical body called "the Free Church." At the head of this secession was Dr. Chalmers, who was nominated moderator of the first General Assembly of the new church.

The last four years of Dr. Chalmers's life were spent by him as Principal and Professor of Divinity in the New College founded by the adherents of the Free Church for the theological education of its ministers (his chair in Edinburgh University having been necessarily vacated by him on his secession from the establishment). During these years, too, he exerted himself prodigiously in arranging the organisation of the new church, and in raising funds for its support; and probably at no period of his life was the statesman-like character of his intellect, his power of dealing with new social emergencies and of leading men, more conspicuously shown. He had seen the foundations of the new church laid very much to his mind, and was preparing to resign the farther work of completing its organisation into the hands of his many able and younger colleagues, and to devote the rest of his days to his labours as a theological professor, to Christian and philosophical literature in connection more immediately with the 'North British Review,' then started under his superintendence, and to a new experiment of Christian philanthropy which he had begun in one of the most wretched quarters of the old town of Edinburgh, when death removed him. He had just returned from a visit to England in apparently excellent health and spirits, to take part in the proceedings of the General Assembly of the Free Church, when on the morning of the 31st of May 1847, he was found dead in his bed at his house at Morningside near Edinburgh. His death was felt throughout Scotland like a national shock; and all ranks and parties joined in doing honour to his memory as one of the greatest men that Scotland had produced. He left a widow who did not survive long, and six daughters, one of them married to the Rev. Dr. Hanna, under whose superintendence a new issue of the collected works of Dr. Chalmers has been put forth in twenty-five volumes, and who has also written his life in four volumes, and edited much of his correspondence.

Dr. Chalmers was a man of powerful frame, not tall, but massively built; his head was very large. It was remarkable in a man so celebrated over Britain as an orator, that he always spoke not only in a broad Scottish, but also in a broad provincial Scottish accent, mispronouncing almost every word. Personally he was a man of most simple, bland, and sociable manners, with a great fund of anecdote and broad humour. His works, notwithstanding the force of intellect that they show (and his speculations in social and political economy, in particular, are valued by many of the best thinkers of the day who have no sympathy with his theological or ecclesiastical opinions), but faintly convey an idea of what the man was while he lived, and of what he still is in the memory and imagination of the Scottish people.

CHALONER, SIR THOMAS, father and son. The elder Sir Thomas Chaloner was born in London about 1515, and educated at Cambridge. He was sent, when a young man, with Sir Henry Knevet, to Germany, and attracted attention in the court of Charles V. He accompanied Charles on his expedition to Algiers, was shipwrecked off the coast of Barbary, and narrowly escaped drowning. On his return to England, he was employed about the court, and was knighted for his conduct at the battle of Musesburgh, in the year 1547. The fall of his patron, the Duke of Somerset, affected his fortunes; but on the accession of Elizabeth, he was sent as ambassador to Ferdinand I., emperor of Germany, and was also employed in a similar capacity in Spain. He died October 7, 1565, and was buried in St. Paul's. His literary productions consist of a large collection of poetical pieces in Latin, and some prose works, one of which is 'On the right ordering of the English Commonwealth.' He appears to have been highly esteemed by his contemporaries as a brave, able, and worthy man.

Sir Thomas Chaloner, the son, who inherited a considerable portion of his father's abilities, was born in 1559. To him is attributed the discovery of the alum-mines near Whitby, in Yorkshire, the first that were worked in England; he, at all events, has the merit of having

established the working of the mines. Towards the end of Elizabeth's reign, he went into Scotland, and rose so high in James's favour as to be afterwards appointed the guardian or governor of Prince Henry, with the control both of his education and household, an office which he seems to have creditably discharged. He died November 17, 1616. His only literary production is 'A short Discourse of the most rare and excellent virtue of Nitre.'

One of his sons, Edward, entered into holy orders, and became principal of St. Alban's Hall, Oxford. He published several sermons, and a treatise on the 'Authority, Universality, and Visibility of the Church.' Two others, Thomas and James, were members of the Long Parliament, and sat as judges on the trial of Charles I. James Chaloner is the author of a 'Description of the Isle of Man,' printed in the original edition of King's 'Vale Royal,' though the work has been also attributed to another James Chaloner, a native of Chester. Thomas Chaloner was the author of several political pamphlets, which appeared during the civil war.

CHAMBERS, EPHRAIM, editor and chief compiler of the 'Cyclopædia' which bears his name, was born at Kendal in the latter part of the 17th century. His father was a small freeholder in Westmorland, in respectable circumstances. Ephraim, his eldest son, was bound apprentice to a mechanical trade in London. Eventually he became apprentice to Mr. Senex, the globe-maker; and it was while in his shop that he conceived the design of the 'Cyclopædia' which has chiefly preserved his name. Some of the articles are said to have been written by him while he stood behind the counter. Before the completion of the work however, but probably after he had made arrangements with the bookseller who published it, he left Mr. Senex, and took chambers in Gray's Inn. The first edition of the 'Cyclopædia' appeared in 3 vols. fol. in 1728, and was very favourably received. It was published by subscription, the price of each copy being four guineas. Immediately after, the author was made a Fellow of the Royal Society. A second edition of the work appeared in 1738, and a third in 1739. Mr. Chambers was also one of the writers in the 'Literary Magazine,' an analytical review of new works, which was begun in 1735, and continued for some years. He was likewise associated with Mr. Martyn, the botanical professor at Cambridge, in translating and abridging the 'Philosophical History and Memoirs of the Royal Academy of Sciences at Paris,' which appeared in 5 vols. 8vo, in 1742. This task he executed very ill. The only other literary work which has been attributed to him is a translation from the French of a quarto volume, entitled 'The Jesuits' Perspective.' He lived to the last the life of a recluse and a hard student, reading and writing from morning to night almost without intermission. A person who was his amanuensis for six years is said to have related that he transcribed for him, and took down from his dictation in that space of time, not less than twenty large folio volumes, containing as much matter as, if it had been printed, would have made thirty such volumes as those of his 'Cyclopædia.' He died on the 18th of May 1740 at Canonbury House, Islington, and was buried in Westminster Abbey, under a short Latin inscription of his own composition. A fourth edition of his 'Cyclopædia' appeared in 1741, and a fifth in 1746. To the sixth edition, which was brought out in 1750, were added two supplementary volumes, which were compiled by Sir John Hill, the botanist, and George Lewis Scott, the mathematician. These, along with much new matter, were incorporated with the original work in a seventh edition, which began to be published in numbers under the superintendence of the late Dr. Abraham Rees in 1778, and was completed in 4 vols. folio, in 1785. Chambers's work is also avowedly the basis of the greatly more extended 'Cyclopædia' in the conduct of which Dr. Rees afterwards engaged, and which he lived to complete in 45 vols. 4to. (London, 1802-1819). Indeed it may be said to have originated all the modern Cyclopædias, both in the English and in other European languages. It was early translated both into French and Italian. In the prospectus of the great French 'Encyclopédie' of Diderot and D'Alembert (afterwards incorporated in the 'Discours Préliminaire'), it is admitted that Chambers's plan is excellent, though the execution of the work is very indifferent. The writers add, that it possibly never would have appeared at all, if there had not previously existed in the French language works from which Chambers drew, without measure and without choice, the greater part of the matter which composed his dictionary.

CHAMBERS, GEORGE, marine painter, was the son of a poor seaman of Whitby in Yorkshire, where he was born towards the close of the last century. After he had attended for a short time the free school of his native town, he was sent, at the age of ten years, to sea in a small trading sloop, in which he served as cabin-boy for two years. He was afterwards bound apprentice to the master of a brig which traded in the Mediterranean and the Baltic seas. During this apprenticeship he gave evidence of that talent for which he was subsequently distinguished, by making sketches of various descriptions of shipping, for the amusement and gratification of the captain. His master, Mr. Storr, appears to have been induced by these efforts to cancel his indentures, and Chambers worked his way home to Whitby in another vessel, with the determination of becoming a painter of ships. At Whitby he knew no better way of making himself acquainted with colours than by apprenticing himself to an old woman who kept a painter's shop. But at the same time that he was plodding his way

through the business of a house-painter, he took lessons from an obscure drawing-master of Whitby, of the name of Bird, and applied what time he had to spare in painting small pictures of shipping, for which he found at his humble prices a ready market. He carried on this life for three years, when, being anxious to visit London, he again entered the seafaring life, and worked his way as foremast-man in a trading vessel to the great metropolis.

In London, though very poor, he refused an offer of employment as a journeyman house-painter at thirty shillings per week, being bent upon painting shipping; and he soon after contrived to obtain considerable employment in the representation of ships. Having obtained however an introduction to Mr. Horner, that gentleman employed him for seven years on the great panoramas of London at the Colosseum. At the completion of this work he was engaged as scene-painter at the Pavilion Theatre. While at this theatre some of his works attracted the notice of Vice-Admiral Lord Mark Kerr, who became Chambers's sincere patron, and procured him an introduction to King William IV. and Queen Adelaide. The king chose a sea-fight, and the queen chose a calm coast-scene near Dover. Chambers painted also a view of Greenwich Hospital for the queen, and the 'Opening of New London Bridge' for the king; and he received the appointment of Marine-Painter to their Majesties.

He was now reaping the fruits of his persevering industry. He had given up his appointment as scene-painter to the Pavilion Theatre, and he was in a fair way of establishing fame and fortune together; but a constitution originally very weak, and much shattered by a seafaring life, was unable to bear the incessant application his ambitious mind subjected it to, and he gradually fell into a disease which proved fatal to him. He died in October 1840.

Chambers was a member of the Society of Painters in Water-Colours. His chief productions however are his naval battles in oil, in which he was excellent, especially in the construction and rigging of his ships, though in his colouring there is an unnatural redness of effect pervading everything, the smoke in particular. There are in the hall of Greenwich Hospital three battles by Chambers—'The Bombardment of Algiers by the Squadron led by Viscount Exmouth, G.C.B., in 1816,' presented in 1836 by the admiral's friends; 'Portobello taken by Admiral Vernon and Commodore Brown in 1759,' presented in 1839 by E. H. Locker, Esq., commissioner; and a copy of West's picture of the 'Destruction of the French Fleet in the Port of La Hogue by Vice-Admiral Sir George Rooke, Kt., in 1692.'

(*Art-Journal; Catalogue of the Naval Gallery of Greenwich Hospital.*)

CHAMBERS, SIR WILLIAM, is said to have derived his descent from a Scotch family of the name of Chalmers, who were barons of Tartan in France. He was born however in 1726 at Stockholm in Sweden, whither his grandfather, an eminent merchant, had proceeded some time before to prosecute certain claims he had upon the government of that country. At two years of age he was brought to England, and put to school at Ripon in Yorkshire. We next read of his making a voyage to China as supercargo, in the service of the Swedish East India Company. This must have been when he was a very young man, for at the age of eighteen he is said to have settled in London, and taken up the profession of an architect and draughtsman. In these capacities, having no formidable rivalry to encounter, he soon obtained considerable reputation. At length he was introduced to the Earl of Bute, and by his influence appointed drawing-master to the young Prince of Wales, afterwards George III. Soon after the accession of that king he was employed to lay out the royal gardens at Kew. In this task he displayed without restraint that predilection for the Chinese style, both of gardening and architecture, of which he had already given intimation in a work, entitled 'Designs for Chinese Buildings,' published in 1759. In 1765 he published in a large folio volume, 'Plans, Elevations, Sections, and Perspective Views of the Gardens and Buildings at Kew, in Surrey.' Meanwhile he had also, by a villa in the Italian style, which he erected at Richmond for the Earl of Besborough, and by various other buildings, obtained much reputation and employment as an architect. In 1771 he was made a knight of the Swedish order of the Polar Star. In 1772 he published his 'Dissertation on Oriental Gardening.' This is another vindication of Chinese tastes and fashions, and is memorable as having exposed the author to the satiric lash of the poet Mason; to the first part of whose 'English Garden,' published immediately before, it was suspected to be intended as a sort of answer and confutation. The piece in which Mason took his revenge (if indeed he was the author, which he never acknowledged) was the famous 'Heroic Epistle to Sir William Chambers, Knight, Comptroller General of his Majesty's Works, and author of a late "Dissertation on Oriental Gardening;" enriched with explanatory Notes, chiefly extracted from that elaborate performance.' This production appeared in 1773, and was followed in 1774 by a short continuation, under the title of 'An Heroic Postscript.' In 1775 Sir William was appointed to superintend the rebuilding of Somerset House, which is his best work. In 1791 he published his 'Treatise on Civil Architecture,' which has been several times reprinted. Sir William died on the 8th of March 1796, leaving a large fortune. As an architect, although his taste was fantastic, he frequently showed considerable ingenuity, and also displayed a certain grandeur in his designs. His staircases in particular used to be much admired. After Somerset House, among

Chambers's most successful efforts, are the mansion which he built for the Marquis of Abercorn at Duddingstone, near Edinburgh, and Milton Abbey in Dorsetshire, which he built in the gothic style for Lord Dorchester.

*CHAMBERS, WILLIAM and ROBERT, the well-known publishers of Edinburgh, claim a notice here as among the most zealous and successful labourers in the great effort which has been made during the past thirty years, to place sound and wholesome literature within the reach of all classes of the population of this kingdom. The eldest children of a respectable pair settled at Peebles in the south of Scotland, William was born in 1800, his brother Robert in 1802. They received a good school education in their native town, Robert passing through a complete classical course, and showing from his earliest years a great love of study, while William was of a more practical turn of mind. Through the misfortunes of their father in business, they were thrown in mere boyhood on their own resources. The family having removed to Edinburgh, William was apprenticed to a bookseller there. Robert, failing to get to college as had been designed, made what most people would have thought an eccentric movement, and entered at sixteen on an important career as a bookseller, with very small means. The early struggles of the two young men would form a remarkable narrative as an example of self-relying energy and industry. They conducted separate concerns in Edinburgh till 1832, when they united in starting their well-known popular periodical, 'Chambers's Edinburgh Journal.' Before this time Robert had written his 'Traditions of Edinburgh,' and contributed several popular histories to Constable's 'Miscellany.' He had also for some years conducted a newspaper in Edinburgh. His attention to the antiquities of Edinburgh had early gained him the notice of Sir Walter Scott (who in his diary terms him "a clever young fellow—but hurts himself by too much haste"), Charles Kirkpatrick Sharpe, and other eminent natives, who took an interest in the stories of the Old Town. William Chambers had meanwhile published a laborious work entitled the 'Book of Scotland.' From 1832 their united career as publishers has been marked by distinguished success.

As soon as the success of the 'Edinburgh Journal' became apparent, (in 1834 its sale had reached 50,000 copies), the brothers gave up their separate places of business, and formed one establishment in the High-street, which has gone on increasing in extent till it has grown to be one of the most remarkable printing and publishing houses in Scotland. The facilities which their extensive printing machinery and their organisation for the circulation of the 'Journal' gave them, Messrs. Chambers were not slow in turning to account in the publication of various cheap works of a popular and instructive character. Among the most important of these have been their 'Information for the People,' 'Popular Library,' 'Instructive and Entertaining Library,' 'Repository of Instructive and Entertaining Tracts,' 'Miscellany,' 'Educational Series,' &c. That their works were well calculated to meet a popular want is evidenced by the remarkable extent of the circulation of many of them. In statements published in their 'Journal,' Messrs. Chambers say that the sale of the numbers of the 'Information for the People' averaged about 130,000 copies; while the 'Miscellany of Useful and Entertaining Tracts' sold from 150,000 to 200,000 copies, some particular numbers nearly reaching 300,000 copies.

Mr. Robert Chambers we have said early devoted much attention to literature. His principal works are the 'Traditions of Edinburgh,' already mentioned; 'History of the Rebellion of 1745-46;' 'Popular Rhymes of Scotland;' 'Life and Works of Burns;' and his 'Essays,' in 4 vols., selected from the 'Journal.' Much of his leisure time has been devoted to scientific pursuits, and especially to geology, the result of which has been given to the public in a handsomely-illustrated volume entitled 'Ancient Sea-Margins, as Illustrative of Changes of the Relative Level of Sea and Land,' and in occasional papers published in the scientific periodicals.

Mr. William Chambers also contributed many essays to the 'Journal,' but we believe the only separate works published with his name, were his 'Book of Scotland,' and a brief notice of a tour in Holland, until a year or two back, when he wrote an account of his impressions of a tour in the United States, which, having first appeared in the pages of the 'Journal,' was subsequently issued in a revised form as a distinct work under the title of 'Things as they are in America.' He has since published a short notice of 'Peebles and its Neighbourhood,' and 'Improved Dwelling-Houses for the Humble and other Classes in Cities;' the latter being suggested, it is said, by his experience during the last few years in improving the dwellings of his tenantry on an estate he purchased near Peebles, the cultivation and improvement of which has formed a pleasant occupation of his well-earned leisure.

CHAMBRAY, COUNT DE. [BORDEAUX, DUC DE.]

CHAMBRAY, GEORGES, MARQUIS DE, was born at Paris in 1783. The De Chambray family was one of the oldest in Normandy, but was ruined by the revolution. The young Chambray was educated at the École Polytechnique. He entered the artillery, and served in the German campaigns of 1806-9, in the course of which he rose to the rank of captain. In the disastrous Russian campaign he served as captain in the imperial artillery; but in the retreat he was left sick at Wilna, where he fell into the hands of the Russians, who sent him into the Ukraine. After the fall of Napoleon in 1815 he returned to France, and was made a major in the garde royale. By 1825 he had

risen to the rank of colonel-director of the artillery of Perpignan; but his health had never wholly recovered from his sufferings in Russia, and he was at length (1829) permitted to retire from the service with the honorary title of *maréchal-de-camp*. Relieved from his military duties, M. de Chambray immediately set about the composition of a work he had for some time meditated, on the Russian campaign, and in the composition of it he had the advantage, besides his own experience, of having access to the documents in the war office as well as to the private papers of officers who had shared like himself in the events he had to narrate. It appeared in 1833 in 2 vols. 8vo, with an atlas, under the title of '*Histoire de l'Expedition de Russie*.' The great importance of the work was at once recognised, and the notices which it called forth in other countries as well as in France, led M. de Chambray to carefully revise it for another edition, which was published in 1829 in 3 vols. 8vo; and subsequently (1835) to add two new chapters. M. de Chambray also published a '*Réfutation de la brochure intitulée—la vérité sur l'incendie de Moscou, par le comte Rotopshin*;' as well as various pamphlets on infantry tactics and other subjects connected with military affairs, reviews of Jomini, and Carion Nisas, and a life of Vauban, all of which have been collected and published under the title of '*Mélanges*.' (Rabbe, *Dict. Port. des Contemp.*; *Nouv. Biog. Univ.*)

CHAMISSO, ALDELBERT VON, a distinguished poet, naturalist, and traveller, was born on the 27th of January 1781 in the château of Boncourt in Champagne. He belonged to a very ancient noble family of Lorraine. Until the outbreak of the French revolution the family lived quietly on their estate, and Adelbert's brother Charles was one of the pages of Louis XVI., to whom he remained faithful to the last, and for whom he risked his life on several occasions. In 1790 the château Boncourt was razed to the ground, whereupon the family of the Chamissoes quitted France; and after having wandered about in the Netherlands and the south of Germany they ultimately went to Berlin in 1796, where, together with other French emigrants, they took up their permanent residence. As they had lost all their property, the whole family lived upon the little income which two of the sons made by painting miniature portraits. Adelbert however was extremely fortunate: the Queen of Prussia made him one of her pages, and took great care of his education, which he received in one of the gymnasia of Berlin. He made himself thoroughly acquainted with the German language and literature, and the spirit which pervades all his own literary productions shows that he became so completely Germanised that the peculiarities of the German mind, which are most foreign to the French, were in him most prominent. In 1798 he entered the Prussian army, and his parents accepting the offer of Napoleon, then First Consul, returned to France. Shortly after this he began writing poetry in German, and from 1804 to 1806 he edited a '*Musen-almanach*' conjointly with Varnhagen von Ense. After the peace of Tilsit, Chamisso quitted the Prussian service; and in 1810 he returned to France, where his family had recovered a great part of their property. For a short time he was teacher in a school at Napoléonville, but his personal feelings and the friendships he had formed in Germany drew him back to that country. He now devoted himself almost entirely to the study of the natural sciences. In 1818 he wrote for the amusement of the children of a friend a little book called '*Peter Schlemil*,' containing the story of a man who loses his shadow. This amusing little work, which has been translated into English and most other European languages, was first published in Germany by Chamisso's friend De la Motte Fouqué (1814), which has led some persons to look upon it as the production of Fouqué. A second edition, accompanied by some lyric poems and ballads, was published by the author himself in 1827. In 1814 Count Rumjanzow, chancellor of the Russian empire, prepared an exploring expedition round the world at his own expense. He invited Chamisso to accompany the expedition as naturalist, and the invitation was gladly accepted. In 1815 Chamisso embarked at Cronstadt under Captain Kotzebue, and returned thither in 1818. One of the main objects of the expedition had been the discovery of a north-east passage, in which the expedition failed; but in all other respects the discoveries were highly satisfactory. An account of the voyage was published by Kotzebue in two volumes, and Chamisso himself published '*Bemerkungen und Ansichten auf einer Reise um die Welt*,' Weimar, 1821, 4to, which forms an indispensable supplement to Kotzebue's work, and contains a most faithful account of everything that came within the range of his personal observation. After his return from this voyage Chamisso again took up his residence at Berlin; the university conferred upon him the degree of Doctor in Philosophy; he became a member of the Royal Academy of Sciences, and soon after he received the appointment of inspector of the botanical gardens of the same city. While in this situation he wrote a botanical work, '*Uebersicht der in Norddeutschland vorkommenden nützlichsten und schädlichsten Gewächse, nebst Ansichten über das Pflanzenreich und Pflanzenkunde*,' Berlin, 1827. These subjects however did not estrange him from the cultivation of poetry, for during the last ten years of his life he produced a great number of small poems, many of which, especially his popular legends and ballads, belong to the best productions of the kind in German literature. He died on the 21st of August 1838 at Berlin. His poems were collected and published separately, Leipzig, 1831, in 1 vol. 8vo, and a second edition appeared in 1834. A collection of all his works, both in prose and in verse, was

published at Leipzig in 4 vols. 8vo, 1835, and a second edition in 1842 in 6 vols. 12mo, the two last of which contain Chamisso's life and correspondence, edited by J. E. Hitzig.

CHAMPAGNE, PHILIPPE DE, was born in Brussels in 1602. His parents, who were in middling circumstances, indulged his early taste for painting, and he was placed under masters in his native place. At the age of nineteen he went to Paris, with the intention of passing on to Rome, but he was unable to accomplish his journey, probably from the want of means. He received some assistance in his studies from Fouquière, and afterwards became acquainted with Nicholas Poussin, when that great painter returned from Italy, from whose advice and society he derived great advantage. They painted in company in the Luxembourg. Upon the death of Duchesne, Champagne succeeded to his place as painter to the queen. Richelieu endeavoured to withdraw him from his royal patroness, but Champagne refused his most brilliant offers. He was indeed so scrupulous in his conduct that he never touched a brush on holidays, nor ever painted from the naked figure. He married the daughter of Duchesne, by whom he had a son. He was received into the academy upon its first formation in 1646, and was subsequently its rector. He died in 1674.

Champagne laboured with extreme assiduity, and acquired great facility. His drawing is minutely correct, and his colour pleasing; but his design and effect are tame. His portraits are most esteemed, particularly one of Richelieu. His principal works are at Paris, where he spent nearly the whole of his life.

CHAMPOLLION, JEAN-JACQUES, commonly named **CHAMPOLLION-FIGEAC**, to distinguish him from his younger brother, Champollion-le-Jeune, was born in 1778 at Figeac, in the French department of Lot. He at first held an office in the library of Grenoble, capital of the department of Isère, and was afterwards professor of Greek literature in that city. In 1828 he was appointed keeper of the manuscripts in the Royal Library of Paris, an office which he held till 1848. In 1849 he became keeper of the library of the palace of Fontainebleau, and is now (1856) librarian to the Emperor Napoleon III. His first publication was a 'Lettre à M. Fourier sur l'Inscription Grecque du Temple de Denderah en Egypte,' 8vo, Grenoble, 1806, which was followed in 1807 by his 'Antiquités de Grenoble, ou Histoire Ancienne de cette Ville, d'après ses Monuments,' 4to, Grenoble; and in 1809 by 'Nouvelles Recherches sur les Patois, ou Idiomes Vulgaires de la France,' 8vo. His 'Annales des Lagides, ou Chronologie des Rois Grecs d'Egypte, successeurs d'Alexandre le Grand,' 2 vols. 8vo, Paris, 1819, received the prize of the Académie des Inscriptions. He also republished several charters and other documents appertaining to the history of France in the middle ages. The original manuscripts are preserved in the Royal Library of Paris, and some of them date as far back as the 6th century. One of the most expensive of his publications was 'Les Tournois du Roi René, d'après les Manuscrits et les Dessins Originaux de la Bibliothèque Royale,' folio, 1827-28. In these 'Tournaments of King René,' of which only 200 copies were printed, he was assisted by M. Motte, the lithographer. In 1842 he published a 'Notice sur les Manuscrits Autographes de Champollion-le-Jeune, perdus en l'année 1832, et retrouvés en 1840.' He published in the following year an elementary treatise on Archaeology, and another on Chronology. He was a contributor to several works published periodically, such as the 'Dictionnaire de la Conversation,' the 'Magazin Encyclopédique,' the 'Revue Encyclopédique,' the 'Bulletin des Sciences Historiques,' and the literary portion of the 'Moniteur.' He also assisted in the preparation and issuing of the 'Documents Historiques' published by the French government, to which he contributed 6 vols. 4to. After the death of Champollion-le-Jeune he published some of the materials on Egypt, Hieroglyphics, &c., on which his brother had been employed immediately before his death. (*Nouvelle Biographie Générale*.)

CHAMPOLLION, JEAN FRANÇOIS LE-JEUNE, so called to distinguish him from his elder brother, Champollion-Figeac, was born at Figeac, in the department of Lot, December 23, 1790. He studied in the Lycée of Grenoble, and afterwards went to Paris in 1807, where he applied himself to the oriental languages under Langlès and De Sacy, but more especially to the study of the Coptic, and to Egyptian archaeology in general. In 1811 he was appointed professor of history in the Lycée of Grenoble, and librarian of the public library. In 1814 he published his first work, 'L'Egypte sous les Pharaons,' 2 vols. 8vo, which is a geographical description of that country under its ancient kings, with a view to fix its divisions, the sites and names of its towns, &c. The work is accompanied by a map. In the preface, alluding to the hieroglyphics on the Egyptian monuments, he says "that it was to be hoped that from these monuments, on which ancient Egypt painted more material objects, we should be able at last to discover the sounds of its language, and the expression of its thought." In 1821 he published at Grenoble a little work, 'De l'Écriture Hiéroglyphique des Anciens Égyptiens,' in which he stated his opinion "that the hieratic characters were merely a modification of the hieroglyphic symbols, which were adopted for the sake of brevity, and as a sort of hieroglyphic short-hand, and were not alphabetical characters as it had been supposed by some; the hieratic characters, as well as the hieroglyphic from which they are derived, being expressive of objects and not of sounds."

In the year following appeared Champollion's letter to M. Daquier,

the secretary of the Academy of Inscriptions and Belles-Lettres. "relative à l'alphabet des hiéroglyphes phonétiques employé par les Égyptiens pour inscrire sur leurs monuments les titres, les noms, et les attributions des souverains Grecs et Romains," Paris, 1822. In this letter he retracted what he had formerly asserted, in so far that he now demonstrated what Dr. Young had already stated in November 1819, in the supplement to the 'Encyclopædia Britannica,' article 'Egypt,' namely, that the Egyptians used occasionally hieroglyphic signs as alphabetical characters on their monuments, to express the names of foreign sovereigns, Greek and Roman, who ruled over their country. In the introduction to his next work, 'Précis du Système Hiéroglyphique, etc.,' Champollion observes, and his friend Rosellini confirms it in his biography, that he came to the same conclusion as Dr. Young contemporaneously with the latter, and by his own investigation; but this assertion, especially with regard to contemporaneity, is at variance with the statements of the Grenoble work already mentioned, which was published as late as 1821, nearly two years after the publication of Dr. Young's discovery. However this may be, Champollion at least improved upon Dr. Young's hint, and deduced a phonetic alphabet, applicable not only to the names and titles of foreign sovereigns, but also to those of the native sovereigns and of the divinities of ancient Egypt. By comparing Champollion's alphabet with Dr. Young's, the difference between the two is apparent. Champollion used the word phonetic to express characters denoting sounds, a term which had been used long before him by Zœga in the same sense in his work on 'Obelisks.' In his 'Précis du Système Hiéroglyphique des Anciens Égyptiens, ou Recherches sur les Éléments premiers de cette Écriture Sacrée, sur leurs diverses combinaisons et sur les rapports de ce Système avec les autres Méthodes Graphiques Égyptiennes,' Paris, 1824, he asserted, 1, "that his phonetic alphabet is applicable to all the royal names of the most ancient epochs; 2, that the ancient Egyptians employed at all epochs phonetic hieroglyphics to represent alphabetically the sounds of their spoken language; 3, that all hieroglyphic inscriptions are in a great measure composed of signs purely alphabetical, and such as are determined in his phonetic alphabet." It seems almost superfluous to remark that the two last positions are mere assertions, unsupported by proof, as any one who will take the pains to examine attentively Champollion's works will easily see. Klaproth, in his 'Observations Critiques sur l'Alphabet Hiéroglyphique découvert par M. Champollion-le-Jeune,' which precedes his 'Collection d'Antiquités Égyptiennes,' Paris, 1829, has in our opinion completely demolished Champollion's general theory, and reduced his discovery to its proper limits. Klaproth concludes his critical observations with the following corollaries:—1. "That Champollion appears to have had no fixed basis for his system, as he has repeatedly altered the meaning of his characters, both phonetic and symbolic, as appears from comparing the alphabet of the second edition of his 'Précis,' 1827, with that of the first. 2. That although he has explained proper names and some particles of speech, yet he has never been able to read satisfactorily one connected sentence of hieroglyphic writing, nor three or four consecutive words of the demotic characters of the Rosetta stone. 3. That he assumes against all probability that the Coptic language, which is a mixed dialect, and known to us in a very imperfect state, is the language that was spoken by the Egyptians under the Pharaohs; its sounds, according to him, being represented by the phonetic signs. 4. That it appears that the names of the kings, and the ordinary epithets attached to them, are written alphabetically in the cartouches or frames; but that besides these every king has another title of honour, or prenomen, which fills up another cartouche, and which seems composed partly of alphabetic and partly of symbolic characters, which last have hitherto been only explained by conjecture." Besides these and other general arguments against Champollion's system, for which we refer to Klaproth's work, Klaproth charges Champollion with having completely altered several cartouches of the table of Abydos to make them suit his hypothesis. And further, he does not forget to remind us that Champollion, while passing through Aix on his way to Egypt in 1828, saw a fine papyrus belonging to Mr. Sallier, written in demotic characters, which he gravely pronounced to be "a history of the campaigns of Sesostris Ramses, written in the ninth year of that monarch's reign by his bard and friend." This assertion was published as a great discovery by the Academy of Sciences of Aix, and the report was inserted in Ferussac's 'Bulletin Universel.'

During Champollion's visit to Turin in 1824, to examine the Egyptian Museum of that city, he wrote two letters to the Duke of Blacas d'Aulps, who had become his patron at the French court. In these letters he explains the names and titles of many of the Pharaohs written upon the monuments in the Turin collection, and he undertakes to class them into dynasties, with the assistance of Manetho. ('Lettres à M. le Duc de Blacas d'Aulps, relatives au Musée Royal Égyptien de Turin,' Paris, 1824-25.) His work on the Egyptian gods came out in parts, but has never been completed—'Pantheon Égyptien, ou Collection des Personnages Mythologiques de l'ancienne Égypte, d'après les Monuments, avec un texte explicatif.' Charles X. having determined to purchase a valuable collection of Egyptian antiquities, just arrived at Leghorn, for the museum at Paris, Champollion was appointed, through the Duke of Blacas, to proceed to Italy for the purpose of examining and valuing them. From Leghorn he

proceeded to Rome and Naples, in the company of Rosellini. On his return to Paris he was named Director of the Egyptian Museum at the Louvre, of which he published a description—'Notice descriptive des Monuments Egyptiens du Musée Charles X.,' 1827. In 1828 the King of France appointed a scientific expedition to proceed to Egypt, in order to examine the monuments of that country, under Champollion's direction. At the same time the Grand-Duke of Tuscany, Leopold II., appointed a similar expedition for the same object, at the head of which he placed Rosellini, Champollion's friend. The two expeditions, consisting of six Frenchmen and six Tuscans, sailed together from Toulon, and arrived at Alexandria in August 1828. Champollion remained in Egypt till the end of 1829, during which time he wrote the letters which are published under the title of 'Lettres écrites d'Égypte et de Nubie en 1828-9,' 8vo, Paris, 1833. On his return to France, in 1830, he was made a member of the Institute, and subsequently appointed, by Louis Philippe, Professor of Egyptian Antiquities in the College of France. It was agreed between the French and Tuscan governments that the result of the observations of the two expeditions should be published together in one work, in French and Italian, under the direction of Champollion and Rosellini, 'Monuments de l'Égypte et de la Nubie, considérés par rapport à l'Histoire, la Religion, et les Usages Civils et Domestiques de l'Antienne Égypte,' &c. The work began to appear in parts in 1832. In the letter-press accompanying this publication, Rosellini has not only adopted the general system of Champollion, but has carried it much farther than his friend. A sharp criticism upon it by Cataldo Jannelli was published in No. 19 of the 'Progresso,' a Neapolitan journal, Naples, 1835. While Champollion was preparing the first part of the new work for the press, he was attacked by a paralytic fit, and died at Paris on the 5th of March 1832.

Champollion's merits as a laborious student of Egyptian archaeology are undeniable; but his judgment seems not to have been sound, his deductions from his premises not always correct, and his learning (except on Egyptian antiquities) neither extensive nor exact. He corrected Dr. Young's first crude notions as to the phonetic symbols, and considerably extended the number of known signs; and this may perhaps lead to further results. Had he lived longer he might have modified some of his former assertions, and entered perhaps upon a safer path of investigation. For the controversy concerning the general application of the phonetic alphabet, see vol. II. of the 'Egyptian Antiquities' of the British Museum, published in the 'Library of Entertaining Knowledge,' ch. x., on the 'Rosetta Stone,' where the subject is fully investigated. See also Professor Kosegarten, 'De prisca Ægyptiorum Literatura Commentatio,' 4to, 1828; Greppo's 'Essay on the Hieroglyphic System of Champollion,' translated by Stuart, Boston, 1830. Rosellini wrote a biographical notice of Champollion in the Florence 'Antologia' for April 1832. Champollion made a Coptic Grammar and Dictionary, which remained unpublished at his death, but which was surreptitiously published at Rome in 1842. The manuscripts of Champollion were purchased by the French government in 1833, with a view to their publication. The editing of them was confided to M. Champollion Figeac, and they appeared in 1834-48. A monument was erected by the town-council to the memory of Champollion in the principal place of his native town. His bust was placed in the Museum of Versailles by order of Louis Philippe, and copies of it were made by order of the Minister of the Interior for the town of Figeac, the Museum of Grenoble, and the library of the Institute.

CHANDLER, DR. RICHARD, was born at Elson in Hampshire, in 1738, studied at Winchester School, and afterwards entered Queen's College, Oxford, in May 1755. Soon after taking his Bachelor's degree (in 1759) he published 'Elegiaca Græca,' containing the fragments of Tyrteus, Simonides, Meleager, Alceus, &c., with notes. In 1763 he edited the splendid work 'Marmora Oxoniensia.' In 1764 he was sent by the Dilettanti Society to travel into Asia Minor and Greece, in company with Revett the architect and Pars the painter. They spent more than a year in Asia Minor; and in 1765 they proceeded to Athens, and passed another year in examining Attica and the Peloponnese. They returned to England in November 1766. The result of their labours, the 'Ionian Antiquities, or Ruins of Magnificent and Famous Buildings in Ionia,' 2 vols. folio, was published in London in 1769. In 1774 Chandler published 'Inscriptiones Antiquæ pleraque nondum editæ in Asia Minori et Græcia, præsertim Athenis collectæ,' fol., Oxford. His 'Travels in Asia Minor,' 4to, 1775, and 'Travels in Greece,' 4to, 1776, still rank among the best descriptions of those countries. There is a French translation (Paris, 1806) of the 'Travels in Asia Minor and in Greece,' with notes, by J. P. Servois and Barbis du Bocage. These two works have been since republished together, by the Rev. R. Churton, with Revett's remarks, and a biography of Dr. Chandler, 2 vols. 8vo, 1835. In 1773 Chandler took the degree of D.D.; and in 1779 he obtained the living of East Witleham and West Tisted, Hants. In 1785 he married, and afterwards travelled in Switzerland and Italy. In 1800 he was made rector of Tylehurst in Berkshire, when he published his 'History of Ilium, or Troy, including the adjacent country and the opposite coast of the Chersonesus,' 4to, London, 1802, in which he refuted Bryant's assertion "that the Trojan war was a fiction, and that no such city as Troy in Phrygia ever existed;" and he vindicated the veracity of Homer, and especially the truth of his local descriptions. Dr. Chandler died in

February 1810, in his seventy-second year. He left in manuscript, 'The Life of William Waynflete, Bishop of Winchester, Lord High Chancellor of England in the reign of Henry VI., and Founder of Magdalen College,' which was published in 8vo, London, 1811.

* CHANGARNIER, NICOLAS-ANNE-THÉODULE, the recent confidant, and to some extent the rival of Louis Napoleon, was born at Autun, on the 26th of April 1793. In early life, he was a strong partisan of the legitimist cause, having served in the king's body-guard, which he entered as a private, January 10, 1815. In 1821 he was transferred to the 60th regiment of the line, and accompanied the Duke of Angoulême to Spain two years afterwards. Already, in that campaign, the brilliant courage and the capacity of the young soldier drew attention upon him.

After the revolution of July in 1830, he went as captain of the 2nd Léger to Algeria; where his great activity and constant success, caused him to be sent on many perilous expeditions, in all of which his genius for war gave so much tone and dignity to his enterprises, that he was in reality the general, and his small troop an army. He soon became a chef-de-bataillon, and the first unsuccessful attempt upon Constantine, which overshadowed the fame of his brother officers, gave new life to that of Changarnier. Having reached Mansourah (November 24, 1836), at the moment when the 59th and 63rd were in full retreat, Changarnier, with his battalion, reduced to 300 men, took up the ground between the rest of his army and the main body of the enemy. Halting his men, and forming them into a square, he said to them: "Come, lads, let us look those fellows in the face; they are 6000, we are 300, so the game is equal." Inspired by the cool decision of their leader, his brave followers met the enemy with intrepid firmness, and drove them back with considerable slaughter. During the conflict a ball reached him in the middle of his square. He was made lieutenant-colonel of the 10th line for his conduct in this affair; then a colonel in 1838.

Constantly in the field, his history and that of the French war in Algeria are one. On the 4th of April 1841, when Medeyah was provisioned, General Changarnier's brigade was fiercely attacked in the Bois des Oliviers, both in flank and rear, by the cavalry and regular battalions of Abd-el-Kader. Struck on the shoulder, and supposed to be mortally wounded, he refused to quit the field; but alighting a moment, had the ball extracted, again led his column, and cut his way into the town. In November of the same year, he cleared the country about Boufarick of several wild tribes, taking many prisoners, and an immense herd of cattle.

His famous expedition in the mountains of Ouarencenes, in company with the Duke of Aumale, largely contributed to the establishment of the French supremacy in Algeria. On the 9th of April 1843 he received the appointment of lieutenant-general. He was sent on almost every expedition, and took part in almost every engagement. Clausel, Vallée, Bugeaud, and the Orléans' princes, spoke of him in the same terms of admiration. His own character lent a greatness to occasions which in themselves were small.

In 1843 he drew a circle round the country of the Beni-Menacer, where the Emir was once more raising the spirit of revolt, and subdued those warlike mountaineers. With this operation the long series of his exploits in Africa came to a close; and the general returned to France, after a most arduous service of thirteen years. In the month of September 1847, the Duke of Aumale having succeeded Marshal Bugeaud in the government of Algeria, became anxious to avail himself of the talents of his former comrade, and induced him to accept the command of the army in Algiers. The events which followed in February 1848 removed the prince from that province, but before he left the country he committed the charge of government, provisionally, to the general. On the arrival of General Cavaignac soon after, Changarnier delivered to the army an able address on the value and duty of obedience to the state, and returned to France.

He was now one of the Triumvirate of great names in France, and in May 1848 was appointed governor-general of Algeria, in the room of Cavaignac, whose presence had been deemed indispensable in the capital. On the 13th of June 1849, it was his good fortune to suppress, or rather to prevent, an insurrection in Paris by the strength and rapidity of his preparations. On the election of the president of the French republic, Changarnier was appointed Commander of the First Military Division, and all the military power of the metropolis centred in his hands. But this power, and the prestige of his military fame, gave umbrage to Louis Napoleon, who abolished his command, and reduced him to the state of a private citizen. On the 2nd of December 1851 he was arrested, and exiled soon after. He has since resided chiefly at Brussels.

(*Dictionnaire de Conversation; History of General Changarnier, by Fr***; Corkran, History of the National Assembly.*)

CHANNING, WILLIAM ELLERY, D.D., was the son of an eminent merchant of Newport, Rhode Island, United States, where he was born on the 12th of April, 1780. He was educated at Harvard College, and his first views are said to have been directed to the medical profession; but he was eventually induced by the lectures or advice of the Hollis professor of divinity to enter the ministry in the Unitarian communion, which however was not then distinguished in the United States from what is commonly called orthodox Christianity by

no clear line as now. He took his degree in 1796, and soon after went to Virginia, and spent some time there as a teacher; but in 1803 he was appointed to the office in which he remained for the rest of his life—that of pastor of the Federal-street congregation in Boston. At this time he was considered to lean to what are called evangelical views; and several of the neighbouring clergymen of other persuasions used occasionally to preach from his pulpit. His own preaching early drew attention by its superior polish and eloquence; but not, it would appear, to any remarkable degree till he had officiated for some years, when his theology assumed a more decided character, and his congregation, having considerably increased, built him a larger church, and in 1814 gave him a colleague, the Rev. Mr. Gannett. What first brought him into general notice in his own country were several sermons which he published during the war of 1812. These were followed by a number of papers in the 'Christian Disciple,' the 'Christian Examiner,' and perhaps other Boston reviews or magazines. In England however Dr. Channing's name was not much heard of till after the appearance of his 'Remarks on the Character and Writings of John Milton,' originally published in the form of a review of the 'Treatise of Christian Doctrine' in the 'Christian Examiner' for 1826. In the same publication for 1829 appeared his 'Remarks on the Life and Character of Napoleon Bonaparte,' as a review of Scott's 'Life of Napoleon.' In 1830 a collection of Channing's writings was published in a royal 8vo volume at Boston, under the title of 'Reviews, Discourses, and Miscellaneous.' He continued to produce occasional tracts, discourses, and other writings during the remainder of his life, of which several subsequent collections were formed, both in America and in England; but the most complete we believe is that published at Glasgow in 6 vols. 8vo, of which the first five were brought out in 1840, with the sanction and assistance of Dr. Channing himself, and the sixth in 1844 under the authority of his son, Mr. W. F. Channing. The subjects principally treated of, besides those already mentioned, are war, temperance, public education, the church, and especially the abolition of negro slavery, of which measure Channing was one of the warmest advocates. His death took place at Burlington, Vermont, on the 2nd of October 1842.

Channing is one of the most striking writers America has produced; and his works, besides their attractions of style, are all animated by a pure and lofty moral spirit. His eloquence however, though often imposing, has not much nature or real fire; its splendour is mostly verbal; the thoughts are true and just, rather than new or profound; it is exciting on a first perusal, but will hardly bear a second. Nothing that he has written therefore has much chance of long retaining its reputation; there is too little in it of the spirit of life; too little of anything that can be called its own, and that is not to be found elsewhere. Both in its rhetorical character however and in its strain of sentiment it was well calculated to produce an immediate effect.

CHANTREY, SIR FRANCIS, was born on the 7th of April 1782, at Norton, in Derbyshire, where his father was a farmer. Chantrey's father wished to make an attorney of him, but he preferred being an artist, and his predilection was for carving. He was accordingly bound for three years to a carver at Sheffield; but during the time of his apprenticeship he found that it was a style of work which afforded little scope for his true love for art, and he therefore turned his attention to modelling in clay. He tried his fortune as a modeller, first in London, then in Edinburgh, and lastly in London. In London, Nollekens was greatly instrumental in promoting Chantrey's fortunes. The young sculptor (he was then four-and-twenty) sent a bust of J. R. Smith to the exhibition of the Royal Academy, which, in the disposition of the works for exhibition, attracted the admiration of Nollekens, who said: "It is a splendid work; let the man be known: remove one of my busts, and put this in its place." Nollekens himself did all that was in his power to make him known; but Chantrey, having once found the opportunity of making himself known, required thenceforth no other recommendation than his busts to ensure himself full employment in that department of art. In 1816 he was chosen an Associate, and in 1818 a Member, of the Royal Academy. In the following year (1819) he paid his first visit to Italy, where he was elected a member of the academies of Rome and Florence.

In the career of a uniformly successful artist there are few incidents to record: Chantrey's career for the last twenty years of his life, as a monumental sculptor, was unrivalled; beyond this sphere however he did not range. He was knighted by the queen in 1837, at which period he was already a sufferer from disease of the heart, and from this time he finished few works himself: their completion was entrusted to his able assistant Mr. Weekes. Of his poetic works, which are not many, few were executed from his own designs: the statue of Lady Louisa Russell, daughter of the late Duke of Bedford, at Woburn Abbey, and the 'Sleeping Children,' in the cathedral of Lichfield, his best sepulchral monument, were both executed from the designs of Stothard: the first is a child on tiptoe, pressing a dove to her bosom; the second is a monument to two children of the late W. Robinson, Esq. There are also in Woburn Abbey two reliefs from Homer by Chantrey—the 'Parting of Hector and Andromache,' and 'Penelope with the bow of Ulysses'; but they are calculated rather to detract from his reputation, or, in other words, are evidence that poetic art was beyond his sphere. They are engraved in plates xxix. and xxx. of the 'Outline Engravings and Descriptions of the Woburn Abbey Marbles.'

As a monumental sculptor Chantrey will rank high: some of his statues in this branch of art are among the finest specimens of their class. One of his best works is the bronze statue of William Pitt, in Hanover-square, London. There are also marble statues by him, in Westminster Abbey, of Francis Horner, Sir T. S. Raffles, George Canning, Rev. E. F. Sutton, and Sir John Malcolm. Among his principal works are also statues of Washington, in the state-house at Boston, United States; Spencer Percival, in All Saints' Church, Northampton; James Watt, in the church of Aston, near Birmingham; Sir Edward Hyde East and Bishop Heber, at Calcutta; Canning, in the town-hall of Liverpool; Mountstewart Elphinstone and Sir Charles Forbes, at Bombay; Dr. Ryder, bishop of Lichfield and Coventry, in Lichfield Cathedral; and Dr. Bathurst, bishop of Norwich, in Norwich Cathedral. His busts are extremely numerous; his sitters were a large proportion of the persons of rank and distinction of his time. He executed also a few equestrian statues in bronze, but their postures are formal and want vigour; the horses are particularly inanimate in the body and limbs. His last work of this class, the Wellington testimonial, now placed before the Royal Exchange, London, was executed nearly entirely by Mr. Weekes.

Though deservedly eminent in his style, and certainly one of the best sculptors of his time, Chantrey cannot be reckoned among great sculptors: his busts display no extraordinary powers of conception or of modelling, and the best of his statues are but simple draped figures in repose, well-proportioned, and with much characteristic expression; but they are not superior to similar works by many sculptors of less renown. In the treatment of his portraits however he always disposed the unpicturesque costume of the present day with the greatest judgment and with the least possible injury to the proportions of the human figure; he never left them stiff or stony, as they are on many of the statues in St. Paul's Cathedral, executed by some of Chantrey's contemporaries and immediate predecessors.

Chantrey had no children or very near relations, and he left the reversion of a portion of his property, at the death or second marriage of his wife, at the disposal, under certain restrictions, of the president and council of the Royal Academy of Arts in London, for the promotion of British Fine Art in painting and sculpture, including an annuity of 300*l.* for the president and 50*l.* for the secretary, payable on the 1st of January in every year. The interest of the residue is to be laid out in the purchase of works of Fine Art of the highest merit in painting and sculpture that can be obtained, either already executed or which may hereafter be executed by artists of any nation, provided such artists shall have actually resided in Great Britain during the executing and completing of such works; it being his express direction that no work of art shall be purchased unless it shall have been executed within the shores of Great Britain: and further, that in making such purchases, the works of the highest merit shall be chosen, solely with regard to their intrinsic merit, and a liberal price be paid, wholly at the discretion of the president and council of the Royal Academy. The president and council however will not be obliged to lay out annually the whole or any part of the annual sum at their disposal, which may be allowed to accumulate for not more than five years. All purchases must be bona fide purchases of finished works. The will expressly provides against commissioning any artist to execute works; and all purchases must be publicly exhibited for at least one month at the annual exhibition of the Royal Academy or elsewhere.

All these purchases are to be collected for the purpose of forming and establishing a "Public National Collection of British Fine Art in Painting and Sculpture," executed within the shores of Great Britain. The will provides also against any expenditure of these funds in the erection of a building to contain permanently the works thus purchased; it having been Chantrey's expectation that such building would be provided by the nation free of all charge upon his estate. The property devoted by Sir Francis Chantrey to this purpose is his residuary personal estate, over and above the property bequeathed to his wife, and all legacies; but he expresses a wish that at the decease of his wife all the property bequeathed to her should be by her devoted to the same purpose. Lady Chantrey however, so long as she remains a widow, has a life-interest in this residuary personal estate: its amount is not publicly known, but it is said to be about 2500*l.* per annum; it is vested in five trustees, including the president and treasurer of the Royal Academy. Chantrey left to his friend and principal assistant Allan Cunningham 2000*l.*, and, in a codicil, a life-annuity of 100*l.*, and, in case of his death, to his widow. He left also to his assistant Henry Weekes, 1000*l.*; provided in both cases that they continued in their offices as assistants, until the completion of his unfinished works, or such as it was necessary to finish. Allan Cunningham however did not survive Chantrey an entire year: Chantrey died on the 25th of November 1841; Cunningham died on the 5th of November 1842.

Chantrey was buried in a vault constructed by himself in the church of his native place, Norton in Derbyshire, and he bequeathed 200*l.* per annum to the clergyman of the place, so long as his tomb shall last, to instruct ten poor boys, and to pay annually 10*l.* to five poor men, and to five poor widows or unmarried women, selected by the clergyman, and being of the parish of Norton; the residue to be reserved by the clergyman for his own use in consideration of his trouble.

Lady Chantrey presented the original models of the entire series of Sir Francis Chantrey's busts, the greater part of his monumental figures, and his studies from the antique, to Oxford University, "on condition that a permanent place be assigned to them in the Western Sculpture Gallery" of the Taylor Buildings, where they now are, and form a singularly interesting, and in some respects unique, series of the portraits of many of the most eminent among Chantrey's contemporaries.

CHAPMAN, GEORGE, the earliest English translator of Homer, and known also as a prolific writer of dramas, was born in the year 1557. His birth-place is uncertain. Some have supposed him to have been a native of Hertfordshire, in which county, at Hitching-hill, he is known to have for some time resided. Wood believes him to have been of a Kentish family. The same writer asserts that he studied at Oxford, and that, although eminent in classics, he neglected philosophy, a fact which has been referred to as accounting for his want of an academic degree. Coming to London, he entered the ranks of the professional authors, and became an esteemed member of the best literary society, associating with Spenser, with Daniel, and with Shakspeare, who was six or seven years his junior. He was patronised by Sir Thomas Walsingham and his son, by Henry Prince of Wales, and by Somerset the royal favourite. The death of the prince, and the fall of the minion, may be supposed to have had an unfavourable influence on his position; and even before these events Chapman, with Ben Jonson and Marston, had narrowly escaped severe punishment for satirical reflections on the Scotch, contained in their comedy of 'Eastward Ho!' But, although the particulars of Chapman's history are little known, it is understood that he held some place about court; and there is no evidence of his having ever laboured under those pecuniary distresses which mark so painfully the biography of some of his literary contemporaries. His personal character appears to have been both respectable and amiable. Jonson declared to Drummond that he loved Chapman; and Anthony Wood asserts him to have been "a person of most reverend aspect, religious and temperate, qualities rarely meeting in a poet." He attained to a ripe old age, and died in London on the 12th of May 1634. He was buried in the church-yard of St. Giles-in-the-fields, where his friend Inigo Jones erected a monument to his memory.

Chapman's published writings are very numerous. Among his non-dramatic productions, the most valuable, as well as ambitious, was his famous translation of Homer into English fourteen-syllable verse. Seven books of his 'Iliad' appeared in 1598; twelve books appeared in folio about 1600; and, after the accession of King James in 1603, there was published in folio the complete translation: 'The Iliads of Homer, Prince of Poets, never before in any language truly translated, with a comment upon some of his chief places, done according to the Greek by George Chapman.' This work was reprinted, with introduction and notes by Dr. W. Cooke Taylor, London, 1843, 2 vols. 12mo. The 'Odyssey,' similarly translated, appeared in 1614, and was followed in the same year by the 'Battle of the Frogs and Mice,' and the Homeric Hymns and Epigrams. The following were Chapman's other non-dramatic works, original and translated:—1, 'The Shadow of Night, containing two Poetical Hymnes,' 1594, 4to. 2, 'Ovid's Banquet of Seneca,' 1595, 4to. 3, 'Hero and Leander, begun by Ch. Marlow, and finished by George Chapman,' 1606, 4to. 4, 'Euthymia Raptus, or the Tears of Peace,' 1609, 4to. 5, 'An Epicede, or Funeral Song, on the most disastrous Death of the Highborn Prince of Men, Henry Prince of Wales,' 1612, 4to. 6, 'Andromeda Liberata, or the Nuptials of Perseus and Andromeda,' 1614, 4to. 7, 'The Georgicks of Hesiod, by George Chapman, translated elaborately out of the Greek,' 1618, 4to. 8, 'Pro Vere Autumni Lacrymæ, to the Memorie of Sir Horatio Vere,' 1622, 4to. 9, 'A Justification of a strange action of Nero, &c.; also a Just Reproof of a Roman Smell-Feast, being the Fifth Satyre of Juvenal,' 1629, 4to.

The following are the titles of Chapman's plays, with the dates of their printing:—1, 'The Blind Beggar of Alexandria,' a comedy, 1598. 2, 'An Humorous Day's Mirth,' a comedy, 1599. 3, 'All Fools,' a comedy; and 4, 'Eastward Ho,' a comedy, 1605 (by Chapman, Jonson, and Marston); both reprinted in Dodsley's collection. 5, 'The Gentleman Usher,' a comedy, 1606; 6, 'Monsieur d'Olive,' a comedy, 1606; and 7, 'Bussy d'Ambois,' a tragedy, 1607; all three reprinted in Dilke's 'Old English Plays.' 8, 'Cæsar and Pompey,' a tragedy, 1607. 9, and 10, 'The Conspiracy and Tragedy of Byron,' two tragedies, 1608. 11, 'May Day,' a comedy, 1611; reprinted in Dilke's collection. 12, 'The Widow's Tears,' a comedy, 1612; reprinted in Dodsley's collection. 13, 'The Revenge of Bussey d'Ambois,' a tragedy, 1613, in Dilke's collection. 14, 'The Masque of the Inns of Court,' 1613. 15, 'Two Wise Men and all the rest Fools,' a comedy, 1619. 16, 'The Tragedy of Alphonsus, Emperor of Germany,' 1654. 17, 'Revenge for Honour,' a tragedy, 1654. 18 and 19, 'The Ball,' a comedy, and 'Chabot, Admiral of France,' a tragedy, both printed in 1639 as works of Chapman and Shirley, and reprinted in the modern edition of Shirley's works by Gifford, who pronounces Chapman to have plainly had the principal share in their composition. Among the many speculations as to the authorship of the drama called 'The Two Noble Kinsmen,' in which Shakspeare has been asserted to have assisted Fletcher, Mr. Knight, in his editions of the great poet's works, has conjectured that the parts attributed to him may really have been composed by Chapman.

Chapman's dramas, although works of much significance in the history of our old literature, are not the most valuable of his works. They are among the many productions of his time which were written by men tempted, through the fashion of the day, into a walk of composition for which they were but indifferently qualified. In comedy, which had been formed into a native school more completely than tragedy, Chapman adapts himself readily, and not without success, to the teaching of his juniors, especially Jonson and Fletcher; while he gives to the tone of his works not unfrequently an elevation of thought and a fulness of descriptive imagery which make some amends for the pervading stiffness of his portraiture of character and the forced and artificial turn of his incidents. In his tragic dramas he is, in point of plan and form, a semi-classic. He attempts at once to gratify the taste of his age and nation for the direct and vivid representation of dramatic horrors, and to maintain that tone of narrative declamation and of didactic reflection which Seneca had taught him, and to which his cast of mind made him naturally prone. The latter part of his 'Byron' is, as we venture to think, the best of his tragedies, and might better have deserved reprinting than the extravagant 'Bussy d'Ambois.' But Chapman's memory is best preserved, and his reputation as a poetical imaginer and thinker most fully vindicated, by his free translations from the Greek, and especially by his spirited and vigorous version of the Iliad. The republication of this fine old poem is a judicious tribute to the improved taste of our time in poetical literature. His Iliad, like his plays, is deformed by many faults. It is as unequal as careless. Indeed, he himself, on completing the work, re-wrote the first book entirely, and altered very much the other eleven that had previously been published. But his patience was not sufficient, either for correcting adequately what he had already written, or for carrying him carefully through the remainder of his task: the last twelve books were translated by him in less than fifteen weeks. And again, indolence and strong imagination concurred in tempting him to desert, in many places, the sense of his author, and to paint elaborately pictures for which Homer hardly gave him even the sketch. Yet for vigour of fancy, for a loose kind of faithfulness to the spirit of the original, for constant strength and frequent felicity of diction, the work is one of the finest poems which our language possesses. When Pope, who carefully read it, described it as a work which Homer might have written before arriving at years of discretion, his fastidious taste led him to do the old poet less justice than that which had been rendered by Waller, who confessed that he could never read Chapman's Iliad without a degree of rapture.

CHAPPE, CLAUDE, a French mechanician, who, though not the original inventor of a machine for transmitting intelligence with rapidity between places very distant from each other, must be considered as having devised the means of rendering such a machine available for that purpose. He was a nephew of the Abbé Chappe d'Auteroche, and was born at Brulon in Normandy, in 1768. It is said by his French biographers that, happening on some occasion in his youth to be separated from his friends, he conceived the idea of corresponding with them by means of signals; and that the result of his efforts to obtain this end was the invention of the machine which he called a telegraph (*τῆλε* and *γράφω*), or a semaphore (*σῆμα* and *σῆμα*). Whether or not he had at that time any knowledge of the discoveries of Dr. Hook in England, or of Amontons in his own country, both of which were nearly a century earlier, is uncertain, but there appears to be some resemblance between his machine and that which was proposed by the former in his discourse to the Royal Society in 1684. Be that as it may, no doubt can exist that M. Chappe is justly entitled to the honour of having invented both a particular system of signals, and the mechanism by which the operations are performed.

This machine consisted of a vertical pillar of wood fifteen or sixteen feet high, at the top of which was a transverse beam eleven or twelve feet long, which turned on a joint at its centre, and was capable of being placed at any angle with the pillar; and at each extremity of the beam was a secondary arm, which also turned on a joint, and could be placed either in the same direction as the beam or at any angle with it, upwards or downwards. The various positions of the beam and secondary arms were to serve as indications of the letters of the alphabet, and of the ten numerals; the sentence to be transmitted was to be exhibited letter by letter from the first telegraph to the next in the line; it was to be repeated in the same manner from the second to the third, and so on to the last.

M. Chappe presented his invention to the French Legislative Assembly in 1792, when the revolution had disposed the minds of men for the reception of any novelty which promised to be of national utility; and in the following year the government decreed that an experiment should be made, in presence of certain commissioners, in order to try its efficacy. For this purpose there was formed between Paris and Lisle, at distances from each other equal to three or four leagues, a line of stations, at each of which one of the machines was constructed; and the first, which was immediately under the direction of the inventor, was placed on the roof of the Louvre. The sentence to be conveyed was received there from the hands of the members composing the Committee of Public Safety, and in 13 minutes 40 seconds it was delivered through all the intermediate stations to that at Lisle, a distance of 48 leagues. The result of the experiment being con-

considered satisfactory, the use of the machine became general in France; and it is said that one of the first despatches conveyed in this manner to Paris announced the re-taking of the town of Condé.

The important advantages which might be derived from the use of the telegraph were immediately felt. A description of it was brought by an emigrant from Paris to Frankfurt-on-the-Maine, where two models were executed, which thence were sent to England by Mr. W. Playfair; and the invention, with modifications, was adopted in this country.

The claim of M. Chappe to the honour of being the inventor of this kind of machine appears to have been disputed by some of his contemporaries, who also invidiously represented its imperfections or exposed the mistakes which, as they asserted, might be made in using it; and these circumstances are said to have preyed on his mind that he fell into a profound melancholy, which terminated his life in 1805, at the age of forty-two years.

CHAPPE, D'AUTEROCHÉ, JOHN, born 1722 (1728, Delambre), died 1769, in California, whither he had gone to observe the transit of Venus. He succeeded Lacaille at the Observatory of Paris, as assistant to Cassini de Thury, and published Halley's 'Tables,' in 1754. For his travels to Siberia and to California, &c., see Delambre's 'Hist. d'Astron. XVIII. tit. 1.'

CHAPTAL, JEAN ANTOINE, a distinguished French chemist, was born in 1756, at Nizaret (Lozère). His education commenced at Mende, whence he repaired to the School of Medicine at Montpellier, and afterwards to Paris. In 1781 he was appointed to the chemical chair recently founded by the States of Languedoc. Inheriting a large fortune from his uncle, he established some important chemical manufactories in his adopted city, and thus bestowed upon France several valuable products which were previously obtained from foreigners. In 1793 Chaptal was called to the capital by the Committee of Public Safety, to manage the manufactory of saltpetre, which substances could no longer be obtained from India, and the want of which was pressing. The great establishment of Grenelle thus became the scene of that zeal and ability of which Chaptal gave so many proofs during the whole of his existence. He was one of the first professors of the Polytechnic School; and the Institute elected him a member in the place left vacant by the death of Pnyen. After the establishment of the consulate, Napoleon called him to the Council of State; and in the year 9 (1801) appointed him Minister of the Interior. Towards the end of the year 12 Chaptal retired from these high appointments. During his administration of four years he conferred many benefits upon the state. Devoting much time to the examination of charitable establishments, which had suffered from the misfortunes of the times, he liquidated their debts; and originated several new institutions for the amelioration of the condition of the poor. As might however be expected from his habits, it was to the manufacturing interests of his country that his attention was principally directed; he established chambers of commerce, and consulting councils of arts and manufactures; the School of Arts and the Conservatory, which have become an important seminary and a great museum, are monuments of his enlightened solicitude for increasing the opportunities and means of instruction. He published useful processes, visited the manufactories, conversed with the workmen, offered them his advice, applauded their discoveries, and encouraged the importation of processes and apparatus from abroad; in fact, he extended his views and his care to every substance and circumstance which he considered favourable to the improvement of manufactories. Some disappointments which he could not foresee, and certainly did not merit, obscured the close of Chaptal's brilliant career; but he supported them with dignity, without murmuring, and without breathing a complaint. He consoled himself among his friends, by study, and by fulfilling duties which had been imposed upon him, or which he had craved for himself. Too well informed not to understand the nature of his disease, and feeling his end approaching, he resigned himself like a philosopher, and making the requisite arrangements for leaving a world where he had but few days to remain, he died beloved and surrounded by his numerous family, bestowing on them his blessing as his last farewell. (Thénard.) He died at Paris, 29th July 1832, in the 76th year of his age. He was a senator under the Empire, and at the time of his death he was Peer of France and a Grand Officer of the Legion of Honour. He was one of the first founders of the Society of Encouragement, over which he presided many years.

Chaptal's principal works are 'Elémens de Chimie,' 3 vols. 8vo. The first edition appeared in 1790, and the fourth in 1803. It has been translated into most languages. 'Essai sur le Perfectionnement des Arts Chimiques en France,' 8vo, 1800; 'Art de Faire, de Gouverner, et de Perfectionner les Vins,' 1 vol. 8vo (first edition 1801, second, 1819); 'Traité théorique et pratique sur la Culture de la Vigne,' 2 vols. 8vo (first edition, 1801; second in 1811); 'Art du Teinturier et du Dégraisseur,' 8vo, 1800; 'Essai sur le Blanchiment,' 8vo, 1801; 'Chimie appliquée aux Arts,' 4 vols. 8vo, 1807; 'Art de la Teinture du Coton en Rouge,' 8vo, 1807; 'De l'Industrie Française,' 2 vols. 8vo, 1810; 'Mémoire sur le Sucre de betteraves,' 8vo (first edition, 1815; second edition, 1821); 'Chimie appliquée à l'Agriculture,' 2 vols. 8vo (first edition, 1823; second edition, 1829).

CHARDIN, SIR JOHN, was born at Paris in November 1643. His

father, who was a Huguenot, or Protestant, carried on the business of a jeweller in the French capital, and brought up his son to the same profession. As soon however as Chardin was of age, in order to gratify his taste for travelling, and "to endeavour the advancement of his fortunes and estate," he left France for the East. During his first journey, which lasted from 1664 to 1670, he visited Persia and the East Indies, and returning to Paris, he published in 12mo 'An Account of the Coronation of Solyman III., Shah of Persia.' During his residence in Persia he gained access to the court, and was appointed agent to the Shah, who commissioned him to make purchases of jewels and trinkets for him in Europe. At the end of 1671 Chardin again departed for Persia by the route of Constantinople, the Black Sea, and Armenia. He arrived at Ispahan in June 1673, and remained in Persia till 1677, "chiefly," he says, "following the court in its removals, but also making some particular journeys, as well of curiosity as business, to prosecute my intentions, studying the language, and assiduously frequenting the most eminent and most knowing men of the nation, the better to inform myself in all things that were curious and new to us in Europe." Few travellers have been so conscientious and painstaking, or have had such good opportunities of acquainting themselves with the country and the manners and customs of Persia. He spoke the language like a native, he knew Ispahan better than Paris, and he visited nearly every part of the country, traversing, he says, "the whole length and breadth thereof."

In April 1681 he came to London, where he settled as jeweller to the court and nobility. On the 24th of the same month of April 1681 he was knighted by Charles II., and on the same day married to a young lady, the daughter of a French Protestant refugee, from Rouen. In the following year he was elected Fellow of the Royal Society, which had recently been established, and some papers written by Sir John appear in the earliest number of the 'Transactions' of that society. He continued to carry on a considerable trade in jewels, prosecuting at the same time his studies of the oriental languages and antiquities. He did not publish an account of his eastern travels until 1686, and then he only brought out the first part of them, being his journey from Paris to Ispahan. ('Travels of Sir John Chardin,' fol., London, 1686.) This volume, with an unfortunate prophecy of future glory and a long reign, was rather pompously dedicated to James II., who two years later was driven from his throne. Chardin was a good courtier, but he had obligations to acknowledge to James as well as to Charles II. The latter king had employed him diplomatically on an important mission to Holland, and in 1683 Sir John had figured at the Hague and Amsterdam as agent for the English East India Company. In 1711 appeared the second part of his travels. During the latter part of his life he lived at Turnham Green, and, according to an entry in the church books, he was buried at Chiswick on the 29th of December 1713. His travels have been translated into various languages, and often reprinted. There is a very good edition (in French) in 4 vols. 4to, with plates, published at Amsterdam in 1735, which we have consulted; but the last and best edition is said to be that of Paris, 1811, in 10 vols. 8vo, with notes, by Langlès, which we have not seen.

About sixty years after his death, some manuscript notes which Chardin had written in India to illustrate passages in the Scriptures by a comparison of modern eastern usages, and which had long been lost, were recovered by his descendants, who advertised a reward for them. They were nearly all incorporated in Mr. Harmer's 'Observations on divers passages of Scripture, illustrated by books of travels,' &c.

CHARES of Mitylene, Master of the Ceremonies to Alexander the Great, made a collection of anecdotes, or perhaps rather wrote an account of the private life and adventures of the king. We may judge from the fragments in Athenæus that this work contained numerous details which were exceedingly curious and interesting, (Athenæus, 'Deipn.' Casaub., iii. 93, 124; x. 434, &c.)

CHARISIUS, AURELIUS ARCADIVS, a Roman jurist, who is supposed to have lived about the time of Constantine the Great. It is certain that he lived at least after Modestinus, whom he quotes. Modestinus lived under the emperor Alexander Severus (A.D. 222-235). Charisius was Magister Libellorum Supplicum, a keeper of petitions, as we learn from the title of an excerpt from his own writings ('Dig.' 1, tit. 11.) He wrote a work, in one book, 'De Testibus'; a work, in one book, 'De Officio Prefecto Prætorio'; and a work, in one book, 'De Muneribus Civilibus' (see 'Index Florentinus').

His writings contain some words that are perhaps not used by the earlier jurists, as 'regimenta,' 'incunctabilia' ('Dig.' 22, tit. 5, s. 21.) His style and the words that he uses clearly show him to be one of the latest of the Roman jurists. Cujacius says that Charisius was a Christian; but the proof is not given. There are a few excerpts from the three works of Charisius in the 'Digest.'

CHARITON, the author of a Greek romance, in eight books, entitled 'The Loves of Chæreas and Callirrhoe.' The writer calls himself Chariton of Aphrodisias. The time at which he lived is uncertain, but probably not earlier than the fourth century of our era. Though this, like most other Greek romances, displays little invention, it has some merit in point of style. Chariton was published by D'Orville, Amsterdam, 1750, 3 vols. 4to, with a valuable commentary. It was translated into German by Schmieder, Leipzig, 1806, 8vo, and into French by Larcher.

CHARLEMAGNE, KARL DER GROSSE, or Charles the Great, son of Pepin le Bref, king of the Franks, and of Bertha, daughter of Caribert, count of Laon, and grandson of Charles Martel, was born about 742 in the castle of Salzburg in Bavaria, a country which Pepin had conquered, as well as part of Saxony. Pepin died in 768, and Charles and Karlomann, his sons, succeeded to the vast dominions of the Franks. Charles had Austrasia and Neustria, with part of Germany; Karlomann had Burgundy and South Gaul. Karlomann died in 771, leaving two infant sons, but Charles possessed himself of his dominions; and Karlomann's widow, with her children, took refuge at the court of Desiderius, king of the Longobards. Charles was now sovereign of the whole Frankish monarchy, which extended not only over the present France, but also over nearly one-half of Germany. The Franks were still, in a great measure, a German nation; and the native language of Charles was a dialect of the Teutonic. In 772 Charles began his war against the Saxons, which continued with various interruptions till 803. Witikind, the principal chief of the Saxons, a cunning and brave barbarian, gave him full employment for many years. The Saxons were Pagans, and Charles and his Franks seem to have felt little scruple in massacring them by thousands, even after they had laid down their arms. In 774 Charles being applied to by Pope Adrian I. against Desiderius, king of the Longobards, who threatened Rome, hastened from Germany to Italy, crossed the Alps by the pass of Susa, defeated Desiderius at Pavia, and took him prisoner. He assumed the crown of Lombardy, and confirmed Pepin's donation of the Exarchate of Ravenna and the Pentapolis to the Pope, who on his part acknowledged Charles as Patrician of Rome and Suzerain of Italy, with the right of confirming the election of the popes. In 775 Charles proceeded again to Germany against the Saxons. In the following year he returned to Italy to quell some insurrections; in 778 he went to Spain against the Saracens, and conquered part of Catalonia, Aragon, and Navarre; but on recrossing the Pyrenees, his rear guard was defeated at Roncesvalles by the Vascones and the Saracens united. Several nobles of Charles's court fell on that day, among whom was Roland, warden of the borders of Brittany, 'Prefectus Britannici Limenis,' who has become the hero of many a romantic tale. In 780 Witikind having defeated several bodies of Franks, Charles found it necessary to visit Germany again in person; and after several sanguinary campaigns, Witikind was obliged to submit and receive baptism. The alternative of death or Christianity was held out to thousands of the Saxons, who generally preferred the latter; and Charles, by transplanting whole colonies of them into remote parts of France or Italy, broke their strength. Tassilo, duke of Bavaria, a feudatory of the Frankish monarchs, having assisted or connived at Witikind's incursions, Charles invaded Bavaria, and brought the duke before the diet of the great lords assembled at Ingelheim, where Tassilo was found guilty of treason and condemned to death. Charles spared his life, but had him confined in a convent in 794. As for Witikind he lived the rest of his days in peace, on his domains in the north of Germany, and his posterity is said to be perpetuated in the House of Oldenburg, the stock of the present reigning houses of Denmark and Russia.

In the year 800 Charles being victorious everywhere, and master of the best part of Europe, visited Rome, where he was solemnly crowned Emperor of the West by Pope Leo III., with the title of Carolus I. Cæsar Augustus. He was called by the historians Carolus Magnus, from which the French have made Charlemagne; German writers call him Karl der Grosse. Nicephorus I., emperor of Constantinople, sent an embassy to Charles by which he acknowledged him Emperor of the West, with the title of Augustus, defining at the same time the limits between the two empires, which seem to have been the Raab in Hungary, and the mountains of Carniola down to the Gulf of Istria; and in Italy, the old boundary between the duchy of Benevento, and the Greek possessions in Apulia and Magna Grecia. Charlemagne had therefore Germany, the Netherlands, the Gauls, the greater part of Italy and Spain as far as the Ebro, with the Balearic Islands, Corsica, and Sardinia. From the Ebro to the mouth of the Elbe, from the Atlantic to the mountains of Bohemia and the Raab, and from the British Channel to the Volturno—was the extent of his dominions. He was on good terms with the Saxon kings of Britain. The kalif of Baghdad sent embassies to him. Bohemia, which was then inhabited by Slavonian tribes, he never subjugated. About 807 or 808, the first mention occurs in history of the Normans and Danes making descents on the coast of France. Charlemagne seems to have felt the danger of this new enemy, for he took great pains to fortify the extensive coast-line of his dominions; he stationed armed vessels in every harbour, and made Boulogne one of his principal naval stations. In 813 Charlemagne named his third son Louis, called afterwards Louis le Débonnaire, his colleague in the empire. He had lost his two elder sons, Pepin and Charles; but he appointed Bernard, the son of Charles, king of Italy. In January 814, Charlemagne died of pleurisy at Aix-la Chapelle after a reign of forty-seven years. He was buried with great pomp in the cathedral at Aix-la-Chapelle.

Charlemagne may be considered the principal regenerator of Western Europe after the destruction of the Roman empire. He was ambitious, but his ambition was of an enlarged kind, and led to great and useful results. He was not merely a successful conqueror, but a statesman and a legislator; and his mind appears wonderfully enlight-

ened when contrasted with the barbarism that surrounded him. He was the first to enforce obedience and discipline among the turbulent Franks, and he effectually curbed the insubordination of his vassals, which his father Pepin had been unable to subdue. He was the founder of the Germanic empire, having transformed tribes of lawless barbarians, such as the Saxons, the Bavarians, the Frisians, &c., into a federation of civilised nations. His predecessors, Charles Martel and Pepin, had checked the advance of the Saracens on the side of the Pyrenees; Charlemagne drove them back beyond the Ebro. His overthrow of the Longobards in Italy has been viewed in various lights by party historians. He has been considered by some as having, by his alliance with the popes, favoured the encroachments of their spiritual power over temporal affairs. But it ought to be observed that in his lifetime at least he always asserted the superiority of the empire over the church in temporal matters, that he crowned himself king of Italy, and that even at Rome the laws were proclaimed in his name ('Imperante Domino nostro Carolo'), and the coin bore his stamp. Other writers have assumed that the overthrow of the Longobards was a misfortune to Italy, because they have fancied that their power was likely to effect that union of the peninsula which has been the favourite vision of the Italians in all ages. But that union, had it been possible, was more likely to be effected by a sovereign like Charlemagne, who ruled singly and firmly over his vassals, and who was acknowledged as emperor of the West and successor to the Cæsars, than by an elective king like that of the Longobards, who was every moment at variance either with some one of the numerous dukes, who ruled absolutely each his respective territory, or with the Greek emperors, who still retained nearly one-half of Italy. Besides, it ought not to be forgotten that the Longobards, even under their best kings, always retained a broad distinction between themselves the conquerors, and the Romans or conquered race. This humiliating and often oppressive distinction Charlemagne abolished, and by so doing he in fact emancipated the original Italian population from bondage. Those who may wish to look further into this often mis-stated question will find a sober and argumentative discussion of it in Manzoni's 'Discorso storico sopra alcuni punti della Storia Longobardica in Italia,' which accompanies his historical drama of 'Adelchi.' Charlemagne promoted instruction by the only means then known, by founding monasteries and endowing churches with schools attached to them. He enacted a series of regulations upon civil and ecclesiastical matters which may be considered as forming a code of laws. He often assembled diets of the great lords and bishops, and consulted them upon important matters, thus showing a deference to the opinion of the only classes that had then any pretensions to education. Upon the same principle, he favoured the clergy as being the only scholars of that age. Alouin, Paulus Diaconus, and other learned men, were honoured with his favour. He was easy of access to the humble and poor, and showed himself just and merciful towards them. He was, on the contrary, at times harsh and cruel to his enemies and to his rebellious subjects, whom he treated in the same manner that they treated their own enemies or dependents. His first wife was Hermengarda, daughter of Desiderius, king of the Longobardi, whom he repudiated after a twelvemonth, with the pope's approbation, to marry Ildegerda, a German princess, by whom he had most of his numerous children. After her death he married successively Fastrada and Luitgarda. He had also several natural children.

(Eginhard, *Vita Caroli Magni*, in Duchesne's *Rerum Francorum Scriptores*, where are also *Annales de Gestis Caroli Magni*, and *Fragmenta de Rebus Gestis Caroli Magni cum Hunis et Sclavis*, both by anonymous writers. Eginhard was a contemporary of Charlemagne, and one of his favourites. See also Struve, *Rerum Germanicarum Scriptores*, tom. i., and the other numerous French and German historians.)

CHARLES I., King of England, the third son of James I. and Anne, daughter of Frederick II., king of Denmark, was born at Dunfermline, in Fifeshire, North Britain, on the 19th of November 1600. James's second son, Robert, having died in infancy, and his eldest, Prince Henry, in his nineteenth year, in 1612, Charles became heir-apparent to the crown. He was not however created Prince of Wales till the 1st (other authorities say the 4th) of November 1616. His title before this was Duke of York and Cornwall.

Almost the only transaction in which Charles figured before he ascended the throne was the extraordinary expedition to Spain made at the suggestion and in the company of the Duke of Buckingham, in the year 1623, to conclude in person the negotiations for his marriage with the Infanta Maria, a business which had occupied his father for nearly the preceding seven years. The affair was probably prevented from being brought to the intended conclusion by this very journey. After it was broken off, Charles and his father directed their views to a French match, the negotiation for which was in progress when James died, on the 27th of March 1625. The new king's marriage with the Princess Henrietta Maria, the youngest daughter of Henri IV., was solemnised by proxy, at Paris, on the 11th of May.

At the accession of Charles, circumstances and the minds of men were ripe for a renewal of that struggle between the popular and the monarchical principles of the constitution which his predecessor had with difficulty put down, when it broke out in the parliament assembled in 1620. Charles began his reign by retaining as his chief adviser

his father's favourite, the unpopular, unprincipled and incapable Buckingham. At the same time the difficulties in which he was involved by the war that had just been entered into with Spain, offered to the popular party an opportunity of pursuing their objects, which seemed too promising to be neglected.

The reign commenced accordingly with a contest between the king and the parliament, the latter firmly refusing to grant the supplies demanded by his Majesty until they had obtained both a redress of grievances and a limitation of the prerogative. Charles, on his part, met the resistance of the parliament both by insisting upon preserving the prerogative entire, and by boldly putting it in force. In the course of this first contest three parliaments were successively called together and dismissed. The first met 13th of June 1625, and was dissolved 12th of August in the same year; the second met 6th of February 1626, and was dissolved, before it had passed a single act, 15th of June; the third met 17th of March 1628, was suddenly prorogued 26th of June, was called together for a second session 20th of January 1629, and was finally dissolved 10th of March of the same year. All this time the proceedings of the king continued to be of the most arbitrary character. Money was collected from the people by force; the influence of the crown was exercised in the most open manner to overawe the judges, in cases in which the liberty of the subject was concerned; the first privilege of parliament itself was violated by the seizure of members of the House of Commons, and their commitment to prison, for words alleged to have been spoken by them in debate. Nor is Charles free from the charge of having resorted to manœuvring and subterfuge to escape from the demands with which he was pressed. He is especially exposed to the charge of such insincerity and indirectness by his conduct in the affair of the Petition of Rights, which was passed in the first session of his third parliament, and to which he was eventually compelled to give his assent. This was the greatest, indeed it may be said the only victory obtained by the popular party in the course of the struggle; and it was rendered ineffectual for the present by the temporary success of the king in the plan which he at length adopted of governing without parliaments. Immediately before entering on this line of policy he wisely made peace, first, on the 14th of April 1629 with France, with which power he had entered (in July 1626) into a foolish war, every operation in which was a disgraceful failure; and secondly, on the 5th of November 1630 with Spain, the war with which had not been more creditable to his arms. Meanwhile also the assassination of Buckingham, on the 23rd of August 1628, had rid him of this evil adviser.

His principal advisers now were the queen, Bishop Laud, and Wentworth, created earl of Strafford. The state of things now established, and which may be described as the complete subjugation of the constitution by the prerogative of the crown, lasted for nearly eight years. The only memorable attempt at resistance was that made by Hampden, who refused to pay his assessment of ship-money, and whose case was argued before the twelve judges in April 1637, and decided in favour of the crown. Meantime however the opposition of the people of Scotland to the Episcopal form of church government, which had for some time been established among them, suddenly burst out into a flame. The first disturbances took place at Edinburgh, in the end of July 1637, and by the beginning of the following year the whole country was in a state of insurrection against the royal authority. In these circumstances Charles called together his fourth parliament, which met on the 13th of April 1640. The temper which the members showed however induced him to dissolve it on the 5th of May following. But the Scotch army having entered England on the 20th of August, he again found himself forced to have recourse to the representatives of the people. The result was, the meeting on the 3rd of November of a fifth parliament, which is generally known under the name of the Long Parliament.

The first proceedings of this assembly amounted to entering into a complete alliance with the Scottish insurgents. By one bill after another the king was stripped of all the most objectionable of his prerogatives. The Commons also voted that no bishop shall have any vote in parliament nor bear any sway in temporal affairs, and that no clergyman shall be in the commission of the peace. Of his advisers, Laud was sent to the Tower, and Strafford was executed in conformity with an act of attainder, his assenting to which has always been regarded as one of the great stains on the character of Charles. Laud also was executed after he had remained a prisoner in the Tower more than four years. After having yielded everything else however, Charles refused his assent to the Militia Bill, which was presented to him in February 1642, the object of which was to transfer all the military power of the kingdom into the hands of the parliament. The first blood drawn in the civil war which followed was at the indecisive battle of Edgehill, fought on Sunday, the 23rd of October, in that year. After this the war extended itself over the whole kingdom. For some time success seemed to incline to the royal side, and at the beginning of the year 1644, throughout both the west and the north of England, all opposition to the king was nearly subdued. In February of that year however another Scottish army crossed the border, and on the 2nd of July, at Marston Moor, the royalists sustained a defeat from the combined Scottish and parliamentary forces, which proved a fatal blow to the king's affairs. The brilliant exploits of the Marquis of Montrose in Scotland, at the end of this year and the beginning of

the next, were thrown away in the circumstances in which his royal master now was. At length, on the 14th of June 1645 was fought the battle of Naseby, which may be said to have finished the war. On the 5th of May 1646 Charles delivered himself up to the Scotch army encamped before Newark, who on the 30th of January 1647 gave him up to the commissioners of the English parliament. On the 3rd of June he was forcibly taken by Cornet Joyce out of the hands of the commissioners, and carried to the army then lying at Tripplow Heath, and now in open rebellion against their old masters of the parliament. On the 16th of August he was brought by the army to Hampton Court, from which he made his escape on the 11th of November, and eventually sought refuge with Hammond, the parliamentary governor of the Isle of Wight. Here he was detained a close prisoner in Carisbrook Castle till the 30th of November 1648, when he was seized by Colonel Ewer, and carried to Hurst Castle, on the opposite coast of Hampshire, by an order of the council of officers in the army. Meanwhile risings in his favour, which had been attempted in various parts of the kingdom, were all suppressed without difficulty by the now dominant army. An army in the Presbyterian interest, which was advancing from Scotland under the conduct of the Duke of Hamilton, was met on the 17th of August at Langside near Preston by Cromwell, who after completely routing it penetrated as far as Edinburgh, and reduced everything to subjection in that quarter. On the 6th of December, Colonel Pride took possession of the House of Commons, with a strong detachment of soldiers, and cleared it by force of all the members, except the minority of about 150, who were in the independent interest. On the 23rd the king was brought in custody to Windsor, and on the 15th of January 1649, to St. James's. On the 20th he was brought to trial in Westminster Hall, before what was designated the High Court of Justice. Sentence of death was pronounced against him on the 27th, and he was executed by decapitation on a scaffold erected in front of the Banqueting House at Whitehall, at two in the afternoon of the 30th.

Charles I. had eight children by Queen Henrietta, of whom six survived him, namely, Charles, prince of Wales, and James, duke of York, afterwards kings of England; Henry, afterwards created duke of Gloucester; Mary, married to William, prince of Orange, by whom she became mother of William, afterwards king of England; Elizabeth, who died a prisoner in Carisbrook Castle, 8th of September, 1650, in her eighteenth year; and Henrietta Maria, who married Philip, duke of Orléans, from whom, through a daughter, is descended the royal family of Sardinia.

The literary works attributed to King Charles have been collected and published under the title of 'Reliquiæ Sacrae Carolinæ.' A list of them may be found in Horace Walpole's 'Royal and Noble Authors.' They consist chiefly of letters and a few state papers, and of the famous 'Eikon Basilike,' which first appeared immediately after the death of the king: but his claim to the authorship of this work has been much disputed, and is now generally considered to have been disproved, though the Rev. Dr. Ch. Wordsworth in his work entitled, 'Who wrote the Eikon Basilike,' and the replies which he published in answer to the reviews of that work, has strongly contended that the 'Eikon' was the production of the king. Charles however was certainly one of the most elegant and forcible English writers of his time, and a great friend to the fine arts, which he encouraged in the early part of his reign.

(The original authorities for the history of the reign of Charles I. are very numerous. Among those of greatest importance may be mentioned Rushworth's 'Historical Collections;' Whitelock's 'Memoirs of English Affairs;' Clarendon's 'History of the Grand Rebellion;' and May's 'History of the (Long) Parliament;' to which must be added, both for its invaluable mass of original letters, as well as for the 'Elucidations' of the editor, Carlyle's 'Letters of Oliver Cromwell.' An important recent addition to the documentary matter is the collection of letters despatched weekly by Charles to his queen during the whole of the year 1646, and printed under the editorial care of Mr. J. Bruce, by the Camden Society, 1856. The general reader will find perhaps a sufficiently ample detail of the events of the time in the histories of Rapin, Hume, and Lingard, and he will do well to read the recent series of works on this period by M. Guizot, as exhibiting Charles and his opponents from a point of view somewhat different from that of the English historians, and also as giving the running commentary of a thoroughly well-informed historian and statesman, who has himself lived and taken part in a revolutionary struggle in many respects bearing no faint resemblance to that of the reign of Charles I. It will be enough to mention the volumes of Brodie, Godwin, D'Irasci, &c., as among the more recent works on the reign of Charles I.)

CHARLES II., King of England, the second son of Charles I., was born on the 29th of May, 1630. His elder brother, named Charles James, born 18th March 1620, had died on the day of his birth. On the breaking out of the civil war, in 1642, the Prince of Wales, then only twelve years of age, was appointed by his father to the command of the troop of horse which he raised as a body-guard on taking up his quarters at York; and in 1645 he was sent to serve with the royal troops in the west, with the title of general. On the ruin of the royal cause after the battle of Naseby, the prince retired, first to Scilly, and afterwards to Jersey, from whence in September 1640, he went to Paris, and joined the queen, his mother. He after-

wards took up his residence at the Hague, and being there when he received the news of the death of his father, he immediately assumed the title of king. On the 3rd of February 1649, he was proclaimed king of Scotland at Edinburgh. Meantime he had left Holland, and having gone in the first instance to Paris, had afterwards proceeded to Jersey. There he received the deputy of the Committee of Estates of Scotland, and agreed to accept the crown of that kingdom on the conditions imposed by the Presbyterians, who were the dominant party there. He arrived in the north of Scotland 23rd of June 1650, and having been forced to take the covenant before landing, was again proclaimed at Edinburgh on the 15th of July. On the 1st of January 1651, he was crowned at Scone. Cromwell however had already made himself master of the greater part of Scotland; on which Charles adopted the resolution of marching to the south. He entered England on the 6th of August, and taking possession of the city of Carlisle, was there proclaimed king. The battle of Worcester however in which he was signally defeated by Cromwell, on the 3rd of September, put an end to his enterprise. For some weeks he wandered about in disguise; at last on the 15th of October he embarked at Shoreham, in Sussex, and a few days after arrived in safety at Fescamp, in Normandy. From Fescamp he went to Paris, where he remained till June 1654. He then retired, first to Aix-la-Chapelle, and afterwards to Cologne; but being obliged to leave the French territory on peace being concluded between England and France, in October 1655, he retired to Bruges and resided afterwards principally at that town and at Brussels. He was at Brussels when he received the news of the death of Oliver Cromwell, in the beginning of September 1658. In the confusion into which everything fell in England after the resignation or deposition of the protector Richard, Charles removed to Calais, in August 1659, that he might be ready to take advantage of circumstances. He had still however to wait for some time longer. He opened a negotiation with General Monk, in April 1660, at which time he was at Breda, having arrived there on the 4th of that month. His letters to the House of Lords, his majesty's gracious declaration to all his loving subjects (in which he promised much that he never performed), and his letter to the House of Commons, are all dated from the court at Breda in April 1660. On the 1st of May the parliament voted his restoration, and he was proclaimed in London on the 8th. He embarked at the Hague on the 23rd of the same month, and entered London on the 29th.

We can give only a very general sketch of the progress of events during this reign. It commenced with a complete restoration of the ancient order of things, both in church and state. Although such of those concerned in the condemnation of the preceding king as could be apprehended were tried and executed, this measure of vengeance appears to have been in accordance with the popular sentiment of the time; and even the ejection of the Presbyterian clergy, which took place in August, 1662, excited no general manifestation of feeling against the government. The first of Charles's acts which seem to have been decidedly unpopular were his sale of Dunkirk to France, and his declaration of indulgence, intended to favour the Catholics, both of which proceedings took place in the latter part of this year. From this time Lord Clarendon, who had till now been the king's chief adviser, but who had opposed the indulgence, began to lose his influence at court. That minister also speedily lost his popularity by resisting the war with Holland, into which feelings of commercial jealousy were precipitating the parliament and the nation. The war broke out in February 1665, and was soon made more serious by a rupture with France. Hostilities however were terminated for the present by the peace of Breda, concluded 10th of July 1667. This event was speedily followed by the dismissal of Clarendon from the administration, and eventually his banishment from the realm by act of parliament. In January 1668 was concluded, by the exertions of Sir William Temple, the treaty of triple alliance (as it was called) between England, Holland, and Sweden, with a view of opposing the schemes of France, almost the only meritorious act of this disgraceful reign. It was not long however before the formation of the famous ministry known by the name of the Cabal, whose designs were to make the power of the English crown absolute by the aid of the king of France, overturned the state of things thus established. An alliance with France was followed by a quarrel with Holland, against which power war was declared in March, 1672. These transactions however roused a violent popular opposition both in the nation and in parliament; and after Shaftesbury, the head of the ministry, had retired from the storm, the king was compelled to make peace with Holland in February, 1674. But, although now standing neutral in the war, he still maintained a close connection with the French king, from whom indeed there is no doubt that he was in the receipt of an annual pension.

The most memorable affair of the following years was the announcement, in 1678, of the pretended Popish Plot, in the midst of the ferment excited by which Charles, apprehensive of the lengths to which the parliament, participating in the popular excitement, appeared to be ready to go, adopted the bold course of dissolving that body, which had sat, one year excepted, during the whole course of the reign. Of three more parliaments however which he afterwards successively called, none turned out more compliant or manageable; and he dissolved the last of them, which had been summoned to meet at

Oxford on the 28th of March 1681, after it had sat only a week. In the first of the three, which met in March, 1679, the Habeas Corpus Act was passed. Meanwhile an alarming insurrection of the Scotch Covenanters, driven mad by the oppressive administration of Lauderdale, had been suppressed by their defeat at Bothwell Bridge, on the 22nd of June 1679. From the year 1681 Charles governed without parliaments, and after the most arbitrary manner. In 1683 many of the municipal corporations in the kingdom were compelled to surrender their charters into the hands of the king, by writs of 'quo warranto' being issued against them. Their charters were restored with such modifications as placed the municipalities entirely under the influence of the crown, and made them subservient to the king's purpose of having the House of Commons under his absolute control. (See the charters of Bedford, Ipswich, Lynn Regis, &c., granted by Charles II.) But Charles did not live long enough to meet a House of Commons elected under this system. The outrageous proceedings of the government at length provoked the conspiracy of some of the friends of liberty and the constitution, known by the name of the Rye-House Plot, the detection of which was followed by the execution of Lord Russell and Algernon Sidney, the two most eminent persons involved in it, and of several of their subordinate associates. Charles was suddenly seized with apoplexy on the 2nd of February 1685, and expired on Friday the 6th. He had for some time been a Roman Catholic, though the fact was carefully concealed, and he died in communion with that church.

Many of the legislative measures of this reign were of great importance. By the Corporation Act, Roman Catholics and Dissenters were excluded from all corporate offices, and it is only in our own day that the exclusion was repealed: this act however it should be remembered was carried in direct opposition to Charles and the court. The Habeas Corpus Act, as already mentioned, was passed in this reign. By a statute passed in the twelfth year of this king's reign, the old military tenures, one of the most oppressive relics of feudalism, were abolished, and one tenure of free and common socage was established for all the freehold lands of the laity. The right of wardship of infant heirs to lands held by military tenure, a right which was for the benefit of the guardian rather than the ward, ceased by the same statute, which enabled every father, by deed or will, to appoint guardians of his estates, and of course of his infant children.

Charles II. was married on the 21st of May 1662, to Catherine, daughter of John IV. king of Portugal, who long survived him; but he had no children by his queen. His natural children were, 1, James, duke of Monmouth, by Mrs. Lucy Walters, born at Rotterdam in 1649, ancestor of the dukes of Buccleuch; 2, Mary, also by Mrs. Walters; 3, Charlotte-Jemima-Henrietta-Maria Boyle (alias Fitzroy), by Elizabeth Viscountess Shannon; 4, Charles, surnamed Fitz-Charles, by Mrs. Catherine Peg; 5, another daughter by Mrs. Peg, who died in infancy; 6, Charles Fitzroy, duke of Southampton, by the Duchess of Cleveland; 7, Henry Fitzroy, duke of Grafton, by the same, ancestor of the dukes of Grafton; 8, George Fitzroy, duke of Northumberland, by the same; 9, Charlotte Fitzroy, by the same; 10, Charles Beauclerc, duke of St. Albans, by Mrs. Nell Gwynn, ancestor of the dukes of St. Albans; 11, Charles Lenox, duke of Richmond, by Louisa Querouaille, a French woman, created Duchess of Portsmouth, ancestor of the dukes of Richmond; and 12, Mary Tudor, by Mrs. Mary Davis.

CHARLES EDWARD. [STUART FAMILY.]

CHARLES MARTEL was a natural son of Pepin d'Heristal, duke of Austrasia, and mayor of the palace under the last Merovingian kings. After Pepin's death Charles was proclaimed Duke of Austrasia, A.D. 715. Having defeated the king Chilperic II. (719), he obliged him to appoint him mayor of the palace, which in fact was the same thing as appointing him irresponsible prime minister, with all the real authority, while the king was a mere shadow. In 720 Chilperic died, and was succeeded by Thierry IV., under whom Charles continued to possess the chief authority in the state. Charles defeated Eudes, duke of Aquitania, and obliged him to do homage to the Frankish crown. He afterwards defeated the Saracens of Spain in a great battle between Tours and Poitiers (732), in which their numerous host was destroyed. He was called Martel (hammer) in consequence of this victory. The battle of Poitiers, and the subsequent conquest of Provence, where the Saracens had formed several strongholds, effectually checked the advance of the Mussulmans into the heart of Europe. This great victory of Charles Martel has been confounded by subsequent chroniclers and writers of romance with the expeditions of Charlemagne against the Saracens, which were far from being so momentous or so important in their results. Charles Martel also defeated the Frisians, annexed their country to the monarchy, and obliged them to embrace Christianity. He also fought successfully against the Saxons and other German tribes. After Thierry's death (736), Charles Martel continued to hold the supreme authority, under the title of Duke of the Franks, for the rest of his life, no king being appointed to succeed Thierry. Charles Martel died in 741, at Crécy, on the river Oise, and his two sons, Karlomann and Pepin, divided the dominions of the Franks between them. Charles Martel was not a favourite with the clergy of his time, because he obliged them to contribute towards the expenses of the war against the Saracens. He also is said to have conferred ecclesiastical benefices on some of his bravest soldiers.

CHARLES I., Emperor. [CHARLEMAGNE.]

CHARLES II., called the Bald, son of Louis le Débinaire, and king of France, was crowned Emperor of the West after the death of Louis II. in 875. He died in 877. He is noticed more fully as **CHARLES II. of France.**

CHARLES III., called the Fat, son of Louis the Germanic, and nephew of Charles II., was elected Emperor and King of the Romans in 911. He was at the same time king of France, but on account of his incapacity he was deposed from both thrones by a general diet of French and German lords, held at Mainz in 887, and died the following year, near Constance, in the greatest distress. From that epoch the crown of Germany was finally and for ever separated from that of France. [See **CHARLES III. of France.**]

CHARLES IV., of the house of Luxembourg, King of Bohemia, was elected emperor in 1347. The most remarkable event of his reign is the promulgation of the Golden Bull at the diet of Nürnberg in 1356, which became the fundamental law of the German empire. By this bull the number of electors was fixed at seven—three ecclesiastical, the archbishops of Mainz, Trier, and Cologne; and four secular, the King of Bohemia, the Count Palatine of the Rhine, the Duke of Saxony, and the Margrave of Brandenburg, and to each of these was attached a high office of the imperial state or household. The Archbishop of Mainz was appointed archchancellor of the empire, the Archbishop of Cologne archchancellor of the kingdom of Italy, and the Archbishop of Trier archchancellor of the kingdom of Arles, a feudal dependence of the imperial crown. The secular electors had nominal offices in the imperial household assigned to them. The rights and privileges of the electors, and the forms of the election, were likewise defined. Charles died in November, 1378, at Prag in Bohemia, after thirty years of a comparatively peaceful reign. He is charged by German historians with having preferred the interests of his own family to those of the empire. His son Wenceslaus succeeded him both as emperor and as king of Bohemia.

CHARLES V. of Germany (Don Carlos I. of Spain) was born at Ghent in the year 1500. His father, the Archduke Philip of Austria, was the son of the emperor Maximilian I., and of Mary, the daughter of Charles the Bold, and heiress of the house of Burgundy. His mother was Joanna, the only child of Ferdinand of Aragon and Isabella of Castile. By the death of Philip in 1506, Charles inherited the Netherlands and Franche Comté. He was brought up in Flanders, under the care of William de Croy, lord of Chièvres, whom his grandfather Maximilian appointed to be his governor, with Adrian of Utrecht as his preceptor. [ADRIAN VI.] By the death of Ferdinand of Aragon, January 1516, Charles, then sixteen years of age, inherited the crowns of Aragon and Castile, with their vast possessions in the New World, as well as the kingdoms of Naples and Sicily, and the island of Sardinia. After the death of his grandfather Maximilian in 1519, he was elected Emperor of Germany, his brother Ferdinand being entrusted with the administration of the hereditary dominions of the house of Austria.

Upon the death of Ferdinand of Spain, Joanna was acknowledged queen; but being in a state of imbecility, she was unable to exercise the sovereign power. Charles was therefore proclaimed king conjointly with his mother. Cardinal Ximenes, the celebrated minister of Ferdinand, sent pressing invitations to Charles to repair to his Spanish kingdoms; but Charles, young and inexperienced, and surrounded by Flemish ministers and favourites who did not wish for his departure from Flanders, delayed more than a twelvemonth before he set out for Spain. At last, in September 1517, he embarked with his Flemish court, and landed at Villa Victoria in Asturias, where the Castilian nobility hastened to meet him. Ximenes also, old and infirm as he was, went to meet the young king; but he fell ill on the road, and died at Aranda, after receiving a cold letter of dismissal from Charles. Discontent soon showed itself among the Castilians at the insolence and rapacity of the Flemish courtiers. William de Croy, his wife, his nephew, and Sauvage, whom Charles was imprudently induced to appoint Chancellor of Castile in place of Ximenes, and several other Flemish favourites, thought of nothing but amassing money in Spain and transmitting it to Flanders. Upon Charles assembling the Cortes of Castile at Valladolid, marks of a stubborn spirit soon discovered themselves among the members. At Zaragoza he was obliged to swear to maintain the rights and liberties of the Aragonese before they would acknowledge him king. In Catalonia he likewise assembled the Cortes of that principality. While he was in this province he received the news of the emperor Maximilian's death, which happened in January 1510. A few months afterwards he was himself elected to succeed his grandfather, and he hastened his preparations in order to leave Spain for Germany. Having appointed Adrian of Utrecht regent of Castile, Don Juan de Lanuza viceroy of Aragon, and Don Diego de Mendoza viceroy of Valencia, he sailed from Coruña in May 1520; landed at Dover on his way, where he had an interview with Henry VIII. and Cardinal Wolsey, who showed him great attention; and was crowned Emperor at Aix-la-Chapelle, 23rd of October 1520.

Charles found Germany disturbed by Luther's incipient schism. At a diet held at Worms in January 1521, Luther was summoned to appear, and Charles gave him a safe-conduct for his security. Luther came, refused to retract his opinions, and appealed to a general council. He was however allowed to depart in safety, the majority of the diet,

and Charles at their head, refusing to renew the disgraceful scenes of Constance. After his departure, an edict of outlawry was issued against him in the name of the emperor and by the authority of the Diet. For the sequel of this momentous controversy see **LUTHER.**

While Charles was absent from Spain, the towns of Castile broke out into open insurrection. The nobles were hurt at the influence and interference of the Flemings in the affairs of Spain, and especially at the appointment of Adrian of Utrecht, Charles's former preceptor, as head of the Regency, whose stern and rigid demeanour was not calculated to soothe the pride of the Castilian nobility. The higher clergy were likewise offended at the nomination of young William de Croy, the nephew of the Lord of Chièvres, to the archbishopric of Toledo; and fearing that ecclesiastical benefices would be henceforth bestowed upon strangers, they joined the nobles and commons, and excited the people to resistance by their sermons and writings. "It is certain," says a modern Spanish writer, "that if the procuradores or commons in the Cortes and the towns of the Holy League had offered to maintain unaltered the temporal authority and privileges of the Church, most of the bishops would have sided with them." (A. de Arguella, 'Introducción al Examen Histórico de la Reforma Constitucional.') The procuradores or deputies of the towns showed a still more determined spirit. The remonstrances of the Cortes being unheeded by the Regents, several of the towns openly revolted in 1520, and convoked a junta of their deputies. Padilla, a young nobleman of Toledo, placed himself at the head of the Comuneros, as the party of the towns was called. They assembled troops, issued proclamations, and renounced all allegiance to the Regency, but appealed to Charles himself, to whom they sent a statement of their grievances, asking for immediate redress, and the dismissal of obnoxious regents and ministers. Padilla took possession of the person of Joanna, who was still styled in all public acts Queen of Castile in conjunction with her son. Joanna had been for years insane; but when Padilla and others spoke to her of the injustice which they had suffered, she seemed to have a lucid interval, and promised redress. She even received in state the deputies of the towns and the members of the junta, who kissed her hand and swore allegiance to her; but after the ceremony she relapsed into her usual melancholy absent mood, and they were unable to make her sign any paper. For some months the affairs of the Comuneros seemed to prosper; they defeated the troops of the Regency at Tordeasillas, and almost all the towns of Castile embraced their cause. But the Junta having showed a disposition to curtail the privileges of the nobility and clergy, among others the important one of being exempt from taxes, they lost the support of those two powerful bodies. The commons agitated the question of the former crown lands, of which many of the nobility had got possession in course of time, and proposed that they should be re-annexed to the royal domains. The nobles now openly espoused the part of the crown, and armed their vassals. They attacked the Comuneros at Villareal, defeated them, and took Padilla prisoner, who was immediately executed. His wife, Maria Pacheco, defended herself for a short time within Toledo, and at last contrived to escape into Portugal. Charles soon after came into Spain, and assumed the reins of government. He behaved with much indulgence, issued an amnesty for all past political offences, excepting only the leaders, whom however he showed no eagerness to seek after. The war which broke out about that time between him and France soon engrossed all his attention, and he only assembled the Cortes of Castile to demand fresh supplies of money, till at last they refused in 1539, alleging the privilege of the nobility and clergy to be exempt from taxes. He dismissed them, and from that time summoned neither the nobles nor clergy, but merely the deputies of the eighteen cities, who proved sufficiently manageable. Charles's armies were triumphant in Italy; they drove the French from Lombardy, took Genoa, and at last, in February 1525, gained the great battle of Pavia, and made Francis I. prisoner. Francis was taken to Madrid, whence he was released, by a convention between him and Charles, in January 1526, but the war broke out afresh soon after. The pope and the Florentines, having taken alarm at the power of Charles V., joined the French. In 1527 the troops of Charles V., commanded by the Connétable of Bourbon, marched upon Rome, took and plundered it in a shameful manner, and made the pope prisoner. [CLEMENT VII.] Meantime, Charles V. at Madrid was ordering prayers to be offered up in the churches for the deliverance of the pope, saying that he was obliged to make war against the temporal sovereignty of Rome, but not upon the spiritual head of the church. The treaty of Cambrai, in 1529, restored peace between Charles and Francis, who gave up all his claims to Italy and Flanders. In June of the same year, Charles and Pope Clement were also reconciled; and in March 1530 Charles was crowned by the pope at Bologna as emperor and king of Lombardy. He then united his troops to those of the pope against the republic of Florence, which still held out; and in August of the same year the Florentines were obliged to capitulate, and to receive for their prince Alexander de' Medici. [COSMO I. DE' MEDICI.]

Charles after his coronation set out for Germany, where the consequences of the religious schism became every day more threatening. At a great diet, held at Augsburg in June 1530, the confession of faith of the Lutheran Church was solemnly presented to him. Charles adopted a temporising policy towards the Protestants of Germany. He allowed them the free exercise of their religion, which in fact he could

not refuse without entering into a war of extermination; but he referred ultimately the question to the general council, which he urged the pope to convoke, but the council (that of Trent) did not take place till after Charles's death. Charles was not intolerant by disposition; his mind was of an inquisitive turn, and he showed at various times considerable indulgence towards the doctrines of the Protestants. After his death doubts even of his orthodoxy were entertained by the Spanish Inquisition, which imprisoned and examined some of his familiar attendants.

In 1535, Europe being at peace, Charles sailed with a large armament for Tunis, where Khair Eddin Barbarossa, the dread of the Christians in the Mediterranean, had fortified himself. Charles, supported by his admiral, Andrea Doria, stormed La Goletta, and defeated Barbarossa; the Christian slaves in Tunis meantime having revolted, the gates of the city were opened, and the Imperial soldiers entering in disorder began to plunder and kill the inhabitants, without any possibility of their officers restraining them. About 30,000 Mussulmans of all ages and both sexes perished on that occasion. When order was restored, Charles entered Tunis, where he re-established on the throne Muley Hassan, who had been dispossessed by Barbarossa, on condition of acknowledging himself his vassal, and retaining a Spanish garrison at La Goletta. Charles returned to Italy and landed at Naples in triumph, having liberated 20,000 Christian slaves, and given, for a time, an effectual blow to Barbarossa and his piracy. On his return to Europe in 1536, he found King Francis again prepared for war. The French invaded Piedmont, but Charles collecting his forces in the north of Italy, drove them back. He invaded Provence, besieged Marseille, but could not take it, and after having devastated Provence and lost nearly one half of his army, he withdrew into Italy with the rest. In 1538 a truce for ten years was entered into between Francis and Charles through the mediation of the pope. The truce however was broken in 1542. In 1539 the people of Ghent, Charles V.'s native place, revolted on account of some encroachment on their privileges, and the rebellion threatening to spread to other towns of Flanders, Charles, who was then in Spain, asked Francis for a safe conduct to cross France on his way to Flanders, which Francis immediately granted. He was received by Francis with the greatest honours, although some of the French courtiers advised him to take advantage of the opportunity to secure the person of Charles, and oblige him to sign the cession of the duchy of Milan in favour of one of Francis's sons; but Francis disdained the suggestion. The citizens of Ghent having surrendered at discretion were treated by Charles with great severity; 26 of the leaders of the revolt being executed in 1540.

In 1541 Charles sailed with an armament to attack Algiers, against the advice of his old admiral, Andrea Doria. He landed near that city, began the siege, and built a redoubt on a hill commanding the town, which is still called the Fort of the Emperor, but his troops were cut off by disease and by the Arabs. A dreadful storm dispersed his fleet, and Charles re-embarked with a small portion of his men, leaving his artillery and baggage behind.

In 1542 war broke out again between Francis and Charles. The ostensible cause of it was the seizure which had taken place the year before of Rincon, a Spanish refugee, who had gone over to Francis, and had been sent by him to Constantinople to contract an alliance with Sultan Solymán against Charles. Rincon succeeded, returned to France, and set off again for Constantinople with Fregoso, a Genoese refugee, whom Francis had also taken into his service. These two emissaries, in passing through Italy, were seized by the Marquis del Vasto, governor of Milan, put to the torture, and then put to death, as traitors to their sovereign. In accordance with the treaty, Solymán sent Barbarossa with a large fleet to ravage the coasts of Italy, and join Francis's squadron on the coast of Provence. [BARBAROSSA.] The war was carried on by land in Flanders, Roussillon, and in Piedmont, where Charles's troops lost the battle of Cerisoles against the Count of Enghien. Charles however invaded Champagne; and his ally, Henry VIII. of England, entered Picardy in 1544, but soon after peace was made at Crespi between Charles and Francis. One of the terms of this peace was that both sovereigns engaged themselves to destroy Protestantism in their respective dominions. In France they began to fulfil this engagement by massacring the Protestants in the towns of Cabrières and Merindol; in Germany Charles proceeded by less sanguinary and more formal means. The diet of Worms, in 1545, passed several resolutions against the Protestants, in consequence of which they rose in arms in 1546, under Frederic, elector of Saxony and the landgrave of Hesse. Charles defeated them and took the two princes prisoners. He gave the electorate of Saxony to Maurice, a kinsman of Frederic. Maurice acted with consummate skill, so as to deceive Charles himself, during several years, as to his real intentions. He appeared to side with the emperor, fought bravely for him, but at the same time took care that the cause of the Protestants should not be rendered totally desperate; he urged Charles to liberate the landgrave of Hesse, who was his father-in-law, and on Charles's repeated refusals he entered into secret correspondence with the other Protestant princes to be ready to rise at a given signal. At last, in 1552, Maurice threw off the mask, by taking the field at the head of the Protestant confederacy, and was very near surprising the emperor at Innsbruck, whence Charles was obliged to fly in a hurry. He also frightened

away the fathers of the council assembled at Trent. At this crisis Henri II. of France, who had succeeded Francis I., resumed hostilities against the emperor. Under these circumstances Charles was obliged to sign the treaty of Passau with the Protestant princes of Germany, in August 1552, by which the Protestants obtained the free exercise of their religion in their dominions. This treaty was afterwards confirmed by a solemn declaration of the diet at Augsburg in 1555, which was called the "peace of religion," for it was the foundation of religious freedom in Germany.

The war continued with the French on one side and with the Turks in Hungary on the other. In 1554, Philip, Charles's son, married Mary, queen of England, upon which occasion his father made over to him the crowns of Naples and Sicily. In 1555 Joanna of Spain died, after having been insane for nearly fifty years. Charles being now nominally as well as in reality sole king of the Spanish monarchy, put in effect a resolution which he had formed for some years before. Having assembled the States of the Low Countries at Brussels, on the 25th of October 1555, he appeared there seated between his son Philip and his sister, the Queen of Hungary, and resigned the sovereignty of the Netherlands, his paternal dominions, to Philip. He then rose, and leaning on the Prince of Orange for support, as he was suffering severely from the gout, he addressed the assembly, recapitulating the acts of his long administration. "Ever since the age of seventeen," he said, "he had devoted all his thoughts and exertions to public objects, seldom reserving any portion of his time for the indulgence of ease or pleasure. He had visited Germany nine times, Spain six times, France four, Italy seven, Flanders ten times, England twice, and Africa twice; had made eleven voyages by sea; he had not avoided labour or repined under fatigue in the arduous office of governing his extensive dominions; but now his constitution failed him, and his infirmities warned him that it was time to retire from the helm. He was not so fond of reigning as to wish to retain the sceptre with a powerless hand!" He added that "if, in the course of a long administration, he had committed errors—if, under the pressure of a multiplicity of affairs, he had neglected or wronged any one of his subjects, he now implored their forgiveness, while for his part he felt grateful for their fidelity and attachment, and he should with his last breath pray for their welfare." Then turning to Philip, he gave him some salutary advice, especially to respect the laws and the liberties of his subjects; after which, exhausted with fatigue and emotion, he closed the impressive scene. Two weeks after he made over to Philip, with the same solemnity and before a large assembly of Spanish grandees and German princes, the crowns of Spain and of the Indies. In the following year, August 1556, he likewise resigned the imperial crown to his brother Ferdinand, who had already been elected king of the Romans and his successor; and after visiting his native place, Ghent, he embarked for Spain with a small retinue. On landing at Laredo in Biscay he kissed the ground, saying, "Naked I came out of my mother's womb, and naked I return to thee, thou common mother of mankind." In February 1557, accompanied by one gentleman attendant and twelve domestics, he retired to the monastery of St. Yuste of the Hieronymite order, situated near Plasencia, in Estremadura, in a sequestered valley at the foot of the Sierra de Gredos, where he had caused apartments to be prepared for him. There he lived for about eighteen months, employed either in his garden, or in contriving works of ingenious mechanism, of which he was remarkably fond, and in which he was assisted by Turriano, a clever mechanician of the time, and occasionally diverting himself with literature, in which he was assisted by a learned gentleman of the chamber, William Van Male. In the last six months of his existence, his body becoming more and more enfeebled by repeated fits of the gout, his mind lost its energy, and he fell into gloomy reveries, and the practice of ascetic austerities. Among other things he had his own funeral obsequies performed in the chapel of the convent (August 30, 1558). The fatigue and excitement of this ceremony, in which he took part, brought on a fit of fever, which in about three weeks carried him off: he died on the 21st of September 1558, in his fifty-ninth year.

(Antonio de Vera, *Vida y Hechos de D. Carlos I.*; Robertson, *History of Charles V.*; Botta, *Storia d'Italia*; and numerous other historians. The circumstances of the last months of his life have recently been narrated (from original documents in the French Foreign-Office) in a work of remarkable interest, *The Cloister-Life of the Emperor Charles the Fifth*, by W. Stirling.)

CHARLES VI. of Germany, born in 1685, was the son of the Emperor Leopold I. Charles II. of Spain, the last offspring of the Spanish branch of the house of Austria, being childless, Leopold claimed the inheritance of the crown of Spain for one of his children, as next of blood. He fixed upon his younger son, the Archduke Charles, as the presumptive heir, and king Charles confirmed the choice by his will; but the intrigues of Louis XIV. and his friends at the court of Spain made the king alter his will before his death in favour of Philip of Anjou, whose grandmother was daughter to Philip IV. of Spain and sister to Charles II. This gave rise to the long war of the Spanish succession, in which most of the other European powers took part. After the death of Charles II. in November 1700, Philip of Anjou was proclaimed under the name of Philip V., but the emperor, England, Holland, and Portugal supported the claims of the Archduke Charles, who landed at Lisbon in March

1704 with some English and Dutch troops, and was assisted by the Portuguese. Catalonia and Aragon declared themselves for Charles, who entered Madrid in 1706, and was there proclaimed king of Spain. The Duke of Berwick however drove him away from the capital, and Charles retired into Valencia. The battle of Almanza, in April 1707, decided the question in favour of Philip. The war continued for several years more in the eastern provinces of Spain, as well as in Italy, Germany, and the Netherlands, till 1714, when Charles, who in 1711 had succeeded his elder brother Joseph I. on the imperial throne, gave up his claims to the Spanish crown by the treaty of Rastadt, retaining however the kingdom of Naples and the Island of Sardinia, which last he afterwards exchanged for Sicily. In 1716 the Emperor Charles joined the Venetians in a war against the Turks, whom the Prince Eugene defeated at Peterwaradin, after which he took Belgrade and a great part of Serbia, which, as well as Temeswar, were formally ceded by the Porte to Austria by the treaty of Passarowitz in 1718, but were afterwards lost again to Austria by the peace of Belgrade in 1739.

In 1724 Charles issued the Pragmatic Sanction, or fundamental law, which regulates the order of succession in the family of Austria. By this law, in default of male issue, Charles's eldest daughter, Maria Theresa, was called to the inheritance of the Austrian dominions, and her children and descendants after her. The Pragmatic Sanction was guaranteed by all the German princes and several of the other powers of Europe, with the exception of the French and Spanish Bourbons, who were always jealous of the power of Austria.

The death of Augustus II., king of Poland, in February 1733, was the signal of a new war on the part of the Bourbons against Austria, ostensibly on account of the Polish succession, which was disputed between Augustus III. and Stanislaus Leezinski. By the peace of Vienna in November 1735 the emperor gave up Naples and Sicily to Don Carlos, Infante of Spain, while the succession of Tuscany, after the death of Gian Gastone, the last of the Medici, who was childless, was secured to Maria Theresa of Austria and her husband Francis of Lorraine, who in 1739 took possession of that fine country. The Emperor Charles died at Vienna, 20th of October 1740, and was succeeded in his hereditary dominions, and afterwards in the empire, by his daughter Maria Theresa, after a long and memorable war known by the name of the war of the Austrian succession. [MARIA THERESA.] Charles was the last male offspring of the house of Austria Hapsburg. The present house, though frequently called the house of Hapsburg, is Austria-Lorraine, being the descendants of Maria Theresa and Francis of Lorraine.

CHARLES, the name of several of the kings of France. Charlemagne, especially by English writers, is commonly reckoned as Charles I. of France, and Charles le Chauve, as Charles II.; but then it is necessary, in order to bring the later monarchs into conformity with the admitted designations, to reckon both Charles le Gros, and Charles le Simple, as Charles III. There was doubtless much confusion of title while the Carolingian princes wore the crowns of both France and Germany, but it appears to be now the practice of French writers to omit Charlemagne from their list of Charleses, and commence with Charles le Chauve; and we shall do the same.

CHARLES I., Le Chauve (the Bald), the son of Louis le Débonnaire, and grandson of Charlemagne, was born at Frankfurt-on-the-Maine, A.D. 823: his mother, Judith, was the second wife of Louis, who had, before the birth of Charles, parted his dominions among his three sons—Lothaire, whom he associated with himself in the empire, and Pepin and Louis, to whom he gave respectively the kingdoms of Aquitaine and Bavaria. The birth of Charles was regarded by these princes with jealousy, which was greatly increased when, by a new partition of his dominions, Louis formed for Charles the kingdom of Germany, comprehending Switzerland, Swabia, and the Grisons (Sav.). In the year 833 Charles was shut up in a monastery, in the diocese of Trèves, by his brothers, who had successfully revolted against their father; but in a few years (839), new partitions of the empire, one previous to, and another consequent upon the death of Pepin, king of Aquitaine, gave to him much larger dominions than his first kingdom of Germany: the second partition assigned to him all that part of France which lies west of the Rhône and the Meuse.

Soon after the death of Louis le Débonnaire (840), Charles, now approaching manhood, was involved in hostilities with his brother Lothaire (who had claimed the succession to the imperial crown), and with his nephew Pepin, son of the deceased king of Aquitaine. He allied himself with his brother, Louis of Bavaria, and these two gained the victory in a sanguinary engagement at Fontenay, near Auxerre, over Lothaire and Pepin (841); but the victors were so weakened by the loss they had sustained, that Charles thought it prudent to retire across the Seine. In the following year, Lothaire, renouncing his claim to supremacy, made proposals of peace to his brothers, and the year 843 was signalised by the final partition of the empire of Charlemagne. By this partition Charles obtained the acknowledged possession of that part of France which lies to the west of the Meuse, Saône, and Rhône; and of that part of Spain which lies between the Pyrenees and the Ebro. The remainder of France, with Italy, formed the portion of Lothaire, and Germany became the portion of Louis, hence denominated Le Germanique. The French portion of Lothaire's

dominions took hence the names of France de Lothaire, Lotharingia, and in later times Lorraine.

The following years of the reign of Charles (843 to 858) were marked by the ravages of the Northmen, who took Rouen (841), Nantes and Saintes (843), Bordeaux (843 and 848), Paris (845 and 856), Tours (853), Blois (854), Orléans (856), and other places; by the sack of Marseille (848), by some Greek pirates; and by the wars with Noménoé of Bretagne and Pepin of Aquitaine, each of whom Charles was obliged to allow to remain in possession of a considerable portion of his dominions, with the title and power of king. In the war with Pepin, Charles put to death Bernard, duke of Septimania, his reputed father. In 852 Pepin was however delivered up, by one of his own partisans, Sanche, marquis of Gasconne, to Charles, who shaved his head and shut him up in a convent, from which he escaped to dispute again with Charles the sovereignty of Aquitaine. Before his escape the people of Aquitaine had offered their crown to Louis, son of Louis le Germanique, who accepted their offer, and in 855 Charles conferred the crown of this part of his dominions upon his second son, Charles, who was yet in his minority. The unhappy country of Aquitaine was ravaged by the troops of these rival claimants, as well as by the Northmen and Saracens, who came as their allies; and the people themselves, disgusted by their degenerate princes when in prosperity, but pitying them when reduced to adversity, shifted their allegiance from one to another with great facility. Charles made little effort to defend his kingdom from invasion, and incurred by his misconduct the contempt of his subjects.

In 858 the subjects of Charles called in his brother Louis le Germanique, to whom they offered the crown. Charles was obliged to abandon his kingdom, but he regained it the following year, and the influence of the church brought the brothers to a reconciliation. The following years of Charles's reign, though marked by the success of some of his ambitious schemes, yet brought little advantage to his people, who continued to suffer under the miseries of civil discord and the ravages of the savage Northmen. The mighty fabric of empire which Charlemagne had erected was hastening to decay through the misgovernment of his weak and worthless successors, and the kingly power was fast sinking, while the power of the great feudal lords was rising on its ruins. In 863 Charles had to engage in war with his sons—Louis, whom he had created king of Neustria, and Charles, king of Aquitaine—who had both married without his consent, and had been excited to revolt by the relations of their wives. They were however obliged to submit, though they seem to have obtained by their submission an increase of power and possessions. Charles of Aquitaine died miserably (866), in consequence of a wound accidentally received two years before. Pepin of Aquitaine had fallen again into the hands of Charles le Chauve, after having endeavoured in vain to support himself against him by means of the Northmen; and having been condemned to death as a traitor by a diet of the French (864), ended his changeful life some years after in a dungeon, to which he had been consigned by a commutation of his sentence.

In 866, Charles, disheartened by the successes of a party of Northmen who had ascended the Seine, concluded with them a most disgraceful treaty, agreeing to pay them four thousand pounds weight of silver, on condition that they should cease their depredations; to deliver up or make compensation for all the French whom they had reduced to slavery and who had escaped, and to pay a certain sum for every Northman who had been killed by his subjects. But those who infested the banks of the Loire do not seem to have been included in this treaty; with them therefore hostilities were continued, and in one of the conflicts with them, Robert le Fort, count of Anjou, the most celebrated of the French captains of his day, and the first of that race of 'dukes of France' which afterwards ascended the throne in the person of Hugues Capet, lost his life.

The emperor Lothaire, brother of Charles, had died in the year 855, and his kingdom had been divided between his three sons. Louis, who took the title of emperor, had Italy; Lothaire, the younger, had the provinces between the Rhine and the Meuse; and Charles those between the Rhône and the Alps. Upon the death of this Charles in 863, his portion was divided between his two brothers. Charles le Chauve was anxious to seize a portion of the spoil, but was obliged to forego his purpose. In 869, Lothaire the younger, who had been involved in a series of disputes with the pope, arising from his domestic circumstances, died, and his dominions were shared between his uncles, Louis le Germanique and Charles le Chauve, to the injury of the emperor Louis, his brother and rightful heir. Louis le Germanique subsequently restored his share of the spoil to the emperor; but Charles was not so scrupulous, and retained what he had seized.

In 875 the emperor Louis II. died without issue, and in him the elder branch of the descendants of Louis le Débonnaire became extinct. Louis le Germanique and Charles (both invited by the powerful lords of Italy, who desired to counterbalance the power of one by that of the other) hastened to take possession of their nephew's dominions; Charles going in person, and Louis sending his two sons, Karlmann and Charles le Gros. These young princes however were compelled or prevailed upon to withdraw, and Charles, by the favour of the pope, received the imperial crown at Rome on Christmas-Day 875, and was again crowned at Pontyon (between Châlons and Langres) in 876. Charles's dominions then attained their greatest extent: he

possessed all the countries now comprehended in France (except Alsace, Lorraine, and a part of Burgundy) and Italy. But he was not secure from attack : the Northmen, though their ravages had somewhat slackened, continued to infest the coasts and rivers ; and Louis, irritated by the retreat of his sons from Italy, attacked France (876), before Charles had returned from Italy, but upon his return he retreated. The death of Louis the same year offered new allurements to the ambition of Charles, who prepared forthwith to attack Louis of Saxony, one of the sons of the deceased prince and heir to one part of his dominions. The troops of Charles were defeated (876), and in the following year Charles was driven out of Italy by Karlomann, another of the sons of Louis, and ended his days at a place called Brios, in the neighbourhood of Mount Cenis in the Alps. He died in 877, at the age of fifty-four, having reigned thirty-seven years from the time of his father's death.

Charles experienced much trouble in his family : the rebellion of his sons Louis (who succeeded him, and is known in French history as Louis le Begue) and Charles has been noticed. His fourth son, Carloman, whom he had brought up in a cloister, a life quite unsuited to his turbulent genius, gave him much trouble by his disobedience ; but the unhappy youth was at last punished by the loss of his eyes, an infliction which he did not long survive. The pope, Adrian II., supported the rebellious prince, and addressed to his father a letter marked by arrogance as yet unparalleled in the feats of papal assumption. The king's reply was calm and dignified ; but the honour of it is probably due rather to Hincmar, who wrote it, than to the prince in whose name it was written. Charles was twice married ; his first wife was Hermentrude, daughter of Eudes, count of Orléans ; his second Richilde, daughter of Beuves, count of Ardennes, and sister of Richard, duke of Bourgogne and of Boson, afterwards king of Provence.

CHARLES II., known as Charles le Gros, or the Fat, was the son of Louis le Germanique, and by consequence nephew of Charles le Chauve. He was born about 832, and, upon the death of his father in 876, had inherited a portion of his dominions, which was designated the kingdom of Suabia, and included Suabia, Switzerland, and Alsace. By the death of his brother Carloman in 880, he acquired the kingdom of Italy, and was crowned at Rome, by the pope, emperor of the West, about the end of the same year or the beginning of the next. In 882 he obtained the kingdom of Saxony by the death of his other brother, Louis of Saxony, and the crown of France by the death of Carloman in 884. He thus reunited under one sceptre the dominions of Charlemagne, with the exception of that part of Spain which lies between the Pyrenees and the Ebro, and the country between the Rhône and the Alps, which had been formed into a kingdom by the successful ambition of Boson, and perhaps Bretagne and Gascogne. Charles however showed an utter incapacity of governing the extensive dominions thus acquired. The Northmen ravaged his coasts ; one of their chieftains, Godfrid, who had previously extorted from the cowardice of the empire the sovereignty of Friedland, began to stir again ; and Hugues, whom the church stigmatised as illegitimate, son of Lothaire II., desolated Lorraine, which he claimed as his inheritance. Charles determined to remove by treachery those whom he dared not face in battle ; and at a conference appointed by him, Godfrid was assassinated, and Hugues made prisoner, deprived of his eyes, and shut up in a convent.

In 885-86, Paris was besieged by the Northmen, and bravely defended for more than a year by Eudes, count of Paris, son of Robert le Fort, count of Anjou and duke of France, and two ecclesiastics, and it was not until it was reduced to the last extremity that Charles advanced to its relief. He entered Paris with his army, but not venturing to encounter the Northmen, who had concentrated their forces, he signed a treaty, by virtue of which he paid to the barbarians a considerable sum, to engage them to quit the environs of Paris and transfer the war more into the interior of France, to a country as yet little injured.

The charge which he made in 887 against his chancellor Liutward, bishop of Vercelli, tended by its consequences to increase the contempt into which Charles had fallen, and he was compelled to resign the imperial crown to his nephew Arnolph, an illegitimate son of Karlomann, king of Bavaria and Italy. He survived his deposition only a few weeks, dying early in the year 888 at a castle named Indinga, in Suabia.

CHARLES III., le Simple, was son of Louis II. le Begue, or the Stutterer, by Adelaide, who claimed to be the second wife of that monarch ; but her title to be regarded as his wife depended upon the validity of his first marriage. In the reigns of Louis III. and Carloman, the issue of the first marriage of Louis II., she was regarded as his concubine, and consequently Charles was looked upon as illegitimate ; but whatever defects there might be in his claim, they were disregarded when the discontented nobles thought it right to set him up in opposition to Eudes, count of Paris, who had been elected king of France upon the death of Charles le Gros. By these malcontents he was elected king at Reims in 893, and crowned by the archbishop of that city ; but his youth (he was only fourteen) and the weakness of his character incapacitated him from maintaining himself against Eudes. On the death of that prince, Charles, who had experienced various changes of fortune, was elected king in 898, without any

competitor, but over a circumscribed territory and with very limited power.

The reign of Charles was marked by a signal event, the cession to the Northmen, who, under their chief Rollo or Rollo, had committed great ravages, of that part of France called from them Normandie. This cession, however justly it may be ascribed to the weakness or the cowardice of Charles, was not in itself unwise ; the population of the province was replenished by an infusion of warlike inhabitants, and the activity and energy of the new settlers recovered the district from the desert state to which their previous ravages had reduced it. By the treaty in which the cession was made, Charles agreed to give his own daughter in marriage to Rollo, while Rollo and his barbarous followers consented to become Christians. The treaty was ratified at a meeting near the river Epte ; but when Rollo was required to do homage to Charles as his sovereign by kissing his foot, he refused, and deputed the duty to one of his followers, who performed his part so roughly as to overset the king : neither Charles nor his nobles ventured however to resent the insult.

Upon the decease of Louis, king of Germany, the nobles of Lorraine bestowed the sovereignty of that country upon Charles, while the rest of the Germans elected Conrad to the imperial crown. Wars with his vassals, and especially with Henry, duke of Saxony, prevented Conrad from vigorously attacking Charles ; but when the above-mentioned Henry came to the throne, he recovered a portion of Lorraine for the imperial crown. The remainder of Charles's reign was unfortunate. The Hungarians ravaged his dominions (919), and his powerful and malcontent nobles excited internal troubles. Charles managed to protract his downfall for a year or two ; but at last his subjects, irritated by the favour he showed to his confidant Haganon, whose humble parentage and arrogant conduct made him odious to them, drove him from his kingdom, which was seized by Robert, duke of France, and brother of the late king Eudes. By violating an armistice, Charles managed to surprise his rival. Robert was killed in the engagement, but his troops, under the command of his son Hugues, gained the victory ; and Raoul, duke of Bourgogne, was elected king in his room. Charles, having in vain sought assistance in several quarters, was beguiled by the promises of Heribert, or Herbert, count of Vermandois, who made himself master of his person, and placed him in confinement (923). His wife, sister of Athelstan, king of the Anglo-Saxons, took refuge in England with her son Louis, then a boy, but afterwards king under the title of Louis IV. Outremer. A quarrel between the Count of Vermandois and the King Raoul seemed to offer a gleam of hope to Charles, who was set at liberty by Herbert ; but the difference was soon made up, and Charles was remanded to confinement (928). Raoul treated his fallen rival with considerable kindness, paid him a visit, and bestowed upon him several presents. Charles died in captivity in 929, after a reign distinguished alike by incapacity and misfortune.

CHARLES IV., le Bel (the Handsome), third son of Philippe IV., le Bel, succeeded his brother, Philippe V., le Long, in 1322. He had received in the lifetime of his father the county of La Marche as an appanage. He had in the commencement of his late brother's reign vindicated the right of a female claimant to the throne, but that brother had succeeded in procuring from the states-general of the nation a declaration that females could not succeed to the crown of France ; and upon Philippe's death without male issue the principle thus recognised led to the undisputed succession of his brother Charles.

The reign of Charles was short (1322-28), and not marked by any great events. His first care was to divorce his wife Blanche, daughter of Otho, count of Bourgogne, who had been convicted of adultery, and shut up in prison. He procured a divorce, on the ground not of adultery, but on that of consanguinity, and married Marie of Luxembourg, daughter of the Emperor Henry VII. He proceeded to considerable severities against the financiers who had managed the revenues of the late king, causing the chief of them, Girard la Guete, to be put to the torture, of which he died. He also put to death Lille Jourdain, a noble of Languedoc, accused of murder and other crimes ; and is said to have used great severity towards unjust judges. He was engaged in war with Edward II. of England, who had married Isabella, sister of Charles. Isabella being sent to the court of France to compromise the quarrel, succeeded in that object, but obtained from Charles support both of money and men in the armament which she prepared against her husband, and his favourite, Le Despenser. Charles intrigued also with the pope in order to obtain the imperial crown, then disputed between Frederic of Austria and Louis of Bavaria ; and his gold led to the invasion of Germany by a horde of pagan barbarians, Lithuanians, Wallachians, and Russians. It was on occasion of a visit paid by Charles to Toulouse (1323), that the people of that city sought to revive the ancient Provencal poetry by the institution of a yearly concourse of poets at the Floral Games : this institution, with modifications, continued down to the revolution. Charles lost his wife and an infant son in 1324. Within three months he married a third wife, Jeanne, daughter of his uncle, the Count of Evreux ; but he had no male issue by her. He died in 1328 ; and in him ended the direct succession of the line of Capet, the crown passing into the collateral branch of Valois.

CHARLES V., le Sage, was the son of the unfortunate King Jean II., who was taken prisoner by Edward the Black Prince at

Poitiers in 1356. Charles, then duke of Normandie, was present during this battle, but he escaped by flight, of which he is said to have set the first example.

During the captivity of his father (1356-60), he seems to have held the reins of government as his lieutenant. At the commencement of his administration he was involved in disputes with the States-General, the appointed meeting of which was hastened by the disastrous result of the conflict of Poitiers. The spirit of liberty was rising in that assembly, and they presented remonstrances upon the misadministration of the government, respectful in their terms, though strong and pointed in their complaints. Robert le Cocq, bishop of Laon, and Etienne Marcel, provost of the merchants of Paris, were the leaders of the popular party in these struggles. The constitution of the French monarchy gave however to the court a resource which frequently baffled the opposition of the States-General. The kings applied to the States of the provinces into which that great kingdom had been all but dismembered: and from these smaller assemblies they experienced more deference than from the combined body, in which the spirit of freedom could display itself with more effect.

Charles, after dissolving the States-General, obtained a considerable grant from the States of Languedoc, assembled at Toulouse: and the example thus set was followed during the winter in many other provinces. But Charles was still pressed by pecuniary difficulties; and after resorting to a debasement of the coinage, without filling his exchequer, he was compelled again to summon the States-General. From this assembly he procured funds sufficient for the levy and maintenance of 30,000 men, but he had to purchase this aid by various concessions to the public spirit, perhaps also to the ambition of the representative body. A standing committee of thirty-six deputies represented, during the intervals between the meetings of the States, the popular party in that assembly, and maintained a continual struggle with the crown. Over this committee a temporary revulsion of public feeling enabled Charles to triumph; but upon the re-assembling of the States-General, the popular party regained the ascendancy, and Marcel, supported by the unprincipled Charles le Mauvais, king of Navarre, brother-in-law of the Duke of Normandie, proceeded to the most violent excesses. Strong in the support of the multitude, whom he instructed to wear hoods of red and blue, he burst into the presence of the duke, massacred two of his principal officers of state in his presence, while the rabble hunted down and murdered a third. Charles was compelled to wear the colours of Marcel, and assure the infuriated mob that he rejoiced in the destruction of traitors.

In the States-General the predominance of Marcel was increased by the retirement of many of the prelates and nobles, disgusted by the preponderance of the 'tiers état,' or commons. The States increased however the appearance of Charles's authority by requesting him, as he had now reached the age of twenty-one, to take the title of regent; and the provincial assemblies, in which the nobles predominated, so far supported him as to enable him to menace the 'bourgeois,' or citizens, of Paris, with blockade. He obtained too the alliance of the King of Navarre, who had been by Marcel's interest invested with the dignity of captain-general of Paris. Marcel's blind confidence in this traitorous prince proved his ruin. He had fortified the castle of the Louvre, and provisioned Paris for a siege; but arranged with Navarre for the surrender of the gate St. Antoine. Some of his fellow citizens, detecting the design and raising the populace, murdered Marcel, and several of his adherents, and threw their bodies into the Seine. The regent Charles soon occupied the capital, by the submission of the inhabitants, and avenged himself by numberless executions.

A dispute with the King of Navarre, whose wealth enabled him to assemble a powerful force of mercenaries, was the next trouble of Charles; and before this dispute was accommodated some of the finest parts of the Isle of France, Picardie, and Vermandois, had been overrun by the mercenaries. 'The free companies,' the name assumed by the soldiery who were disbanded during the existing truce between France and England, pillaged various parts of France without opposition; and a dreadful insurrection of the peasantry, who assumed the title of the 'Jacquerie,' added to the horrors of the time. [CAILLET, GUILLAUME.] The Jacquerie was supported by the bourgeois of Paris and other places, but the insurrection was completely put down. Negotiations for John's release were going on in the interval, but were defeated by the regent, who knew that his power would be brought to an end on his father's return, and by the King of Navarre, to whose plans the existing anarchy offered the greatest scope. At last, after a fresh invasion of France by the English, one of whose commanders, the brave Sir Walter Manny, shattered a lance against one of the barriers of Paris, where the regent was, the release of John was obtained by the treaty of Breigny (1360), and he returned to France and resumed the government.

Upon the death of John, in 1364, Charles resumed the reins of power, not now as lieutenant or regent during the absence of another, but as king in his own right; and though his conduct has been deemed by some to afford no proof of wisdom or energy, yet his measures seem to have been well chosen and well timed. He gained no distinction as a soldier, but in his reign France recovered in a great

degree from the disasters which preceded his accession. His surname, Le Sage (the Wise), has been supposed to be indicative of his attainments in literature, which were, for the age in which he lived, above mediocrity, rather than of his general capacity: but it seems to have been not inapplicable to his understanding also, for, if he were not wise in the higher acceptation of the word, he certainly possessed a considerable amount of shrewdness and cunning. The early part of Charles's reign was distinguished by another dispute with the ever faithless and unsettled King of Navarre; but the valour and conduct of Bertrand du Guesclin gave the superiority to the French. An accommodation with this prince, combined with the conclusion of the war for the succession of Bretagne, in which the English and French engaged as auxiliaries, and the opening afforded by the civil dissensions of Castile, and by other events, for the engagement of 'the free companies' in foreign parts, afforded some relief to France, and allowed Charles to contemplate the recovery of the advantages gained by the English in war, and confirmed to them by the treaty of Breigny.

By that treaty Aquitaine had been erected into a principality independent of the crown of France, in favour of the gallant Edward, so well known as the Black Prince. But Edward had disgusted his subjects by the imposts to which he subjected them, in order to supply his necessities; and some of his most important vassals, the Sire d'Albret and the Count d'Armagnac, had been won over to the French interest; and at length a general assembly of the Gascon barons appealed to Charles as suzerain—an appeal to which the latter readily responded, although the complete independence of Aquitaine had been established by the peace of Breigny. He summoned Edward, whom he knew to be languishing under the disease which finally wore him down to the grave, to appear before the Court of Peers at Paris. The indignant warrior replied to the summons, "that the commands of the King of France should be obeyed; but that when he attended his pleasure in Paris it should be with his helmet on his head, and with sixty thousand men in his train." A declaration of war was also sent over to England, and insultingly borne by one of Charles's household servants, instead of by a person of rank and importance equal to the occasion (1369). The reason assigned for this indignity was that the Black Prince had imprisoned (some say put to death) those who bore the French king's message to him. It was therefore thought unadvisable to risk the lives of persons of rank.

Charles had chosen the time for the rupture with judgment. Edward III. was getting in years; the Black Prince was languishing with disease; and of their best officers several had been removed by death. Sir John Chandos and Sir Walter Manny, the most distinguished of them, survived the recommencement of hostilities but a very short time, the first falling in battle, and the second dying soon after. Charles forbade his troops to engage in pitched battles, in which experience had shown their inferiority; but the system of warfare pursued enabled them to gain strength, while that of their opponents wasted away. The re-capture of Limoges, which had been surrendered to the French by the treachery of its bishop, was the last exploit of the Black Prince, who soon returned to England to linger and die; his subordinates and successors had neither ability nor influence; and the talents and energy of Du Guesclin and Clisson (two natives of Bretagne), and the alliance of Castile, gave the predominance to the French, and enabled them to conquer Bretagne, the duke of which took refuge in England. A well-equipped army of 30,000 men, under John of Gaunt, duke of Lancaster, marched indeed right across France from Calais to Bordeaux unopposed. Charles prudently kept his forces in walled towns, and allowed his enemies to waste their strength in struggling with destitution and famine amidst the desiles of Auvergne and Limousin, and of the 30,000 scarcely 6000 reached Bordeaux (1373). A truce for a year was afterwards concluded and prolonged, and negotiations were entered into. During the continuance of this truce occurred the deaths of the Black Prince (1376), and of his father, Edward III. (1377). Charles employed the interval in regulating the succession and the guardianship of his children, and in settling the establishments and portions of the younger branches of the royal family.

Before intelligence reached France of the death of Edward III., Charles had determined to renew hostilities, and the expiration of the truce enabled him to do so within a week after the English king had breathed his last. The English coast was insulted and ravaged by a combined French and Castilian fleet, and Charles's brother, the Duke of Anjou, made a prosperous campaign in Guienne (1377). But notwithstanding these advantages, the throne of Charles was surrounded with many increasing difficulties. He met with some success against the King of Navarre, whom he hated, and whom he now stripped of all his possessions in Normandy, except Cherbourg, which Navarre secured by an alliance with England; but the Castilians, whom he had engaged to attack the kingdom of Navarre itself, retreated upon the arrival of an English force at Bordeaux. The Duke of Anjou succeeded in suppressing some disturbances at Nîmes and Montpellier (1378-80) provoked by the rapacity of his government; but the severity with which he treated the latter city, and the general odiousness of his administration, rendered him so unpopular, that the king deemed it advisable to remove him. The exiled Duke of Bretagne returned from England, and the reviving affections of his people (whose estrangement from him had mainly contributed to the conquest

of the duchy by the French) enabled him to regain his dominions. The English assisted him in the enterprise; and a body of their troops marched unresisted from Calais to Bretagne (1380), Charles restraining by positive injunction the martial ardour of his brother, the Duke of Bourgogne, who with a superior body of forces hung upon their rear.

At this conjuncture Charles died at the age of forty-three, after a reign of more than sixteen years. He married Jeanne, daughter of the Duke of Bourbon, by whom he had nine children, of whom three survived him. His learning has already been adverted to: it may be added that the Royal Library at Paris owes its origin to him. Notwithstanding the wars he carried on, Charles left his exchequer well filled.

CHARLES VI., called *Le Bien-aimé* (the Well-beloved), son of the last-mentioned prince, came to the throne upon the death of his father in 1380, being yet in his minority. The guardianship of the king's person and the administration of his power became the subject of dispute between his uncles, Louis of Anjou, Jean of Berri, and Philippe of Bourgogne; the first-mentioned of whom had managed upon the death of Charles V. to possess himself of the crown-jewels and treasure, and of a deposit of the precious metals in bars, which that king had caused to be secretly built into the walls of his palace at Melun. The difference was terminated by an arrangement: Anjou was allowed to retain the valuables which he had purloined, and the king was declared to be of an age to assume the government, which was however really regulated by a council.

The beginning of Charles's reign was marked by intestine commotions. The Duke of Berri, governor of Languedoc, goaded the people of that province into rebellion by exactions as galling as those of his brother and predecessor Louis of Anjou. These troubles were not immediately extinguished either by the powerful force or dreadful severity of the duke, although he succeeded in repressing open insurrection; for the peasantry took refuge in the woods, and waged against those of higher station a war as much marked by un pitying atrocity as that of the *Jaquerie*. [CHARLES V.] An attempt to establish a market-toll led to serious commotions both at Rouen and at Paris; the commotions were suppressed, and were followed by numerous executions, open and secret, in both cities.

Troubles in Flanders, where the wealthy inhabitants of the great manufacturing towns were engaged in perpetual broils with their feudal lords, next engaged the attention of the young king. The Flemings had rebelled against Count Louis, father-in-law of the Duke of Bourgogne; and the king marched to the support of the count with a completely-appointed army, and defeated Philippe von Arteveld, leader of the Flemings, in the great battle of Roebecque, with dreadful slaughter (1382). Courtray was plundered, and Bruges and Tournay came into the hands of the French; but Ghent and other places held out, and the approach of winter compelled the king to disband his army. Upon his return to Paris, Charles punished severely some tumults which the citizens had raised during his absence, and similar measures of coercion were adopted at Rouen, Châlons-sur-Marne, Reims, Sens, and Orléans. A campaign, the following year, against the Flemings, who were supported by a body of English under Henry le Spenser, the warlike bishop of Norwich, was on the whole successful, though not marked by any brilliant exploit. This war partook of the nature of a religious war, for it was the time of the great schism in the papacy, and the English and Flemings supported Urban VI., one of the claimants, while the French supported Clement VII., his rival. The troubles of Flanders were composed by a treaty (1384), during the negotiation of which the Count of Flanders died, stabbed, according to some accounts, by the Duke of Berri, the king's uncle.

The year 1385 was distinguished by the marriage of Charles with Isabelle, daughter of the Duke of Bavaria-Ingolstadt, as well as by a renewal of the troubles in Flanders; and the following year (1386) by the assemblage of a vast force for the invasion of England. This force amounted, according to Froissart, to 20,000 men-at-arms, 20,000 crossbowmen, partly Genoese, and 20,000 'stout varlets.' Other accounts enlarge the number to 600,000 fighting men. A fleet almost innumerable, 1287 vessels according to some, was collected on the coast of Flanders from all parts of Europe, from the Baltic to the extremity of Spain; and an enormous wooden bulwark was constructed, capable of sheltering, it was said, the whole army from the dreaded archery of England: it could be taken to pieces and replaced at pleasure. But various delays, whether from contrary winds or other causes, prevented the sailing of the fleet, or a tempest so far shattered it as to frustrate its object; and the king, who was to embark in person, returned to Paris, after exhausting his resources in the equipment of such a force, and desolating by the consequences of its march the face of the country which he traversed. The project of invasion was resumed next year, with preparations of a far less costly nature; but this expedition was set aside by the captivity of the Constable de Clisson, who was treacherously seized by his mortal enemy De Montfort, duke of Bretagne, who was jealous of De Clisson's proposed alliance with the house of Blois, which had disputed the succession of Bretagne with De Montfort. De Clisson was released, but upon hard conditions; and his hostility was probably diverted from England to Bretagne. In the year 1388 Charles undertook an expedition against the Duke of Guelders, but he could obtain only a qualified submission; and the

BIOG. DIV. VOL. II.

result of the expedition was, considering his superior force, regarded as inglorious. The public murmured, and it is likely their murmurs were chiefly directed against the king's uncles, the dukes of Berri and Bourgogne, for the king took the opportunity to emancipate himself from the tutelage in which he had been held by these royal dukes. The cardinal of Laon, who had acted a prominent part in bringing about this change, was taken off by poison: the immediate author of his death was detected, but the probable instigators of the crime were too lofty for punishment.

A variety of events of greater or less importance, such as an unsuccessful expedition of the French to Tunis, under the Duke of Bourbon, the king's maternal uncle; a projected expedition against Tunis, and subsequently against Rome, by Charles himself; an unsuccessful attack on the Viscount of Milan by the Count of Armagnac; a vain negotiation for peace with England, which issued only in the prolongation of the existing truce; and an illness of the king, the precursor, it is likely, of his subsequent malady, occupied the succeeding period to the spring of the year 1392. In that year an attempt was made to assassinate De Clisson, and the Duke of Bretagne, if he did not instigate the crime, protected the criminal. This determined Charles to march against him; and it was in this march that the insanity manifested itself, which rendered Charles for the rest of his reign a mere tool in the hands of others. He had indeed brief lucid intervals, and there seemed, on one occasion, a prospect of recovery, when an accident at a masquerade, in 1393, by which he was nearly burnt to death, occasioned a relapse.

The period which succeeded the king's insanity was mainly occupied in a struggle for that power which he was no longer able to wield, between the Duke of Orléans, his brother, and the Duke of Bourgogne, the most energetic and ambitious of his uncles. The latter established a preponderant authority, though not without many fluctuations. He chased from court and despoiled of his office the Constable de Clisson, who retired to his estates in Bretagne, and carried on hostilities against his old enemy, the duke of that province, until 1395, when a treaty terminated their difference. By an edict issued in 1394 the Jews were banished from France: this edict continued unrepealed for centuries. The year 1396 was marked by the marriage of Richard II. of England with the daughter of Charles; but the deposition of the bridegroom, two or three years afterwards, and the tender age of the bride, rendered it only a marriage in form. The same year was marked by the unfortunate expedition of the Count of Nevers against the Turks, and by the submission of Genoa to France. The Genoese however shook off the French yoke in 1409. The hatred which the Duke of Bourgogne entertained against the Duke of Orléans was marked by his encouraging the popular belief that the Duchess of Orléans had caused the king's disease by magic, and by his supporting the Genoese against the Viscount of Milan, the father of the duchess. Upon the death of the Duke of Bourgogne in 1404, his power, and his rivalry, descended to his son, more ambitious and unscrupulous than his father.

The death of the Duke of Bourgogne threw the reins of government for a time into the hands of the Duke of Orléans, to whom public opinion imputed too great intimacy with the queen, and whose luxury and thoughtlessness exhausted the revenues of the crown, while his manifestations of hostility against Henry IV. of England would have led probably to a renewal of the war, had not Henry's attention been fully taken up in securing his usurped throne. It is to be observed that the hostilities between the two nations had been suspended by a succession of truces rather than closed by a definitive treaty. The Duke of Bourgogne, who was regarded by the commonalty, especially of Paris, as the champion of their liberties, having acquired, in 1405, possession of the persons of the king and the dauphin Louis, began to gain the ascendancy over Orléans; a reconciliation, cordial in appearance, was effected, but their hatred continued to rankle, until it was revealed by the murder of the latter by the former, in 1407.

We pass over the subsequent struggles between the factions of the Bourguignons and the Armagnacs, as the rival party was designated, the warfare and massacres to which they led, and the negotiations of the Armagnacs with the King of England, in order to come to the invasion of France by Henry V. of England, who had lately succeeded his father Henry IV. on the throne. Henry V. had negotiated for the hand of Catherine, daughter of Charles, and demanded as her portion the arrears of the ransom of King John, and all the provinces which had been ceded to the English by the treaty of Bretigny; while Charles was not willing to give more than 800,000 crowns, and the duchy or principality of Aquitaine, as it had been possessed by Edward the Black Prince; refusing to give up the other territories which by that treaty had been ceded to England. A rupture was evidently impending, and the domestic troubles of France were increased by the dauphin, who at this conjuncture seized the reins of government, and alienated the leaders of both the contending factions. The Armagnacs however rallied round him for the defence of their country against foreign invasion, and to their party belonged the long list of nobles and gentlemen who fell in the disastrous battle of Agincourt (1415). The dauphin died shortly after this, and was survived little more than a year by his next brother, Jean, to whom the title devolved: on the death of Jean it came to a still younger brother, Charles, afterwards Charles VII. The Armagnac faction now predominated, and the

predominance was exercised with remorseless oppressiveness by the Count of Armagnac, constable of France. His measures stimulated the Parisians to support the Duke of Burgogne, who was also aided by the Queen Isabella of Bavaria, whom for her licentiousness the Armagnacs had exiled to Tours: the Bourguignons consequently surprised the capital, the droge of the populace rose and ferociously murdered Armagnacs and his partisans, including many bishops and persons of rank, and many of inferior degree. The king fell into their hands, and the young dauphin was rescued only by the vigour and activity of Tannegui du Châtel (1418). The dauphin established his court at Poitiers; and the Bourguignons retained Paris; while Normandy was overrun, and its capital, Rouen, taken by Henry V. (1419). The subsequent assassination of the Duke of Burgogne at Montreuil threw his party into the arms of the English, and led to the treaty of Troyes, by which the administration of France was placed in the hands of Henry V., and his accession to the throne, upon the death of Charles, was stipulated. He married the Princess Catherine, and prosecuted the war vigorously and successfully against the dauphin, who was driven to take refuge in the southern provinces. During the absence of Henry in England, an English army, under the Duke of Clarence, was defeated at Baugé, but on Henry's return the English regained their superiority, and held it till their king's death, 31st of August 1422. Charles survived him only a few weeks, dying on the 21st of October in the same year, after a long and disastrous reign of forty-two years.

CHARLES VII., le Victorieux (the Victorious), son of Charles VI., succeeded, upon his father's death (October 1422) to a kingdom, the greater part of which was possessed by enemies, foreign or domestic. He celebrated his coronation at Poitiers in 1423, and summoned an assembly of the States-General at Bourges. The commencement of his reign was disastrous; his troops, of whom Scottish auxiliaries formed a considerable portion, were defeated at Crevant and Verneuil, while his court was stained with the blood of two of his favourites, successively victims to the jealousy of the constable Arthur of Richemont, a branch of the ducal family of Bretagne.

In 1435 a body of English forces, under the most renowned of their officers, besieged Orléans, which was defended by Dunois, a bastard of the family of Orléans, Xaintrailles, and other distinguished Frenchmen. The siege was vigorously pressed, and Charles manifested little of the energy which the state of his affairs required. The deliverance of Orléans and the revival of the spirit of the French may be ascribed mainly to Jeanne d'Arc [ARG, JEANNE D'], whose extraordinary character and claims to supernatural influence impressed both parties and turned the tide of fortune. Charles carried on the war by his generals, seldom exposing his person in the field, a caution which the death or captivity of nearly all the members of his family, and the evils that would have resulted from any accident to him, seem fully to justify. Success attended his arms; the English power declined; and the treaty of Arras, by which Charles was reconciled to the Duke of Burgogne, and the death of the able Duke of Bedford (regent for his nephew Henry VI. of England) [BEDFORD, DUKE OF], both which events occurred in the year 1435, rendered the superiority of the French arms decisive. Paris opened its gates to the French in 1436. Normandy was reconquered in 1450, and the final subjugation of Guienne was secured by the battle of Castillon in 1453, and the English possessions were reduced to Calais and the surrounding territory. It was during the course of the war [1428] that Charles was crowned (for a second time) at Reims. The condition of France, during the continuance of hostilities, was most wretched, not that the war was carried on by the two great powers with energy and vigour, but that the provinces were ravaged by bands of armed marauders, while famine and pestilence wasted Paris and the adjacent provinces shortly after the expulsion of the English from the capital in 1436: nearly 50,000 persons are said to have died in Paris alone.

While engaged in struggling with the English, Charles distinguished himself by two measures, which may be considered as the most beneficial of his reign. The first of these was the issuing of that ordinance, known in history by the title of the 'Pragmatic Sanction,' which is regarded as having laid the foundation of the liberties of the Gallican church. This ordinance recognised the superiority of monarchical or general councils over the popes; and denied to the pontiffs, with a few exceptions, the appointment of bishops, who were to be elected by their respective chapters subject to the royal approval: it prevented the interference of the Romish see in the disposal of inferior benefices, and abolished the abuse of 'expectations' or promises in reversion while the incumbents were yet living. It contained several other regulations tending to curtail the revenue or the authority of the papal court. The other great measure of Charles was the reform of the army. The irregular bands which had constituted the military force of the kingdom, served at pleasure and on their own terms, and by their lawless ravages became the scourge of the country which they professed to defend. By firmness and wisdom the king converted these marauding detachments into a well-disciplined standing army, and however the change may have subsequently tended to consolidate the royal power and extinguish political freedom, it can hardly be considered as other than a benefit at the time it was made [1440]. The provinces were delivered from military licence, and the army, though reduced perhaps in numbers, increased in efficiency. It was not with-

out considerable opposition that Charles effected his purpose: the great military leaders formed a cabal, which assumed the name of 'Praguerie' (from the popular commotions which had agitated Bohemia in the time of Husa), and the dauphin, a youth of seventeen (afterwards Louis XI.), joined the malecontents. But the king was supported by the bulk of the nation, and by his firmness carried his point. For the wild and untameable spirits among the common soldiers, a suitable outlet was found in two expeditions, one under the dauphin (who had been brought back to his duty) against the Swiss and in support of Frederick III. of Austria; another, under the king himself, against Metz, one of the free cities of Lorraine, which René of Anjou, duke of Lorraine, wished to incorporate with his duchy.

Though the success of Charles's arms seems to give justice to his title of 'the Victorious,' and under his government the kingdom was raised from the lowest point of depression to a respectable and flourishing state, yet in his court and in his family this monarch was far from happy. In his early youth he was the object of his insane father's caprice, and of the hatred of his licentious mother, who had allied herself to the Bourguignon faction. His wife, Marie of Anjou, was indeed the faithful and affectionate companion of his early distress, notwithstanding the just cause of jealousy which he gave her; and her spirit is said to have roused him from the indolence and depression in which he was disposed to sink when the predominance of the English was in its zenith. Tradition has transferred to another part which she thus performed:—Agnes Sorel, the mistress of Charles, has been mentioned as the encourager of the king when he was faint-hearted, but her influence was of later date than the period of Charles's greatest depression (Note Z in Hallam's 'Middle Ages,' vol. i. chap. 1. part II.): she died in 1450, and all contemporaries agree in commendation of her loveliness and her intellectual powers. The artfulness and malignity which the dauphin (Charles's eldest son) manifested when he became king [Louis XI.], are sufficient to account for the jealousy with which his father from an early period regarded him. The connection of this prince with the 'Praguerie' has been already noticed; his subsequent disputes with his father increased to such a degree that he fled to the territories of the Duke of Burgogne, by whom he was sheltered, and who was consequently involved in disputes with Charles, who desired his son's return. As to the court of Charles, the first person who exercised predominant influence there was Tannegui du Châtel, the prime agent in the murder of Jean Sans Peur, duke of Burgogne (1419); but when Arthur of Bretagne, count of Richemont, became constable of France, he perceived that the removal of Tannegui was necessary in order to open the way for a reconciliation with the Bourguignons, of the desirableness of which he was early sensible. Tannegui was consequently sent into honourable exile from the court as seneschal of Beaucaire, in 1424. The violence of Richemont, a blunt rough soldier, involved him in disputes with the minions of the court, and two of them were hastily and arbitrarily executed by his procuration; a third, La Trémouille, more artful, maintained his post, and the court became divided into two factions—that of La Trémouille and that of Richemont; ultimately however the constable prevailed. At a later period, Antony of Chabannes, lord of Dammartin, became predominant. He had caused, in 1453, the ruin, by false accusation, of Jacques Cour, a merchant and banker of Bourges, whose extensive business and great wealth had enabled him to afford Charles most important aid in financial affairs; and it was from jealousy or fear of Dammartin that the Dauphin Louis fled to Burgogne. Dammartin seems to have retained his influence until the death of Charles, which took place from a singular cause. He appears to have inherited from his father a taint of insanity, and the latter end of his life was embittered by monomania, manifesting itself in the apprehension that his children had conspired to poison him. Under this apprehension he refused food for seven days, and died of exhaustion at Mehun-sur-Yèvre, near Bourges, on the 22nd of July 1461.

It was in the reign of this prince that the Greek language was first taught in the University of Paris. That university is said to have contained at this time 25,000 students.

CHARLES VIII., son of Louis XI., succeeded to the throne upon the death of his father in 1483, being little more than thirteen years old. His father had failed to appoint any regency, and the guardianship of the king and the kingdom became consequently an object of ambition to those whose proximity in blood to the crown authorised them in aspiring to such an elevation. The dignity of president of the council of state was bestowed on the Duke of Orléans, next heir to the throne; but the guardianship of the king's person, together with the real power of the government, was bestowed upon Anne of France, lady of Beaujeu, the king's eldest sister, at that time about twenty-two years of age.

The minority of Charles was troubled by the disturbances raised by the ambitious nobles, impatient of the predominance of the lady of Beaujeu. In 1485 the Duke of Orléans and the Count Dunois, son of the famous Count Dunois who had defended Orléans against the English [CHARLES VII.], raised the standard of rebellion, but submitted on the king's approach; their discontent however continued, and Orléans retired into Bretagne, the duke of which province afforded him protection, and united with Maximilian, king of the Romans, in intrigues against France. In 1485-86 Dunois, with the Count of Angoulême, attempted an insurrection in Guienne, but was forced to

submit; and after this success the king marched into Picardie to oppose Maximilian. The following year the war continued on the side of Picardie, and the king ordered the invasion of Bretagne by a considerable force. The invasion was renewed in 1488, when the French commander, Louis de la Trémoille, or Tremouille, one of the first generals of his day, gained a complete victory over the troops of Bretagne, and of the insurgent lords and their allies at St. Aubin de Cormier. The Duke of Orléans, the Prince of Orange, and other persons of note were taken; and La Trémoille executed without delay such of his prisoners as were of rank, except the duke and prince, who were kept in close imprisonment. The submission of the Duke of Bretagne, which resulted from the defeat of his troops at St. Aubin de Cormier, was speedily followed by his death; and the hand of Anne, his daughter and heiress, was eagerly sought by several suitors. Of these, Maximilian, king of the Romans, obtained the preference, and a marriage by proxy took place, probably in 1500; but before the arrival of Maximilian, who delayed above a year, the match was broken off, and the young duchess was united in a firmer union to the King of France. This marriage was preceded by an unexpected revolution at the court of France: Charles, now in his twenty-first year, freed himself from the guardianship of his sister, released the Duke of Orléans, and broke off his engagement with a daughter of Maximilian, to whom he had been betrothed, and who had been sent for her education to the court of France. These events led to a war with Maximilian, who was supported by Henry VII. of England, and by Ferdinand and Isabella of Spain; but the French averted the hostility of Henry, who had commenced the siege of Boulogne, by a payment of money, and of Ferdinand by the cession of Roussillon and Cerdagne. Maximilian also agreed to terms; the counties of Bourgogne (Franche Comté) and Charolois were ceded to him; and the treaty of Senlis (1493), by delivering Charles from the pressure of hostilities at home, enabled him to turn his thoughts to the prospect opening to his ambition at the extremity of Italy.

The house of Anjou, a younger branch of the royal family of France, had claimed and contested the crown of Naples with a branch of the royal house of Aragon, which latter had obtained possession. The right of the house of Anjou had been purchased by Louis XI. and transmitted to Charles VIII.; and this prince, instigated by Ludovico Sforza, surnamed Le More (usurper of the government of Milan under the guise of being regent for his imbecile nephew, Giovanni Galeazzo), determined to support his claim to the kingdom of Naples by force of arms. In 1494 he set out for Italy, at the head of an army of 8600 men-at-arms, 20,000 native infantry, 8000 Swiss mercenaries, and a formidable train of artillery. In his advance he experienced little resistance, and, in despite of the advice of his most sagacious counsellors, who recommended him to make himself master of the Milanese and of Genoa, he pushed on towards Naples. Excepting Sforza, none of the Italian potentates seem to have supported him: Pietro de' Medici, who governed Florence, opposed him, as also Pope Alexander VI. Charles however entered Florence and Rome, where he made a treaty with the pope, and early in 1495 he set out from Rome for Naples. He entered this city also without a struggle, the King of Naples having quitted it three days before his arrival. At his entry he wore the insignia of the Eastern Empire, having purchased the rights of Andrew Palæologus, nephew of the last of the eastern emperors, Constantine Palæologus; for his ambitious views extended from the possession of Naples to that of Constantinople, and from that again to the redemption of the Holy Sepulchre.

While Charles was staying at Naples a league was formed between the pope, the emperor, Ferdinand of Spain, the republic of Venice, and the treacherous Sforza, to intercept him on his return. The Neapolitans, who had at first welcomed the French, began to grow disgusted with them, especially the nobles, who saw themselves excluded from the great offices of state. Charles determined to return with his army, which, after deducting the force left at Naples, was reduced to about 9000 men. The confederates awaited him with a far superior force (approaching 40,000 men), near Fornovo, not far from the foot of the Apennines, about ten miles from Piacenza. The French were victorious; but the victory obtained for them little more than a secure retreat, and the deliverance of the Duke of Orléans, who was besieged in Novara. Naples was recovered by the great captain Gonsalvo of Cordova, a Spanish general, who forced the French under the Duke of Montpensier to an accommodation, and enabled the King of Naples to re-enter his capital three months after he was driven from it. Charles meditated a second expedition into Italy, and the Duke of Orléans, who had claims on the Milanese, was appointed to the command; but the duke was not anxious to be distant from the court, and the influence of the party opposed to the expedition, and the want of money, retarded the preparations, and the affair was not pressed with any activity. Charles had three sons by his queen, Anne of Bretagne, but all had died; and Orléans was still next heir to the throne, the prospect of ascending which was brought nearer by the declining health of the king. The short remainder of Charles's reign was occupied in attention to the internal government of the country, in which some useful reforms were commenced. He died in 1498, of the effects of a blow on the head, received while passing through a door-way which was not high enough.

CHARLES IX. was the second son of Henri II., and succeeded to

the throne on the death of his elder brother Francis II. in 1560, being then in his eleventh year. The government during his minority was administered by his mother Catherine de' Medici, while Anthony of Bourbon, king of Navarre, had the title of lieutenant-general of the kingdom. The release of the Prince of Condé, brother of the King of Navarre, who had been imprisoned during the preceding reign, was one of the first acts of the new government; the prince had been looked up to as the leader of the Reformed or Huguenot party, to which the King of Navarre now also joined himself. Alarmed at the growing strength of the Calvinists, the Constable Montmorenci and the Duke of Guise, previously rivals and enemies, were reconciled, and formed, with the Marshal St. André, a union to which the Huguenots gave the name of the *Triumvirate*. Thus early in the king's reign did the parties seek to strengthen themselves, whose animosity and struggles deluged France with blood. A project suggested by the King of Navarre for the resumption by the crown of all the grants of the last two reigns, in which the members of the triumvirate had largely shared, had probably considerable influence in the formation of this union.

An edict prohibiting the public preaching of the reformed religion on pain of exile having been issued in 1561, the Huguenots refused obedience, and took up arms in defence of their liberty. Their chiefs demanded a public conference with the Catholics; and the demand led to the celebrated 'colloquy of Poissy,' in which Theodore Beza defended the cause of the reformed, and the Cardinal of Lorraine that of the Catholic church, before the king, the princes of the blood, and a number of nobles and dignified ecclesiastics. The disputants remained, as might be supposed, unconverted; but the conference served the King of Navarre as a pretext for abandoning the party of the reformed, and reconciling himself with the Guises. A promise of the restoration of Navarre proper, which had been conquered by Spain, was probably the lure that drew him over. But it was not by words that the differences of the parties were to be decided: disturbances arose in the provinces; and the Queen Mother, jealous of the union of Navarre with the Guises, by which her own influence was diminished, sought to win the support of the Huguenots, by procuring an edict to be issued allowing them the exercise of their religion out of the towns. The peace thus established was of short continuance; a quarrel between some domestics of the Duke of Guise, and a congregation of Protestants at Vassy in Champagne, led to the massacre of the latter, and became the signal for hostility. The Protestants possessed the predominance in the south and west of France; they held Orléans, Blois, Tours, Angers, La Rochelle, Poitiers, Rouen, Havre-de-Grace, and Dieppe; and they were supported by Elizabeth of England, and the Protestants of Germany. The Catholics had for them the king and the court, the regular army, the capital, the provinces of the north and east, the talent of the Guises, and the support of Philip II. of Spain. The first important event was the siege and capture of Rouen in 1562 by the Catholics, who lost their general, the king of Navarre, mortally wounded during the siege. The Prince of Condé, and the Admiral Coligni, with the Protestant army, threatened the capital; but being obliged to withdraw, were overtaken at Dreux, where they were defeated, and the prince was made prisoner. The Protestants had however early in the action captured the Constable Montmorenci, commander of the Catholics, and the constable and the prince were soon after exchanged. The Marshal St. André, another member of the triumvirate, fell in this battle.

The following year (1563) was marked by the siege of Orléans, and the assassination of the Duke of Guise, commander of the besieging army, by Poltrot, a Protestant. The removal of the duke probably prepared the way for peace, which was concluded not long after his death. Havre, which had been placed by the Huguenots in the hands of the English, was taken from them in July of this year by a French army under the Constable: and peace with England was subsequently made. In 1564 the king by an edict revoked some of the advantages which had been conceded to the Huguenots at the peace concluded the foregoing year, and disgusted the Prince of Condé, by refusing to fulfil a promise that he should be made lieutenant-general of the kingdom in the place of his late brother, the King of Navarre. The court, strong in the support of an army, which had been raised to guard the frontier from any violation consequent upon the revolt of the Netherlands against Spain, excited the jealousy of the Protestant leaders; and Condé and Coligni attempted, in 1567, to carry off the king. This led to the second religious war, in which Catherine de' Medici was decidedly hostile to the Huguenots, whom previously she had been inclined to favour.

The battle of St. Denis, in which the Constable Montmorenci was killed (1567), led to no decisive result. Peace was made in 1568, but it was soon after broken: neither party had confidence in the other; and the king issued a decree declaring that he would have only one religion in France, and ordering all the ministers of the reformed party to leave the kingdom. The battle of Jarnac in Angoumois was fought in 1569, and the Protestants lost both the victory and their leader the Prince of Condé, who was taken and shot in cold blood after the battle by Montesquieu, captain of the Guards to the king's brother, the Duke of Anjou, who commanded the Catholic army. Henri of Bourbon, prince of Béarn, afterwards Henri IV. was now recognised

as head of the Protestant party, but he was yet only a youth of sixteen, and the command remained in the hands of Coligny. The king was jealous of the rising reputation of his brother; the Protestants were reinforced from Germany, and gained an advantage at La Roche Aبايلة in Limousin; however the vain attempt upon Poitiers, and a second bloody defeat which they sustained from the Duke of Anjou at Montcontour in Poitou in 1569, would perhaps have been fatal to their party but for the revolution of Coligny, and the reviving jealousy of the king towards his brother. Peace was soon afterwards (1570) made on terms more favourable to the Huguenots than the events of the war would lead us to expect. An amnesty was granted to them, and liberty of conscience; their worship was allowed in all places held by them during the war, and at any rate in two towns of each province; and four strong places, Rochelle, Montauban, Cognac, and La Charité, were to be garrisoned by them as securities for the faithful performance of the treaty. In the same year Charles married Elizabeth, daughter of the Emperor Maximilian II.

For the massacre of St. Bartholomew we refer below. This dreadful event, if it for a moment paralysed the Protestants, roused them, after the first astonishment had passed away, to resistance and vengeance. They held Rochelle, which the royal forces besieged in vain; the massacre had alienated many of the Catholics from the court, and led to the formation of a middle party, called *Les Politiques*, headed by the family of Montmorency. The Protestant courts and nations, and many even of the Catholic, recoiled with horror and loathing from the perpetrators of so foul a deed. Charles felt that he had covered himself with eternal infamy. Conscience-stricken at the part he had taken in the massacre, he granted peace to the Huguenots. The short remainder of his reign was troubled by the contests of parties at the court, by plots and rumours of plots. Charles died May 30, 1574, having lived nearly twenty-four years, and reigned thirteen years and a half.

THE MASSACRE OF ST. BARTHOLOMEW is so important an event in connection with the life of Charles IX., and with the history of France, that we append here a separate account of it, and the circumstances which led to its perpetration. It is called the 'Bartholomew Massacre,' or simply 'the Bartholomew,' because it occurred on the 24th of August, St. Bartholomew's day. 'Huguenot' was the name by which the French Protestants are invariably designated by contemporary writers. There has been much discussion as to the origin of the term. According to some, it comes from a German word used in Switzerland, which signifies sworn ('eidgenoes'), or bound by oath. Others, with Castelnau, who lived at the time it first came into use, tell us that it was an epithet of contempt, derived from a very small coin inferior even to the mailles, the smallest coin then in use in France, which had been in circulation since Hugo Capet.

As the Bartholomew massacre is one of the most contested passages in history, and as there is no historical question upon which it is more difficult to form an opinion not open to objections, it will be convenient to divide this article into two portions: 1st, a simple narrative of the transactions; 2nd, a brief summary of the opinions of historians with reference to the probable motives of those who planned and executed it.

§ 1. The progress of the reformation in France was different from what it was in England, where, being the act of the civil magistrate, it was conducted with more moderation; in France, on the contrary, the ruling powers were strongly opposed to it, and its progress was wholly owing to the zeal and courage of individuals. In England there was a sort of compromise with the feelings and opinions of the adherents of the ancient faith; while in France a Protestant meant not merely one who shook off the papal authority, but one who denounced the pope as anti-Christ, and the ceremonies of the Romish Church as the worship of Belial. In their tenets and political condition the Huguenots closely resembled the English puritans of the 17th century. Like them, discountenanced and at length persecuted by the court, the French Huguenots became a distinct people in their native country, abhorring and abhorred by their Catholic fellow-subjects; united to each other by the closest ties of religion and a common temporal interest, and submitting solely and implicitly, in peace and in war, to the guidance of their own leaders. The wars between these irreconcilable parties were, as might be expected, frequent and bloody.

In August 1570 a treaty of peace was concluded between the French king, Charles IX., and his Huguenot subjects. This was the third contract of the kind that had been entered into between these parties within eight years. The two first were shamefully violated as it suited the purpose of the stronger party. It was natural therefore that the Protestant leaders should feel very distrustful as to the motives of the Court with regard to the new act of pacification; and this distrust was far from being lessened by the circumstance that the overtures to peace proceeded from the Court, and that the terms of the treaty were unusually favourable to the Huguenots. The veteran Coligny (see COLIGNY), admiral of France, however lent all the influence of his authority, as the leader of the Huguenots, towards promoting the avowed object of the treaty. He was earnestly pressed to court; but suspicious of the queen-mother, the celebrated Catherine de' Medici, and of the party of the Duke of Guise, he refused the invitation, and retired to the strong Huguenot fortress of Rochelle. He was accompanied by the young Prince of Navarre (afterwards

Henri IV.), Condé, and other chiefs of the Protestant party. This distrust, however, of the admiral, was entirely effaced before the end of the second year from the date of the treaty. Charles IX. was but twenty years of age when he ostentatiously sought to be reconciled with his Huguenot subjects. The peace was emphatically called his own peace, and he boasted that he had made it in opposition to his mother and other counsellors, saying, that he was tired of civil dissensions, and convinced, from experience, of the impossibility of reducing all his subjects to the same religion. His extreme youth—his impetuous and open temper—and, if we may believe Walsingham, who was the English ambassador at Paris at the time, the unsettled state of his religious opinions, inclining "to those of the new religion,"—naturally operated in removing the distrust of Coligny. Contrary to what had happened after former treaties, pains were taken to observe the articles of pacification, and to punish those who infringed them. Charles spoke of the admiral in terms of praise and admiration; the complaints of the Huguenots were listened to with attention, and their reasonable requests granted; and their friends were in favour, while their enemies were in apparent disgrace at court. Early in 1571 Charles offered his sister in marriage to the Prince of Navarre, the acknowledged head of the Huguenot party; and though the pope refused to grant a dispensation for the marriage, and the Spanish Court and the Guises strongly opposed it, he persisted in bringing it about, threatening the papal nuncio that he would have the ceremony performed without a dispensation, if the pope continued obstinate in withholding it. He enlisted the personal ambition of the admiral on his side, by offering to send an army, under his command, into Flanders, to co-operate with the Prince of Orange against the King of Spain.

Charles again, in the summer of 1571, earnestly solicited the admiral to repair to court. The letter of invitation, written with his own hand, was entrusted to Teligny, the admiral's son-in-law. It was backed by warm solicitations from Montmorency, the admiral's near relation, and the Marshal de Cosse, his intimate friend. Coligny's apprehensions at length gave way, and in September of the same year he repaired to Blois, where Charles held his court. His reception was apparently the most cordial and respectful: he was restored to all his honours and dignities, and loaded with presents. The king called him "Father," and in a tone of affection added, "We have you at last, and you shall not escape us."

This apparent favour of the king towards the admiral continued without interruption for many months. When absent from court, Charles maintained a correspondence with him by letters; and in their private conversation he at least affected to unbosom himself without reserve to his new friend; cautioned him against his mother and her Italian favourites, spoke disparagingly of his brother Anjou, and in giving the character of his marshals, freely described their faults and censured their vices. Coligny was completely won by this frank demeanour of the young king, and employed his influence to induce the other Huguenot chiefs to repair to court. Though repeatedly warned of his danger his confidence was unshaken. "Rather," said he, "than renew the horrors of civil war, I would be dragged a corpse through the streets of Paris."

The marriage of Henry of Navarre with Margaret, the king's sister, was celebrated with great pomp on Monday the 18th of August 1572. Most of the Protestant nobility and gentry, with the admiral at their head, attended on the occasion; and as their prejudices would not let them enter a church where mass was celebrated, the ceremony was performed in a temporary building near the cathedral of Notre Dame. The Tuesday, Wednesday, and Thursday were passed in all sorts of festivities. On Friday the 22nd, Coligny attended a council at the Louvre, and went afterwards with the king to the tennis-court, where Charles and the Duke of Guise played a game against two Huguenot gentlemen. As he walked slowly home, reading a paper, an arquebuss was discharged at him from the upper window of a house occupied by a dependant of the Duke of Guise. One ball shattered his hand, another lodged in his right arm. The king was still playing at tennis with the Duke of Guise when the news of this attack reached him. He threw down his racket—exclaiming "Shall I never have peace?" and retired apparently dejected to his apartment. He joined the King of Navarre and the Prince of Condé in their lamentations, and promised, with threats of vengeance, to punish the guilty.

The admiral's wounds were declared on the 23rd not to be dangerous. He expressed a wish to see the king. Charles visited the wounded man, accompanied by his mother and a train of courtiers. Coligny requested to speak with the king alone, and Charles commanded his mother and brother to remain at a distance. Catherine afterwards acknowledged that these were the most painful moments she ever experienced. "Her consciousness of guilt, the interest with which Charles listened to the admiral, the crowds of armed men in constant motion through the house, their looks and whispers and gestures, all conspired to fill her with terror. Unable to remain any longer in such a situation, she interrupted the conference, by pretending that silence and repose were necessary for the recovery of the admiral. During her return in the same carriage with the king, she employed every artifice to draw from him the particulars of the conversation. He disclosed sufficient to add to her alarm." This passage, which we have extracted from Lingard's history, is confirmed in the main by the

narrative of the St. Bartholomew, attributed to the Duke of Anjou, afterwards Henri III., who had a large share in its design and execution. He tells us that as the admiral began to speak earnestly, Catherine came up and drew the king away, but not till she had heard the admiral advise him not to let his mother and brother have so much of his authority.

On the first news of the admiral's wound the Huguenots repaired in crowds to his residence, and offered their services, with menacing language against the Guises—the suspected assassins. A royal guard was placed to protect the house of Coligny from popular violence; and under a similar pretext of regard for his safety, the Catholics were ordered to evacuate and the Protestants to occupy the quarter in which he resided.

The attempt at assassination was not the work of the Guises: it was planned by the Duke of Anjou, the Duchess of Nemours, and the queen-mother. The father of the Duke of Guise, and first husband of the Duchess of Nemours, was assassinated by a Huguenot fanatic, who alleged that he committed the crime under the sanction of the admiral; and since that event Coligny always felt that his life was in danger from one who, whether justly or unjustly, regarded him as the murderer of his father. The attempt at assassination having failed, the conspirators met on the morning of Saturday the 23rd, in secret conference. Baffled revenge and the dread of vindictive retaliation augmented the ferocity of their counsels. On Saturday after dinner, the hour for which at that time was noon, the queen-mother was seen to enter the king's chamber: Anjou and some lords of the Catholic party joined her there soon afterwards. According to Charles's account of this meeting, as reported by his sister Margaret, he was then suddenly informed of a treasonable conspiracy on the part of the Huguenots against himself and family; was told that the admiral and his friends were at that moment plotting his destruction, and that if he did not promptly anticipate the designs of his enemies, and if he waited till next morning, he and his family might be sacrificed. Under this impression, he states, he gave a reluctant hurried consent to the proposition of his counsellors, exclaiming, as he left the room, that he hoped not a single Huguenot would be left alive to reproach him with the deed. The plan of the massacre had been previously arranged, and its execution intrusted to the Dukes of Guise, Anjou, and Aumale, Montpensier, and Marshal Tavannes.

It wanted two hours of the appointed time: all was still at the Louvre. A short time before the signal was given, Charles, his mother, and Anjou repaired to an open balcony, and awaited the result in breathless silence. This awful suspense was broken by the report of a pistol. Charles shook with horror—his frame trembled, his resolution failed him, and cold drops stood upon his brow. But the die was cast—the bell of a neighbouring church tolled—and the work of slaughter commenced.

This was at two o'clock in the morning. Before five o'clock the admiral and his friends were murdered in cold blood, and their remains treated with brutal indignity. Revenge and hatred being thus satiated on the Huguenot chiefs, the tocsin was sounded from the parliament house, calling on the populace of Paris to join in the carnage, and protect their religion and their king against Huguenot treason. It is not necessary to enter into the details of this most perfidious butchery. "Death to the Huguenots—treason—courage—our game is in the toils—Kill every man of them—it is the king's orders," shouted the court leaders, as they galloped through the streets, cheering the armed citizens to the slaughter. "Kill! kill!—bleeding is as wholesome in August as in May," shouted the Marshal Tavannes, another of the planners of the massacre. The fury of the court was thus seconded by the long pent-up hatred of the Parisian populace; and the Huguenots were butchered in their beds, or endeavouring to escape, without any regard to age, sex, or condition. Nor was the slaughter wholly confined to the Protestants. Secret revenge and personal hatred embraced that favourable opportunity of gratification, and many Catholics fell by the hand of Catholic assassins.

Towards evening the excesses of the populace became so alarming that the king, by sound of trumpet, commanded every man to return to his house, under penalty of death, excepting the officers of the guards and the civic authorities; and on the second day he issued another proclamation, declaring, under pain of death, that no person should kill or pillage another, unless duly authorised. Indeed it would seem that the massacre was more extensive and indiscriminate than its projectors had anticipated; and that it was necessary to check the disorderly fury of the populace. The slaughter however partially continued for three days. On the evening of the first day, Charles despatched letters to his ambassadors in foreign courts, and to all his governors and chief officers in France, bemoaning the massacre that had taken place, but imputing it entirely to the private dissension between the houses of Guise and Coligny.

On the following day, the 25th, he wrote to Schomberg, his agent with the Protestant princes of Germany, that having been apprised by some of the Huguenots themselves of a conspiracy formed by the admiral and his friends to murder him, his mother, and brothers, he had been forced to sanction the counter attacks of the house of Guise, in consequence of which, the admiral, and some gentlemen of his party, had been slain; since which, the populace, exasperated by the report of the conspiracy, and indignant at the restraint imposed

upon the royal family, had been guilty of violent excesses, and, to his great regret, had killed all the chiefs of the Huguenots who were at Paris.

Next day however Charles went in state to the parliament of Paris, and avowed himself the author of the massacre, claiming to himself the merit of having thereby given peace to his kingdom; he denounced the admiral and his adherents as traitors, and declared that he had timely defeated a conspiracy to murder the royal family.

These are the leading facts of the Bartholomew Massacre, concerning the truth of which there is no controversy. They are admitted and appealed to by historians who take the most opposite views of the motives which led to them. And this brings us to the second part of the subject.

§ 2. Two questions have arisen out of a consideration of the facts which we have just narrated:—1. Was the massacre the result of a premeditated plot, concealed with infinite cunning for months, according to some, years, that is, since the meeting at Bayonne in 1564; or was it the sudden consequence of the failure of the attack upon the life of the admiral two days before its occurrence?—2. Admitting it to have been premeditated, was Charles privy to the plot, and consequently, was the peace of 1570, the marriage of his sister, and his friendly demeanour towards the admiral and the Huguenot chiefs, one piece of the most profound treachery and dissimulation? Volumes have been written in reference to these questions; our limits confine us to a statement of their results.

We shall dispose of the first question rather summarily. The conferences at Bayonne between Catherine de' Medici and the Duke of Alva were secret: if ever reduced to writing, no direct proof of the decisions in which they terminated has come down to us. There is however strong substantial evidence to show that they related to the most effectual means of subduing the Protestants in France and Flanders. Mutual succour was stipulated and afforded. Adriano, a contemporary historian of credit, and who is supposed to have derived the materials of his history from the journal of Cosmo, duke of Tuscany, who died in 1574, states that Alva declared for an immediate extermination, and treated the proposition of France (to allure the Huguenot lords and princes back to the bosom of the ancient church) as faint-hearted, and treason to the cause of God. Catherine represented that such an extirpation as Alva contemplated was beyond the ability of the royal power in France. They agreed as to the end, but differed as to the best means of accomplishing it; and the conference terminated with the parties merely agreeing as to the general principle of destroying the incorrigible ringleader of the heretical faction; each sovereign being at liberty to select the opportunity and modes of execution which best suited the circumstances of his own dominions. This statement is adopted by the judicious De Thou. Strada, the historian of Alva's government in Flanders, who wrote from the papers of the House of Parma, says, in reference to the hypothesis, that the Bartholomew was planned at Bayonne, that he cannot from his own knowledge either affirm or deny the accusation; but inclines to the belief that it is true ("potius inclinatur animus ut credam"). It was on this occasion that Alva made use of the celebrated expression mentioned by Davila and Mathieu, and which Henri IV., then Prince of Bearn, and a stripling, who was present at the interview, told to Calignon, chancellor of Navarre, that he would rather catch the large fish and let the small fry alone; "one salmon," said he, "is worth a hundred frogs."—"Une tête de saumon valoit mieux que celles de cent grenouilles." The subsequent conduct of Alva and the queen-mother, coupled with this indirect testimony, enable us to answer the first question thus far in the affirmative: that there existed, as far back as the conference at Bayonne, a general determination on the part of the courts of Spain and France to subdue, if not extirpate Protestantism; but no concerted plot, or settled plan of operations.

The evidence is much more conflicting with regard to the sincerity of Charles in the affair of the peace of 1570, and the events that followed it, with regard to his share in devising the Bartholomew. Against the supposition of his having been perhaps the most profound dissembler that the world has ever seen, there is, in the first place, a strong objection derived from his extreme youth, and his fickle, restless, vehement, and childishly ungovernable character. He was only twenty-four when he died, and though nominally a king from the tenth year of his age, the government was so completely in the hands of his mother, and such was the ascendancy of that remarkable and wicked woman over his mind, that it is hardly possible to speak with certainty as to his genuine disposition, or to affirm on what occasions he was a mere puppet, and when a free agent. His vacillation of purpose has been remarked by those who have stigmatised him as a master of the arts of simulation; while the cruelty of his sports, and the ferocious violence of his temper when under the influence of passion, have been justly referred to as an argument to show that an heretical enemy once in his toils would have little to hope from his humanity. "His education," says Mr. Allen, who has sketched his character with no friendly hand, "had been neglected by his mother, who desired to retain the conduct of affairs, and brought him forward on those occasions only when she wished to inspire terror by his furious passions. Active, or rather restless, from temperament, he was never tranquil for an instant, but was continually occupied with some violent exercise or other; and when he had nothing better

to do, he would amuse himself with shoeing a horse, or working at a forge." But this was not the temperament of a deep dissembler. Adopting Papiré Masson's character of him as the true one, that he was impatient, passionate, false, and faithless, is it possible that he should have played the part of simulator and dissimulator to such perfection, that a scrutinising and suspicious observer like Walsingham, during three years that he was ambassador at the French court, in almost daily personal intercourse with him, never for a moment doubted his sincerity? Then, as we have seen, the admiral to the last moment placed the most undoubting confidence in the king's professions of friendship. Facts however are stubborn things, and we have no favourite hypothesis to support. When the marriage of the king's sister with the Prince of Navarre was under discussion, Pope Pius V. sent his nephew, the Cardinal Alexandrino, to the court of France to prevent it. Charles took the cardinal by the hand, and said (we quote from the 'Lettres d'Orléans,' referred to by Mr. Allen in his controversy with Dr. Lingard), "I entirely agree with what you say, and am thankful to you and the pope for your advice: if I had any other means than this marriage of taking vengeance on my enemies, I would not persist in it; but I have not. Cardinal Alexandrino was hardly gone from court, when the Queen of Navarre, the mother of Henri, arrived at Blois to conclude the marriage. Charles received her with every demonstration of affection and cordiality; boasted to her that he had treated the monk who came to break off the marriage as his impudence deserved; adding that he "would give his sister, not to the Prince of Navarre, but to the Huguenots, in order to remove all doubts on their minds as to the peace." "And again, my Aunt," said he, "I honour you more than the pope, and I love my sister more than I fear him. I am no Huguenot, neither am I a fool; and if Mr. Pope does not mend his manners, I will myself give away Margery in full conventicle." (Mathieu; 'Mémoires de l'Etat.')

It was on this occasion, according to De Thou, Sully, and other authorities, that Charles is said to have exultingly asked his mother—"Have I not played my part well?" "Yes," said she; "but to commence is nothing, unless you go through." "Leave it to me," he replied with an oath. "I will not tell for you, every one." Others postpone the vaunting of his dissimulation till after the massacre; and a manuscript in the 'Bibliothèque du Roi,' quoted by Mr. Allen, adds, "That he complained of the hardship of being obliged to dissimulate so long." There is one other trait of perfidy, among many told of him, which we shall quote, and leave to speak for itself.

On the evening of St. Bartholomew, and after he had given his orders for the massacre, he redoubled his kindness to the King of Navarre, and desired him to introduce some of his best officers into the Louvre, that they might be at hand in case of any disturbances from the Guises. These officers were butchered next morning in his presence.

That the peace of 1570 was, so far as Catherine de' Medici and her party was concerned, a piece of treachery, got up for the sole purpose of luring the Huguenot chiefs to their destruction, is the almost universal opinion of historians, and is admitted by those who deny that Charles had any guilty share in the transaction; De Thou alone hesitates to admit that long-meditated treachery. Opinions are more divided with respect to the closeness of the connection between the massacre and the general design to cut off the leader (the "tête de saumon" of Alva) of the Protestant party. One great difficulty presents itself. The attempt upon the life of the admiral was made at the instigation of Catherine and her son Anjou, the great devisers of the massacre. If they really designed from the first a general massacre, why did they run the very great risk of defeating their purpose by cutting off the admiral alone without the other leaders? If the admiral had fallen at the instant by the hand of the assassin, is it not highly probable that his friends would have fled from Paris to a place of safety!—at all events, they would not have been butchered unresistingly and in cold blood. On the other hand, if the death of the admiral was the sole or chief object of the machinations of the court, why did they defer it so long or attempt it in so bungling a way? The Italian writer Davila has furnished a refined and subtle explanation of this difficulty, characteristic of the dark plotting and wily policy of his country. According to this hypothesis (which is in some degree adopted by De Thou), the plan of Catherine and her secret council was, that Coligny should be assassinated under such circumstances as to fix the guilt upon the Guises, in the hope that the Huguenots would immediately rise in arms and wreak their vengeance upon the Guises; and that object having been obtained, that they would in turn be themselves overpowered and massacred by the royal forces. By this means Catherine would extinguish at one stroke the rival houses of Guise and Chatillon, both equally obnoxious to the court. But we agree with Mr. Allen that this hypothesis is too refined and uncertain a speculation even for Catherine, and that the difficulty is not explained by it. To our minds the difficulty is best explained by the supposition that Charles was not only not privy to the original design of the massacre, but that its plotters were doubtful of obtaining his consent. His occasional ferocity during and after the massacre, and the inconsistencies of his public declarations with respect to its origin, are by no means contradictory to this supposition, which moreover receives considerable support from what Sully tells us of his subsequent remorse. While

the massacre was going on, Charles seemed like one possessed. A few days after, he said to the celebrated Ambrose Paré, his surgeon and a Huguenot, "I know not how it is, but for the last few days I feel like one in a fever; my mind and body are both disturbed. Every moment, whether I am asleep or awake, visions of murdered corpses covered with blood and hideous to the sight, haunt me. Oh, I wish they had spared the innocent and the imbecile!" Charles died in less than two years after the massacre, in agony mental and physical. "In this state," says Sully, "the miserable day of St. Bartholomew was, without ceasing, present to his mind; and he showed by his transports of regret, and by his fears, how much he repented of it."

CHARLES X., King of France (CHARLES PHILIPPE, Comte d'Artois), born at Versailles, in October 1757, was the youngest son of the Dauphin, grandson of Louis XV., and brother of Louis XVI. His title, as a junior member of the royal family, was Comte d'Artois. The Duke de la Vauguyon, who was appointed tutor to him, as well as to his brothers, selected for their teachers several bishops and abbés.

Charles married, in the year 1773, Maria Theresa of Savoy, sister to the wife of his brother, afterwards Louis XVIII. His youth was dissipated and stormy, and he fought a duel with the Duke of Bourbon in consequence of a quarrel between them at the opera. When the disturbances which preceded the Revolution began, the Count d'Artois showed himself from the first opposed to concession, and he remained consistent in his opposition throughout the whole period of the Revolution, whilst his brother Louis, count of Provence, afterwards Louis XVIII., seemed to court popularity, and took pains to please the Constitutional party. Charles was one of the first to emigrate: he left France in July 1789, after the first popular insurrection and the destruction of the Bastille. He repaired to Turin, and from thence went to Vienna, and lastly to Pilnitz, where he attended the first congress of princes assembled to oppose the French revolution. After Louis XVI. had accepted the constitution in 1791, he invited the Count d'Artois to return to France, which he, in concert with his brother the Count of Provence, who had now joined him at Coblenz, refused to do, and they gave their reasons in a kind of manifesto. In consequence of this, the Legislative Assembly stopped his allowance on the civil list, and ordered the seizure of his property, in May 1792. The war having broken out, the Count d'Artois assumed the command of a body of emigrants, who acted in concert with the Prussian and Austrian armies on the Rhine. After the execution of Louis XVI. the Count d'Artois repaired to Russia, where he received fair promises from Catharine, but no efficient assistance. He then made an attempt on the coast of Brittany, but soon after returned to England, and went to reside in Edinburgh, where he remained some years. In 1809 he rejoined his brother, who had assumed the title of Louis XVIII., at Hartwell. In 1814 he went to Germany to wait for events. After Napoleon's abdication, he entered France with the title of Lieutenant-General of the Kingdom, and issued a proclamation to the French, in which he promised liberty and order, the reign of the law, the abolition of the conscription, and of the "droits réunis," and an entire forgetfulness of the past. He entered Paris on the 12th of April 1814, attended by a body of national guards. The Senate acknowledged his authority, in expectation of the arrival of Louis XVIII. He told the Senate that his brother was determined to reign as a constitutional king, with two chambers, and to grant individual liberty and the liberty of the press. When Louis XVIII. arrived in Paris, the Count d'Artois, whose title was now that of 'Monsieur,' was made Colonel-General of the National Guards. In March 1815 he was obliged to leave France with the king, in consequence of Bonaparte's return from Elba, but he went back after the battle of Waterloo. In February 1820 he lost his second son, the Duc de Berry, by the hand of an assassin. His elder son, the Duc d'Angoulême, who had married his cousin, the daughter of Louis XVI., was childless. The Duc de Berry left only one daughter, but several months after his death his widow was delivered of a son, the present Duc de Bordeaux.

Louis XVIII. died on the 16th of September 1824, and Charles X. was proclaimed king. On the 27th he made his entrance into Paris in the midst of acclamations. One of his first acts was an ordinance abolishing the censorship of the newspapers and other periodicals, which had been re-established by an ordinance of his predecessor in the previous month of August. This threw over him a momentary gleam of popularity; but there was a strong party, or rather a combination of parties, which disliked and mistrusted him from the first, and by his bigotry and folly he soon justified their mistrust. In April 1825, a project of a law, or bill, was laid by ministers before the chambers against the guilt of sacrilege, awarding the penalty of death for the profanation of the consecrated host, and other severe penalties for the profanation of the sacred utensils of churches, &c. The law was passed; but it had a bad effect on public opinion. By another law, an annual sum of thirty millions of francs was charged on the national debt, to be distributed as an indemnity among the emigrants whose property had been confiscated. In April 1826, a declaration signed by most of the archbishops and bishops of France was presented to the king, denouncing all attempts to subject the temporal authority of kings to the papal power, a principle always reprobated by the Gallican Church. In 1827 a law was passed against the slave-trade, which contained against those engaged in it the penalties of

banishment, fines, and confiscation. In the same session a bill was presented by ministers concerning the 'police of the press,' which in effect re-established the censorship for all pamphlets of less than 21 sheets, though it was not till a few months later that it was formally re-established. The new bill also compelled the editors of periodical papers to declare the names of all the proprietors of the papers, and give security to a heavy amount. Under the third head of the bill, severe penalties were inflicted for offences of the press against the person of the king, the royal dignity, the religion of the state, and other communions acknowledged by the state, foreign sovereigns and princes, the courts of justice, &c. After a warm debate ministers thought proper to withdraw their bill; this created a lively sensation in Paris. Soon after, at a grand review of the national guards, Charles X. was saluted by cries from the ranks of "Down with the ministers;" "Down with the Jesuits!" The king, looking on some of the most clamorous, told them firmly, "I am come here to receive homage, and not lessons." He then disbanded the national guards. In November the king dissolved the House of Deputies, and directed new elections to be proceeded with. He then took off again the censorship of the journals. By another ordinance he created seventy-six new peers. In January 1828 a new ministry was formed. Messrs. Villele, Peyronnet, Corbière, &c., gave in their resignations, and were succeeded by Viscount Martignac, and Counts de la Ferronnays, Portalis, and others. This change was considered as a sort of concession to liberal principles. A commission was appointed, at the suggestion of the new ministry, to frame a project of municipal administration for all France. Another commission was formed to inquire into the discipline and method of education which prevailed in the 'petits Séminaires,' or colleges for clerical students, which were said to have fallen under the direction of disguised Jesuits, as the Society of the Jesuits was not authorised by the laws of France.

The king's speech at the opening of the session of 1828 was conciliatory. A law was passed in the Chambers concerning newspapers and other periodicals, fixing the amount of security to be given by the proprietors, and enacting other regulations for the police of the press. The commission on the clerical seminaries having made its report, stating that seven or eight of those establishments were actually under the direction of members of the Society of Jesuits, the king issued an ordinance placing the establishments thus specified under the jurisdiction of the university, and ordering that in future no director or teacher should be admitted in any clerical seminary unless he declared in writing that he did not belong to any of the religious congregations not legally established in France.

In 1829 an elaborate project of a new municipal law was laid before the Chambers by the Martignac ministry. It was rejected, and the king was encouraged to try a ministry of decided royalists. This new ministry was appointed in August 1829, after the Chambers had been prorogued. It consisted of Prince Polignac, Messrs. Montbel, Haussez, La Bourdonnaye, Guernon Rainville, and others. As soon as the new appointments were known the public indignation broke forth, and a loud cry was set up by the newspapers that the king should dismiss the obnoxious ministers. Associations were formed with the object of refusing to pay the taxes. Prosecutions were instituted by the king's attorneys against the more violent journals, but in several instances the courts acquitted the accused. Meantime the country was thriving, the new ministers were effecting retrenchments, and proposing a corresponding reduction of taxation.

On the 2nd of March 1830 Charles X. opened the Chambers. He spoke of his friendly relations with the foreign powers, of the final emancipation of Greece, of the intended expedition against Algiers, and he lastly expressed his firm resolve to transmit to his successors the unimpaired rights of the crown, which he said constituted the best safeguard of the public liberties secured by the Charter. In reply to this speech, the address voted in the Chamber of Deputies, by a majority of forty, told the king plainly that his ministers had not the confidence of the representatives of the nation. The deputies who voted this address were 221 in number. The king, on receiving the address, said that his heart was grieved to find that he had not the support of the Chambers, in order to fulfil all the good which he intended; his resolutions however were immovable. His ministers would let them know his intentions. The next day, the 19th of March, the Chamber was prorogued to the 1st of September, and some time after a dissolution was proclaimed, and new elections were made. During the spring incendiary fires broke out in Normandy and other provinces, and the sufferers were mostly small farmers and cottagers. Among those who were seized as guilty of incendiarianism, the majority were women. Suspicious and mutual accusations were bandied about from one political party to the other concerning these fires, but no clue was obtained as to the real investigators. The new elections increased the opposition majority to nearly two-thirds of the number of deputies. Meantime news arrived of the conquest of Algiers, but the tidings were received surlily by the opposition. Every act of the ministry was reprobated. This state of things could not last. The king called together a council of ministers, in which it was resolved to give an extended interpretation to article 14 of the Charter, which gave the king the power "of providing by ordinances for the safety of the state, and for the repression of any attempt against the dignity

of the crown." On the 25th of July the king issued several ordinances countersigned by his ministers. The first ordinance suspended the liberty of the periodical press. No journal or periodical was to be allowed to appear without the royal permission. No pamphlet of less than twenty sheets was to be published without the permission of the secretary of state for the home department, or of the local prefect. Ordinance 2 dissolved the newly-elected House of Deputies, which had not yet assembled. Ordinance 3 altered the system of election, reduced the number of the deputies from 430 to 253, and placed the new elections under the direct influence of the prefects. All the ordinances showed but too plainly the spirit in which the king was 'immoveably' determined to reign; but the last ordinance was decidedly an infraction of the constitution or Charter, for the king had no right to alter the law of election. The sequel is well known. Most of the editors of newspapers signed an energetic protest against the ordinances, and continued to publish as before, and the tribunal of first instance, and the tribunal of commerce, authorised them to do so. Then came the protest of a number of deputies, denouncing the ordinances as illegal, and proclaiming popular insurrection as a duty. Several master manufacturers turned out their men and shut up their factories, and a mass of people took up arms. Meantime Charles remained quietly at St. Cloud, and merely sent Marshal Marmont to take the command of the garrison of the capital, which consisted of about 10,000 men, one-half of whom could not be depended upon. On the 27th of July the first encounter took place between the troops and the people. Next day an ordinance declared Paris to be in a state of siege, or, in other words, under martial law. The fighting in the streets became more general. Many of the national guards joined the people, who hoisted the tri-coloured flag, in opposition to the white flag of the Bourbons. The Hôtel-de-Ville was taken and retaken. On the 29th the people attacked the Louvre and the Tuileries, the regiments of the line abandoned their post, and Marmont with the guards evacuated Paris. On the 30th a number of deputies and peers proclaimed the Duc d'Orléans lieutenant-general of the kingdom, and Charles X. confirmed his nomination on the 1st of August. On the 2nd of August Charles X. abdicated the crown in favour of the Duc de Bordeaux, and set out for Cherbourg. The Chambers however would not recognise the claims of the Duc de Bordeaux, and elected the Duc d'Orléans. [LOUIS PHILIPPE.] From Cherbourg Charles sailed for England, and finally took up his residence at Holyrood House. He afterwards removed to Prague in Bohemia, where the Emperor of Austria gave him the use of the royal palace. In the autumn of 1836 he removed to Goritz in Styria, for the sake of a milder climate. He there rented the château or mansion of Gräfenberg, but soon after his arrival he fell ill of the cholera, and died on the 6th of October, 1836. His body was embalmed and buried in the vaults of the Franciscan convent of Goritz. His son, the Duc d'Angoulême, who as well as his grandson, the Duc de Bordeaux, had attended him in his last moments, did not assume the royal title, but went by the name of Count de Marnes. The Duc d'Angoulême died at Goritz in June, 1843. [BORDEAUX, DUC DE.]

CHARLES XII., of Sweden, was born at Stockholm, in June 1682. At fifteen years of age, in 1697, he succeeded his father, Charles XI., a harsh and despotic prince, who had abolished the authority of the senate and rendered himself absolute. Charles was brought up in his father's principles, and he showed from his earliest youth great self-will and obstinacy, and an excessive fondness for military exercises. When he was eighteen, a league was formed against him by Frederic IV., king of Denmark, Augustus, elector of Saxony and king of Poland, and Peter I. of Russia, the object of which was to dismember Sweden. Charles sailed immediately with an army for Copenhagen, besieged that city, and in a few weeks obliged the king of Denmark to sue for peace. He next sailed for the coast of Livonia, then a Swedish province as well as Ingria; which latter was invaded by the Russians, who besieged Narva. On the 30th November 1700, Charles, at the head of 8000 well disciplined Swedes, attacked a disorderly body of 80,000 Russians, and completely defeated them. He next turned his arms against King Augustus; but not satisfied with defeating him repeatedly and taking Courland from him, he determined upon deposing him and placing on the throne of Poland a young Polish nobleman, Stanislaus Leszcynski, palatine of Posnania, who by his manner and address had won the favour of Charles. In this project he was favoured by a considerable faction among the Polish magnates, always dissatisfied with their sovereigns, and ever ready for change. After several battles and negotiations, Charles, having overrun the greater part of Poland, dictated to the Diet the nomination of his favourite, and Stanislaus was proclaimed king of Poland in July 1704. Augustus however, at the head of his Saxon troops and a party of Poles and Lithuanians, assisted by Russian auxiliaries, kept up a desultory warfare in several provinces of Poland; but Charles, at the head of part of his army, having crossed the Oder and entered Saxony, Augustus was obliged to sue for peace, which was concluded at Leipzig in the beginning of 1707. Augustus resigned the crown of Poland to Stanislaus, and retired to his hereditary Saxon dominions. [AUGUSTUS II.]

Charles, in his head-quarters near Leipzig, at the head of a victorious army of nearly 50,000 Swedish veterans, had for a while the eyes of all Europe fixed upon him. He received ambassadors from all the principal powers, and the Duke of Marlborough himself went to Leipzig,

and had a long interview with Charles, whom he wished to induce to join the allies against Louis XIV. But Charles's views were directed to the north; his great object was to dethrone his rival, Peter of Russia. He however obliged the emperor Joseph I. to subscribe to several conditions which he dictated; among others, he required that the Protestants of Sillesia should have the free exercise of their religion, and a certain number of churches given to them by the government. Having settled these affairs, he marched out of Saxony in September 1707, at the head of 43,000 men, to carry the war into Muscovy. Another corps of 20,000 Swedes, under General Löwenhaupt, was stationed in Poland. In January 1708, Charles crossed the Niemen near Grodno, and defeated the Russian troops which had entered Lithuania. In June 1708 he met Peter on the banks of the Beresina. The Swedes crossed the river, and the Russians fled precipitately to the Dnieper, which Charles crossed after them near Mohilow, and pursued them as far as Smolensk, towards the end of September. But here Charles began to experience the real difficulties of a Russian campaign. The country was desolate, the roads wretched, the winter approaching, and the army had hardly provisions for a fortnight. Charles therefore abandoned his plan of marching upon Moscow, and turned to the south towards the Ukraine, where Mazepa, hetman or chief of the Cossaks, had agreed to join him against Peter. Charles advanced towards the river Desna, an affluent of the Dnieper, which it joins near Kiew; but he missed his way among the extensive marshes which cover a great part of the country, and in which almost all his artillery and waggons were lost. Meantime the Russians had dispersed Mazepa's Cossaks, and Mazepa himself came to join Charles as a fugitive with a small body of followers. Löwenhaupt also, who was coming from Poland with 15,000 men, was defeated by Peter in person. Charles thus found himself in the wilds of the Ukraine, hemmed in by the Russians, without provisions, and the winter setting in with unusual severity. His army, thinned by cold, hunger, and fatigue, as well as by the sword, was now reduced to 24,000 men. In this condition Charles passed the winter in the Ukraine, his army subsisting chiefly by the exertions of Mazepa. In the spring, with 18,000 Swedes and as many Cossaks, he laid siege to the town of Pultawa, where the Russians had collected large stores. During the siege he was severely wounded in the foot; and soon after Peter himself appeared to relieve Pultawa, at the head of 70,000 men. Charles had now no choice but to risk a general battle, which was fought on the 8th of July 1709, and ended in the total defeat of the Swedes, 9000 of whom remained on the field of battle. With the remainder Charles fled towards the frontiers of Turkey, which he reached almost alone at Onzakow, on the limen of the Bog and Dnieper. He claimed the hospitality of Sultan Achmet III., who assigned to him a liberal allowance, and the town of Bender on the Dniester for his residence. We shall not here speak of the foolish behaviour of Charles while a refugee at Bender, of his arrogance towards the Turks, his generous entertainers, whom he absolutely obliged to fight him and his little band of followers, and at last to remove him to Demotica near Adrianople, where they continued to treat him with a generous forbearance. At last in October 1714, Charles left Turkey, and crossing Hungary and all Germany, arrived in sixteen days at Stralsund. Without going to Stockholm, he immediately took the field against Prussia, Denmark, Saxony, and Russia leagued against him, obtained some advantages, was afterwards besieged in Stralsund, and obliged to retire to Sweden at the end of 1715. In March 1716 he invaded Norway at the head of 20,000 men, and advanced to Christiania, but was obliged by want of provisions to return to Sweden. He entered into negotiations with Peter, but still pursued the war against the Danes, and in October 1718 he again invaded Norway, and besieged Friedrichshall in the midst of winter. On the evening of the 11th of December, while he was inspecting the trenches exposed to the fire of a battery, he was struck in the head by a shot, and died instantly, in his thirty-seventh year. For the particulars of his adventurous career, Voltaire's *'Histoire de Charles XII.'* is the chief authority; it is generally considered correct, and is warranted by the testimony of Stanislaus, king of Poland. (See the *'Attestation'* prefixed to Voltaire's *'Life of Charles XII.'*)

Charles was a true specimen of a conqueror for mere glory, as it is called; his passion for war engrossed all his thoughts, and he seems to have had no idea that a nation could be glorious and happy in a state of peace. In one respect he was superior to most conquerors. He maintained a most exemplary moral discipline in his army, which did not disgrace itself by the licentiousness and the atrocities which have marked the steps of most other invaders.

CHARLES XIV., of Sweden, CARL XIV. JOHAN (JEAN BAPTISTE JULIEN BERNADOTTE), born at Pau in the Béarn, in January 1764, was the second son of a lawyer in that town. He was educated in his paternal home till the age of seventeen, when one day he left it abruptly and enlisted as a volunteer in the regiment royal marine, in 1780. His first service was in the island of Corsica, where he remained two years. On his return to France, he rose gradually through his own good conduct to the rank of adjutant. He was doing garrison duty at Marseille in 1790, when the revolution began. Bernadotte had the good fortune to save his colonel, the Marquis d'Amberg, from the popular fury which was then excited against the nobles. Bernadotte was next promoted into the regiment of Anjou, and as

the royalist officers emigrated in crowds, promotion became rapid for those who remained under their colours. Bernadotte was soon made a colonel, and when the war broke out against Austria and Prussia, he was sent to the army of the Rhine under General Custine, where he distinguished himself, was made chief of brigade, and afterwards became general of division in the army of Sambre-et-Meuse, under Kleber and Jourdan. He served in the well-contested campaigns of 1795-96, against the Austrian Generals Clairfait, Kray, and the Archduke Charles. At the beginning of 1797, he was ordered by the Directory to march with 20,000 men from the Rhine to Italy, to reinforce General Bonaparte. Bernadotte commanded the advanced guard in the campaign of 1797, and distinguished himself at the passage of the Tagliamento, and in the invasion of Carniola. After the preliminaries of peace were signed at Leoben, Bonaparte returned to Milan and left Bernadotte in command of the advanced posts in the Venetian province of Friuli. He received afterwards the thanks of the States of Friuli for his humanity and kindness towards the inhabitants of that country.

During the negotiations for the definite peace, Bonaparte sent Bernadotte to Paris to present to the Directory the standards taken from the Austrians. On his return to head-quarters, in October 1797, Bonaparte interrogated him concerning the disposition of the various parties towards himself. Bernadotte told him frankly that he must not depend upon any party, that the Directory were suspicious of him, that he could not expect any reinforcements in case of a new campaign against Austria, and that the wisest thing that he could do was to hasten to conclude peace with the emperor. Four days afterwards, Bonaparte signed the treaty of Campoformio. On leaving Italy, Bonaparte took away from Bernadotte one-half of the troops which he had brought with him from the Rhine, and ordered them back to France. Bernadotte, offended at this, requested of the Directory a command in the colonies, or if not to accept his resignation. The Directory appointed him ambassador at Vienna.

In his embassy at Vienna, Bernadotte assumed a conciliatory and temperate tone, and even made no outward display of the revolutionary flag and cockade, till expressly ordered by the Directory to hoist the tri-coloured flag above the entrance of his hotel. This was done on the 13th of April 1798, and led to a riot which was only quelled by the interference of the military. Bernadotte after this left Vienna, but after some diplomatic explanations the affair was hushed up. In the following August, 1798, Bernadotte married at Paris a younger sister of Joseph Bonaparte's wife of the name of Clary. In the following year he was appointed Minister-at-War, at a time when the French armies were discouraged by reverses, and were in a state of great destitution. He exerted himself to re-establish confidence and discipline, and to protect the French frontiers, which were threatened by the allies. He furnished Massena with the means of resuming offensive operations, which led to the defeat of the Russians at Zürich. By one of those intrigues so frequent in the councils of the French Directory, Bernadotte was recalled from the war ministry; and he was living unemployed at Paris when Bonaparte arrived from Egypt. Bonaparte tried to cajole him into an acquiescence with his views previous to the revolution of Brumaire, but Bernadotte firmly refused to join him in upsetting the constitution of the republic, and would have opposed him by force had the Directory so ordered him. A military man, he remained strictly within the line of military duty. Bonaparte knew this; and having become First Consul, he gave Bernadotte the command of the army of the west, for the purpose of pacifying La Vendée and the other disturbed districts.

After his assumption of the empire, Napoleon made Bernadotte a marshal, and sent him, in 1804, to command the army which was stationed in Hanover. He there put a stop to the irregularities and arbitrary acts which had taken place in consequence of the military occupation, and contrived to provide for the wants of his soldiers without distressing the inhabitants. This was the beginning of the good reputation which he acquired in North Germany, and which afterwards contributed materially to raise him to the throne of Sweden. In 1805 Marshal Bernadotte left Hanover with his corps to join Napoleon's army against Austria. He was present at the battle of Austerlitz, where he broke through the centre of the Russians. In June 1806, Napoleon created Bernadotte Prince of Ponte-corno, which he designated as "immediate fief of the imperial crown." In the war against Prussia, Bernadotte commanded the first corps. He had some altercation with Davoust about precedence, on the eve of the battle of Jena; he afterwards defeated the Prussians at Halle, and pursued Blücher as far as Lübeck, where he defeated him. He fought afterwards against the Russians, and was wounded just before the battle of Friedland. After the peace of Tilsit, Napoleon appointed him commander-in-chief in North Germany, from Embden to Lübeck, with orders to take possession of the Hanseatic towns; to exclude the English trade entirely all along that line, and to induce Denmark to make common cause with France. The English expedition against Copenhagen deranged, in part, Bonaparte's calculations. In March 1808, Napoleon ordered Bernadotte to march into Denmark, and to invade Sweden in concert with the Danes by passing over the ice. But the Danes were slow, the thaw came, the English cruisers appeared again in the Sound, and Bernadotte remained in Denmark. Part of the troops under him consisted of two Spanish divisions, one of which,

under the Marquis la Romana, was stationed in the island of Fünen. The marquis, having learnt the invasion of Spain by the French, embarked his men on board the English fleet, and Bernadotte had just time to prevent the other division from following their example. In April 1809 Bernadotte was ordered to join the army on the Danube, for the war against Austria. He took the command of the ninth corps, chiefly composed of Saxon troops. At the battle of Wagram, 5th of July, whilst opposed to the principal body of the Austrian army, he was deprived by Napoleon of his reserve division, which received another destination. The consequence was that he was obliged to fall back and evacuate the village of Deutsch Wagram. The following morning he expostulated in very strong words with Napoleon, on the order which had deprived him of his reserve, and exposed him to be crushed by superior forces. The battle was resumed, and, after another desperate contest and a fearful loss, was gained by the French. Bernadotte's corps alone lost six thousand men. An armistice being concluded, the marshal demanded his retirement and obtained it. Having returned to Paris, about the time when the English landed at Flushing, the minister of the interior and the minister-at-war urged Bernadotte to take the command of the troops hastily collected to oppose the enemy and protect Antwerp. He did so, but Napoleon soon after took away his command, and replaced him by Marshal Bessières: he was offended at some sentence of a proclamation which Bernadotte had addressed to his soldiers. The marshal was nettled, but the minister-at-war sent him back to the army at Vienna. There he had again a warm explanation with Napoleon, and a seeming reconciliation took place. When he set out to return to Paris, Napoleon left Bernadotte in command at Vienna, till the ratification of the treaty of peace with Austria. At the beginning of 1810 Napoleon offered him the government-general of the Roman States. Bernadotte hesitated, but at last accepted, and began making his preparations.

Meantime important events had taken place in the North, in which Bernadotte was to act an unexpected part. Gustavus IV., king of Sweden, had been obliged to abdicate the crown in March 1809 on account of his incapacity; and the States of Sweden had declared him and his descendants excluded for ever from the throne. His uncle, the Duke of Sudermania, assumed the government under the title of Charles XIII. Being childless, the States chose for prince royal and heir to the throne, Augustus of Holstein Augustenburg, brother of the reigning Prince of Augustenburg. But in less than a year Prince Augustus died suddenly, whilst reviewing some troops at Helsingborg, 26th of May 1810. It was necessary to choose another heir to the crown of Sweden. Several candidates presented themselves; the brother of the deceased prince, and the King of Denmark, among others; but none of them seemed to suit the circumstances of Sweden. Sweden required a man of firmness, a good administrator, and of tried military abilities. Bernadotte had displayed all these qualities during his command in North Germany in 1808 and 1809. The people of Hamburg and the other Hanseatic towns spoke highly of his justice and moderation. He had behaved with kind regard towards the Swedish prisoners of war, and had readily granted an armistice on the first application of the Duke of Sudermania, afterwards Charles XIII., who on the present occasion cast his eyes upon him, and proposed to the Swedish Diet assembled at Örebro in August 1810 Marshal Bernadotte, prince of Pontecorvo, as prince royal of Sweden. "His majesty," said the message, "having consulted the Secret Committee, as well as the Council of State, on this important question, has met with a great majority in the first and a unanimity in the second of these bodies in favour of his proposal. The Prince of Pontecorvo being once entrusted with the future destinies of Sweden, his established military reputation, whilst ensuring the independence of the kingdom, will make him avoid useless wars for the mere sake of renown; his mature experience and energy of character will maintain order in the interior; and the love of justice and humanity which he has exhibited in hostile countries is a guarantee of his conduct towards the country which should adopt him; and lastly, the existence of his son will put an end to any further uncertainty concerning the succession to the crown." Two Swedish officers had been sent to Paris to sound Bernadotte on the subject of his election. Bernadotte asked the emperor Napoleon, who told him, that if he were elected by the free choice of the Swedes he (the emperor) would consent to his accepting the crown. "I cannot assist you however in this," added Napoleon, "but let things take their own course." It being rumoured however that the French minister at Stockholm supported the claims of the King of Denmark, Bernadotte frankly told Napoleon of this, who seemed to disbelieve it, and soon after recalled his minister. The Emperor Alexander, on his part, did not oppose Bernadotte's election, but rather approved of it. On the 21st of August 1810, the Diet voted unanimously, and in the midst of acclamations, Jean Baptiste Jules Bernadotte, prince of Pontecorvo, to be prince royal of Sweden and heir to the throne, on condition of his adopting the Communion of Augsburg. Charles XIII., at the same time, formally adopted him as his son. A Swedish envoy carried these documents to Paris, with letters from the king to the new-elected prince and to the emperor Napoleon, who both answered in the affirmative. Bernadotte however could not leave France without having received letters of emancipation, relieving him from his allegiance to the emperor. After waiting a

month, Bernadotte complained to Napoleon of the delay, when the latter told him, that his Secret Council had decided that the letters of emancipation should only be delivered to him after he had signed an engagement never to wage war against France. Bernadotte replied with some warmth, that the condition was impossible; that by the very act of his election he was precluded from entering into any engagement towards a power foreign to Sweden, and that nothing remained for him but to renounce the proffered dignity. Napoleon mused for a moment, then said, hurriedly, "Well, go! let our destinies be accomplished." He then reverted to the continental system, and said that Sweden must conform itself to it. Bernadotte observed, that he must have time to examine things on the spot, to make out the feelings of the Swedes, and make himself acquainted with their interests. "How long do you require?" cried out Napoleon. "Till next May," said the prince. This was at the beginning of October. "I grant you this delay," replied Napoleon; "but then declare yourself, either friend or enemy." Bernadotte hastened to leave France, but did not think himself safe until he had crossed the Sound. The day of his departure from Paris, Napoleon told Duroc that he wished that Bernadotte had refused; but that Bernadotte did not like him; that they had never understood one another, and that it was now too late.

The prince royal was met at Elsinor by several Swedish high dignitaries, and the Archbishop of Upsal among the rest. He told that prelate that he had been in his youth instructed in the reformed religion, which was professed by many in his native Béarn, that he had since conversed in Germany with Protestant clergymen on religious subjects, and that he now declared that he believed in the doctrine contained in the Confession of Augsburg, such as it was presented by the princes and states of Germany to the emperor Charles V. On the 20th of October he landed at Helsingborg, and he entered Stockholm on the 2nd of November, amidst the salutes of the artillery. On the 5th he attended the Assembly of the States, in which Charles XIII. presided. He addressed the king and the States in succession, declaring his intention to live entirely for the good of his adopted country. "Brought up in the camp," he thus concluded, "I have been familiar with war, and am acquainted with all its calamities; no conquest can console a country for the blood of its children shed in a foreign land. Peace is the only glorious object of a wise and enlightened government. It is not the extent of a country, but its laws, its commerce, its industry, and above all its national spirit, that constitute its strength. Sweden has of late experienced great losses, but the honour of the Swedish name remains unscathed. We have still a land sufficient for our wants, and iron to defend ourselves." Two days after despatches came from Napoleon, demanding in the most imperious tone that Sweden should declare immediately war against England. The winter was setting in, precluding all hopes of assistance from England in case of an attack by the French troops through Denmark. In this emergency the king declared war against England; but his situation was well understood by the British cabinet, and the result was a state of non-intercourse rather than hostilities. But Napoleon did not stop here; he demanded a draft of Swedish sailors for the French fleet, a body of Swedish troops for the French army, the introduction of French custom-house officers at Gothenburg, and, lastly, the formation of a Northern Confederation, consisting of Sweden, Denmark, and the duchy of Warsaw, under the protection of France. All these demands were respectfully but firmly refused; but the prince royal became convinced, that with such a man as Napoleon, Sweden could not remain at peace and retain its independence as a nation. He wrote several letters to Napoleon, explaining the delicate and painful position in which he found himself. Sweden could not live without maritime trade. After three months, Napoleon answered by fresh demands of hostilities against Great Britain, and of a vigorous exclusion of all English or colonial goods. Meantime, French privateers in the Baltic and Northern seas seized the Swedish vessels, whilst the French authorities confiscated the Swedish ships in the German ports, and marched their crews into France to serve in Napoleon's dockyards. Napoleon treated Sweden as an enemy. The year 1811 was a dreadful period for Sweden, and the prince royal in particular, and his health was affected by his anxiety. At last a fresh act of violence of Napoleon put an end to all uncertainty. In January 1812, French troops invaded Swedish Pomerania and the island of Rügen; arrested the public functionaries, who were sent to the prisons of Hamburg, and replaced them by Frenchmen; disarmed two Swedish regiments, which had been surprised under the appearance of peace, and sent the men prisoners into France; and sequestrated all public property and all Swedish vessels in the port of Stralsund. All Sweden was roused at the news. The prince royal wrote a strong remonstrance to Napoleon upon this wanton outrage against the rights of Sweden as a nation. Charles XIII. sent an envoy to St. Petersburg to conclude an alliance with the Emperor Alexander, which was signed on the 24th of March, and from that time the prince royal, having renewed friendly relations with England, exerted himself to promote peace between Russia and England, and Russia and Turkey. All this was well known at Paris, while Napoleon was preparing his gigantic expedition against Russia. It was a very bold step for Sweden thus to throw the gauntlet at the great conqueror; but the step was taken with the courage of despair, for Napoleon would not let any nation live independent. Those who have talked of Bernadotte's treason, as they call it, of his taking

advantage of Bonaparte's Russian disasters to give him an inglorious blow, forget dates and misrepresent circumstances. They have confounded the treaty of St. Petersburg in March, with the treaty of Abo in August 1812. Sweden had chosen her part, forced to it by Napoleon's outrageous injustice, long before the breaking out of the Russian war. After that war had begun, and about the middle of August, the prince royal repaired to Abo in Finland to have an interview with the Emperor Alexander, who was delighted with his manner and conversation. It was then agreed that Sweden should take an active part in the war by landing an army in North Germany, which would be joined by a corps of Russians. At the same time it was stipulated that Norway should be detached from Denmark, a power closely and perpetually allied with the common enemy, Napoleon, and be annexed to the crown of Sweden in compensation for the loss of Finland. The accession of Great Britain to the treaty was solicited, and after a time obtained. This treaty was signed at Abo, 18th of August. The prince royal having reviewed a body of 85,000 Russians, who were to be placed immediately at his disposal, told Alexander, "They are very fine troops, and you can ill spare them just now; send them instead to Riga, to reinforce Wittgenstein, who has great difficulty in defending himself against Macdonald and Victor. If the French succeed there they will march on St. Petersburg." "That is very handsome of you," said Alexander; "but how will you obtain possession of Norway." "If you succeed," said the prince, "you will keep your promise. If you succumb, Europe is enslaved; all crowns will be withered by subjection to Napoleon. Better then go and till a field than reign under that condition." The troops were sent across the Gulf of Finland to Wittgenstein, just in time to save Riga and St. Petersburg. The prince royal, after his return to Stockholm, kept up a familiar correspondence with Alexander during the whole of the memorable Russian campaign, gave him the best advice, and supported his spirits. After the French retreat from Moscow, the Swedish cabinet signified to the French chargé d'affaires at Stockholm that all diplomatic relations with France had ceased, and sent him his passports. This was resented in a note by Maret, Napoleon's secretary for foreign affairs, to which the prince royal replied by an eloquent letter addressed to Napoleon, in March 1813, which was afterwards printed and circulated throughout Germany.

In May the prince royal landed at Stralsund with about 25,000 Swedes, and advanced towards the Elbe. Soon after, an armistice having been concluded between the Russians and the French, the prince royal had an interview with the Emperor Alexander and the King of Prussia at Trachenberg in Silesia. He laid before them a plan of operations for the various allied armies during the ensuing campaign, pointing to Leipzig as their ultimate place of meeting. When hostilities began again, the prince royal, at the head of the army called 'of the North,' which consisted of Swedes, Russians, and Prussians, protected Berlin against the advance of the French under Oudinot, whom he repulsed at Gross Beeren; and he afterwards defeated Ney at Dennewitz, 6th of September, which saved Berlin a second time, and drove the French upon the left bank of the Elbe. Napoleon began his retreat from Dresden upon Leipzig, whither the movements of the allies were converging, and there he sustained his signal defeat, which decided the evacuation of Germany by the French. The prince royal contributed greatly to the success of that battle on the 18th of October, and the following day he forced his way into the town, where he met in the great square the Emperor Alexander and the King of Prussia, according to the agreement of Trachenberg.

Leaving to others the pursuit of the French to the Rhine, the prince royal turned towards the north to attack Davoust and his allies the Danes on the Lower Elbe. He defeated the Danes, who demanded an armistice, and then blockaded Davoust in Hamburg. On the 14th of January 1814 a treaty was concluded at Kiel between Denmark and Sweden, by which the former power gave up Norway to the crown of Sweden, and joined the coalition. The prince royal then hastened to the Rhine, and fixed his head-quarters at Cologne and afterwards at Liege, whence he urged the Emperor Alexander to make peace with France, having the Rhine, the Alps, and the Pyrenees for its boundaries. He wrote in the same strain to the Swedish minister at the Congress of Chatillon, and he also advised Napoleon, through an indirect channel, to make peace, or he would lose his crown. He himself would take no part in the campaign in France in 1814. He always strongly opposed the idea of any dismemberment of France, or of forcing any particular dynasty upon the French. "Let Germany and Holland be free," he said, "and let the French choose their own government." And the Emperor Alexander coincided with him; but Napoleon, by rejecting all proposals, hurried on his own fall. The prince royal's paramount duties however were towards his adopted country, Sweden, which expected a compensation for all her past sufferings and her present exertions for the common cause. He went to Paris, incognito, to confer with Alexander on the subject of Norway, as Denmark seemed little inclined to fulfil the treaty of Kiel. The emperor, faithful to his word, obtained the sanction of all the allies, and placed at the disposal of the prince royal his troops in North Germany. The prince then set off for Brussels, where he collected his Swedish troops, and marched them back to the shores of the Baltic.

Christian Frederic, prince of Denmark, had hoisted in Norway the flag of independence. The Norwegians, he said, were freed from their

allegiance to the crown of Denmark, but they were not bound by the conditions of the treaty of Kiel. He assembled a sort of diet at Elsvold, which framed a liberal constitution, and elected Christian for their king, who soon after dissolved the assembly. The King of Denmark sent commissioners to summon Christian to fulfil the treaty of Kiel, but little attention was paid to this formality. Four commissioners of England, Russia, Prussia, and Austria, came to remonstrate in favour of the same treaty, but obtained only evasive answers. A Swedish army and fleet were then put in motion against Christian. King Charles XIII. and the prince royal commanded in person. After some trifling actions on the frontier the Swedes entered Norway; an armistice was concluded; and the Storting, or general assembly of Norway, being convoked, required Christian to renounce the authority with which he had been intrusted by the nation. Christian abdicated, and returned to Copenhagen. The Storting then entered into communication with the Swedish commissioners, and after some deliberation elected unanimously Charles XIII. of Sweden to be king of the kingdom of Norway, and Carl Johan as prince royal. The king and prince, on their part, swore to the constitution of Norway as voted by the Storting. The prince royal entered Christiania in the midst of acclamations, and received the oath of allegiance of the deputies to Charles XIII. in November 1814. The Scandinavian peninsula was now united under one sceptre, and 'No more Dovre' was the common word of union, meaning that the natural boundary of the Dovrefeld, or mountains between the two countries, was no longer a political barrier.

In July 1817 Prince Oscar, son of the prince royal, the present King of Sweden and Norway, attained his majority, which was celebrated by a public solemnity. This young prince, who had followed his father to Sweden in 1810, had been educated as a Swede in every respect. At the end of that year Charles XIII. fell ill, and on the 5th of the following February, 1818, he expired, happy in the choice of his adopted son. Carl XIV., Johan, was immediately proclaimed both in Sweden and in Norway, and was in due time acknowledged by all the princes of Europe. Even the deposed Gustavus wrote him a letter of congratulation from Switzerland. The new king was crowned at Stockholm in May by the Archbishop of Upsal, and afterwards at Drontheim in September by the Bishop of Aggerhus, with unusual splendour.

The twenty-six years of the reign of Charles XIV. were for Sweden and Norway a period of peace and internal improvement. Every branch of the administration, the finances, the navy, the army, the roads and canals, public instruction, all were improved. The great canal of Gotha, which joins the Baltic to the Northern Sea, was opened in 1832. Agriculture in all its branches made great progress. Sweden, which was formerly obliged to import large supplies of corn, now produces enough for itself, and even exports corn. The public debt was reduced almost to nothing. Sweden had at the end of this reign more than 2500 merchant ships, exclusive of coasting vessels, which is double what she had in 1810. It may be easily supposed that the military service, in all its branches, received the especial attention of Charles John. In his speech on the opening of the Swedish Diet in January 1846, he recapitulated with honest satisfaction all that had been done for the country under his reign.

Charles John had completed his eightieth year when he was seized by an illness in January 1844, which brought him to the grave on the 8th of March following. His son, Oscar I., succeeded him. Upon the whole, the life of Charles John Bernadotte is one of the most instructive biographies of our own times; it affords subject for serious reflection, and is a useful comment on the history of Napoleon.

(Touchard-Lafosse, *Histoire de Charles XIV. Jean, Roi de Suède et de Norvège*; F. Schmidt, *La Suède sous Charles XIV. Jean*; Daumont, *Voyage en Suède*; Laing, *Tour in Sweden*; Count Björnström, *On the Moral State and Political Union of Sweden and Norway*, &c.)

CHARLEVOIX, PIERRE FRANÇOIS XAVIER DE, born at St. Quentin in 1682, was educated by the Jesuits, and was admitted into their order in early life. In 1720 he was appointed to one of the Jesuit missions in Canada, and, embarking at Rochelle, he arrived at Quebec in the autumn of that year. He explored a large part of Canada, and examined several of the rivers and lakes, which were then not much visited by Europeans. In going from North America to St. Domingo, he suffered shipwreck; but a second voyage was more fortunate, and he reached that island in September, 1722. After two or three weeks stay in St. Domingo, he sailed for France, and arrived at Havre in the month of December. He afterwards made a journey into Italy on some business of his order, which frequently entrusted him with important employments. Besides producing the voluminous works that bear his name, he wrote during twenty-two years in the 'Mémoires de Trevoux,' a literary journal conducted by the Jesuits. He died at La Flèche in 1761.

He was a laborious compiler, and the documents and accounts of foreign countries (furnished by Jesuit missionaries, who were scattered in almost every corner of the world) upon which he principally worked, were numerous and occasionally valuable; but both he and his authorities were partial, prejudiced, credulous, and superstitious, and too much given to tedious details of the proceedings and ceremonies of their own order. His separate works are, 1, 'History and Description of Japan,' 3 vols. 12mo, Rouen, 1715; and 2 vols. 4to;

Paris, 1736; this work is taken almost entirely from Kämpfer; 2, 'History of St. Domingo,' 2 vols. 4to, Paris, 1730; 3, 'History of New France,' 3 vols. 4to, Paris, 1744, which contains a good account of the French establishments in Canada and North America; (part of this work, including his own travels in those countries, was translated into English in 1760, under the title of 'Journal of a Voyage to North America;') 4, 'History of Paraguay,' 3 vols. 4to, Paris, 1756; which was translated into English in 1769.

The thick quartos of Charlevoix are a compound of travels and history, not very skilfully mixed; but although he had neither the order and philosophy necessary to an historian, nor the enterprise and vivacity of a traveller, he was a very industrious man, and collected many things which still render his books valuable for occasional reference.

CHARNOCK, STEPHEN, a nonconformist, was known in his lifetime as an active and eloquent theologian, and is now remembered for the merit of writings not published till after his death. He was born in London, in 1628. At one time he was senior proctor in the University of Oxford; and afterwards he became a preacher in Dublin. Being ejected thence by the Act of Uniformity, he held for fifteen years the charge of a dissenting congregation in London, where he died in 1690. His printed works are the following:—'Several Discourses of the Existence and Attributes of God,' 1682, fol.; 'Works,' 1684, 2 vols. fol.; 'Two Discourses, of Man's Enmity to God; and of the Salvation of Sinners,' 1699, 8vo.

CHARON, a native of Lampascus, on the Hellespont, one of those numerous Greek historical writers now only known by their names and a few fragments. Charon lived before Herodotus, who was born B.C. 484, and he was younger than Hecateus, who was probably in the vigour of his life about B.C. 500. Charon wrote a history of his native town, a history of Persia, a history of Crete, and other works. The loss of the Cretan history is to be regretted, as we possess so few materials for the ancient state of that island.

(Suidas, *Xáρον*; Creuzer, *Historicorum Græcorum Antiquæ. Fragmenta, &c.*, Heidelberg, 8vo, 1806.)

Suidas mentions two other writers of the name; one of Carthage, and the other of Naucratis, in Egypt.

* CHASLES, MICHEL, an eminent geometer, was born at Epéron (Eure-et-Loire) 15th of November 1793. In 1812 he entered the École Polytechnique, where his researches on the theory of surfaces of the second order, to which he at once devoted himself, soon brought him into notice. They are published in the 'Correspondance sur l'École Polytechnique' for 1813 and 1816. Before then there was no other proof of the double generation of the hyperboloid of one sheet than the analytical demonstration by Monge; Chasles produced one purely geometrical, which was immediately adopted in the instructions of the school. By another class of researches he established different theorems, which were used by Poncelet in his 'Traité des propriétés projectives des Figures' (4to, Paris, 1822). In a later series of memoirs he teaches how infinitely thin laminae may be constructed, partaking of the properties of electric films formed on the surfaces of conducting bodies, by methods which give him a distinguished place among analysts. But it is in pure geometry that his power of generalisation is best seen: he at once extends and simplifies the most important theories.

The Academy of Sciences at Brussels having proposed as a prize question, "On demande un examen philosophique des différentes méthodes employées dans la géométrie récente, et particulièrement de la méthode des polaires réciproques," M. Chasles answered it by an elaborate paper which was crowned by the Academy in 1830, and published in the 11th volume of their 'Mémoires.' It was considerably amplified and reprinted by the author in 1837, under the title 'Aperçu historique sur l'origine et le développement des méthodes en géométrie, particulièrement de celles qui se rapportent à la géométrie moderne, suivi d'un mémoire sur deux principes généraux de la science, la dualité et l'homographie,' 4to, Paris. This work is not merely a learned history of different geometrical methods; in the thirty-four notes which accompany it M. Chasles approaches important questions; giving a large extension to the theory of the involution of six points which originates in one of Desargues' theorems, and establishing the basis of a new theory of conic sections and of surfaces of the second order.

Many questions in pure geometry could only be resolved by a complicated process which rendered their solution exceedingly difficult if not impossible, notwithstanding the researches of Carnot and other mathematicians. M. Chasles however by an ingenious algorithm succeeded in introducing the principle of signs into pure geometry, and showed moreover that imaginaries might be brought into consideration without difficulty. He has thus created a new branch of mathematics, characterised by the uniformity of the method. Its merits consist in the ability which it gives of deducing immediately from one single principle all those admirable properties of conic sections known as theorems of Pappus, Desargues, Pascal, Newton, Brianchon, and others; and also that it establishes a multitude of new ones by the aid of this principle, and of a certain law of correlation.

In 1841 M. Chasles was appointed professor of astronomy and of applied mechanics at the École Polytechnique. It was felt that his brilliant discoveries called for a chair specially devoted to that course of teaching, and in 1846 the chair of higher geometry was instituted

at the Faculty of Sciences. Entered on his duties in this new post, M. Chasles co-ordinated the elements of the science, and published the first portion in his 'Traité de Géométrie Supérieure,' 8vo, Paris, 1852. The method applies equally to conic sections and lines of the higher orders, as the author has demonstrated in various memoirs which are to form the groundwork of succeeding volumes.

By his historical researches M. Chasles has promoted science in another way. His 'Aperçu historique' contains new ideas on the signification of the porisms of Euclid, and an explanation of the geometrical part of the works of the Hindoos, which bear evidence of profound erudition. In the same work, and in his 'Histoire de l'Arithmétique' (4to, 1843), he shews proof that our system of numeration is of Pythagorean origin and not Arabian, as is commonly believed. Others of his writings are to be found in the 'Journal de l'École Polytechnique,' Gergonne's 'Annales de Mathématiques,' Quetelet's 'Correspondance Mathématique et Physique,' Liouville's 'Journal de Mathématiques,' 'Comptes Rendus de l'Acad. des Sciences,' 'Connaissance des Temps,' &c.

M. Chasles was elected a member of the Academy of Sciences in 1851, the same year that he commenced his lectures at the Faculty of Sciences. In 1854 he was chosen a foreign member of the Royal Society of London.

CHASSE, DAVID HENRY, BARON, the resolute defender of Antwerp, was born at Thiel, in Gueldre, March 18, 1765. In 1775, he entered the Dutch army as a cadet, but he left that service after the revolution in Holland in 1787, and attached himself to the French army, in which he continued for many years. He became a lieutenant-colonel in 1793. In the fierce war with Prussia in 1806, he greatly distinguished himself under the Dutch general Dumorcean, and was made general of brigade. He afterwards took part in the Peninsular War, and displayed so much intrepidity that the soldiers nicknamed him 'General Bayonet,' from his constant use of that weapon. In 1811, Napoleon created him a baron of the empire. He was frequently wounded, and during the campaigns of 1813 and 1814 he had several horses killed under him. He fought likewise at Waterloo. Soon after the peace he was made governor of Antwerp, and his admirable defence of the citadel in 1832, with a garrison of 6,000 troops, against an army of 75,000 French soldiers commanded by Marshal Gérard, attracted general attention throughout Europe, and made the brave old soldier very popular. He died on the 2nd of May 1849. (*Biogr. des Contemporains*; Campo, *Life of Chassé*.)

CHASTELLET, GABRIELLE-ÉMILIE LE TONNELIER DE BRETEUIL, MARQUISE DU, the translator of Newton into French, was the daughter of Baron de Breteuil, and was born in 1706. In what manner she was led to study mathematics is not stated; she also became a proficient in Latin, English (in which Voltaire, as he tells us, was her instructor), and Italian. She was married very early to the Marquis du Chastellet-Lomont, a lieutenant-general of a distinguished family of Lorraine. In 1733 she retired to the castle of Cirey, on the borders of Champagne and Lorraine, where she pursued her studies for several years. She died August 10, 1749, her death having been hastened by close application to her translation of Newton. She died in the palace of Luneville, at the court of Stanislas, where her husband filled the office of high steward, and where Voltaire also was then residing. Her liaison (as the French call it) with Voltaire furnished sundry anecdotes for the scandalous chronicles of her day. The state of manners however, and in particular the light in which the marriage contract was regarded among the French, are too well known to require any comment.

In 1738 Madame du Chastellet wrote, for the prize of the Academy of Sciences, on the nature of fire. In 1740 she published at Paris her 'Institutions de Physique,' addressed to her son, and a second edition appeared at Amsterdam in 1742. This work is a series of letters, in which the systems of Leibnitz and of Newton (the latter then almost new in France) are explained in a familiar style, and with a degree of knowledge of the history of the several opinions, and of sound language and ideas in their discussion, which we read with surprise, remembering that they were the production of a Frenchwoman thirty years of age, written very few years after the introduction of the Newtonian philosophy into France. She takes that intermediate view between the refusal to admit the hypothesis of attraction, and the assertion of it as a primary quality of matter, from which very few who consider the subject would now dissent. At the end of this work is an epistolary discussion with M. de Mairan, on the principle of "vis viva," the metaphysical part of which then created much controversy.

The translation of Newton was published at Paris in 1759, with a "préface historique," and an eloge in verse by Voltaire, who probably owed to Madame du Chastellet the smattering of knowledge upon which he wrote his 'Eléments de la Philosophie de Newton,' published in 1738. From it we learn that the translation was submitted to the revision of Clairaut, who was the instructor of the authoress in mathematics. To the work is added a commentary, which bears the name of Clairaut, being in fact his lessons committed to writing and arranged by Madame du Chastellet, and afterwards revised by their author. We here find, 1, a popular account of Newton's system; 2, investigations of various points by the analysis of the continental school, to the exclusion of the geometry of Newton; 3, an abridg-

ment of Clairaut's work on the figure of the earth; 4, another of Daniel Bernouilli's essay on the tides. The translation itself is a close copy of the original in form and matter, but does not profess to be perfectly literal, where the Latin is concise or obscure. It was used by Delambre in his citations ('Hist. d'Astron.' xviii. siècle), expressly that he might have the sanction of Clairaut in his versions of Newton. In 1804 the correspondence of Madame du Châtelet with the Count d'Argental was published at Paris, to which was appended a life, and a treatise 'Sur le Bonheur.'

(*Diog. Univ.; Mémoires pour servir à la Vie de Voltaire, écrits par lui-même; le Vie de Voltaire, par Condorcet.*)

CHATEAUBRIAND, FRANÇOIS RENÉ, VISCOUNT DE, the most celebrated French writer of the Napoleon era, was born at St. Malo on September 4th, 1768, being the youngest of ten children. He was at first intended for the church, but after a careful education for that calling, he entered the army as sub-lieutenant in 1786. After various adventures he appears to have visited Paris shortly before the Revolution, and to have witnessed the capture of the Bastille in 1789. His erratic disposition took him to America in 1791, to look for the North-West passage. He spent several months in the States, had an interview with Washington, visited the falls of Niagara, and roamed through those virgin forests and wild scenes of primitive life which he has described so vividly in 'Réné' and 'Atala.'

On his return home he joined the army of Condé for a short time in 1792, and the next year he began a life of great misery as an emigrant in London, amidst a group of exiled nobles, equally wretched. The picture of his sufferings and privations at this time, as he relates them in his 'Mémoires,' is almost incredible. Nevertheless he continued in England nearly eight years, maintaining himself by translating for the booksellers, and giving lessons in French and Latin. In 1797 he published in London his 'Essay on Revolutions,' a work full of scepticism; but the death of his mother in 1798 gave a new direction to his thoughts, and restored his faith.

In the spring of 1800 he went to Paris, and his excellent friend, M. Fontanes, whose influence was already strong, had been appointed one of the editors of the 'Mercure,' in the columns of which 'Atala' appeared for the first time. This romance was followed by the 'Génie du Christianisme' in 1802, which made a deep impression on the public mind. The First Consul was so pleased with this work that he took the author into favour, and strove to bend him to his service by two successive employments. Unfortunately the execution of the Duke d'Enghien, on the 21st of March 1804, furnished the inflexible Breton with too just an excuse, and he resigned his appointment the same day. Fontanes, Madame Bacciochi, and even Josephine herself could scarcely prevent the consequences of this rash act from falling upon the viscount.

The reign of Napoleon, which lasted ten years (1804-14) was not favourable to literature, and during this period Chateaubriand produced nothing of note, save the 'Martyres' in 1807, and the 'Itinéraire à Jérusalem' in 1811: the latter was the account of his own visit to the Holy Land in the autumn of 1806. The fall of the empire in 1814 released his pen, and he produced his famous pamphlet, 'De Bonaparte et des Bourbons,' the influence of which in disposing the public mind to welcome the returned family was so powerful, that "it was equal," said Louis XVIII., "to an army of 100,000 men." The viscount was now received with great favour at the Tuilleries, but he refused office as a colleague with Fouché; and other circumstances delayed his entrance into public life until 1822, when he was sent as ambassador to the British court, and most honourably greeted by all classes of people. The next year he was appointed Minister of Foreign Affairs, which office he held during the war in Spain conducted by the Duke of Angoulême. In 1824 the minister Villèle dismissed him rather abruptly. Then, and for the next three years, Chateaubriand led the opposition against the government with merciless rancour both in pamphlets and newspapers, never desisting till it crumbled beneath his blows. In 1828 M. de Martignac gave him the embassy to Rome; but no sooner had the Polignac ministry been formed (August 8) than he sent in his resignation.

In 1830, after the fall of the monarchy, which he had assisted to destroy, this inexplicable man, whom the people claimed as their leader, and followed with acclamations, deliberately resigned his titles, his offices, his very means of subsistence, to rally to that cause which had no other supporter. A singular change came over his spirit; he sank into despondency, and a gloom, which deepened every year, almost extinguished his noble mind. This crisis was so contagious that his most faithful friends shrank from it. This sad state of mind is very visible in the last of his works, which appeared about the time of his death—'les Mémoires d'Outre Tombe'—the reading of which is most painful. He died July 4, 1848. His character has been well summed up by a recent French writer:—"It was almost invariably the fate of M. de Chateaubriand to lead a party whose ruling principle was not his; so that at the very time he was crushing his adversaries, he had no influence over his friends."

(*Mémoires d'Outre Tombe; Biographie Universelle; Dict. de Conversation.*)

CHATHAM, EARL OF. (Pitt.)

CHATTERTON, THOMAS, was born at Bristol on the 20th of November 1752. His father (who died three months before the

birth of his son) was sexton at Redcliff church, and also master of a charity school in Pile-street. At the age of five years he was placed under the care of Mr. Love, who succeeded his father in the school; but his progress was so slow, that after his master had exhausted his patience in attempting to teach him, he sent him back to his mother as a "dull boy, and incapable of further instruction." His mother now took him under her care, and at the age of six years he first learned his letters from the illuminated capitals of an old French musical manuscript, with which, to use her expression, he "fell in love;" and it is probable that his passion for antiquarian pursuits received its first impulse from this circumstance. His progress was now as rapid as it had before been slow; books of all kinds, but more especially those which treated of ancient customs, were his chief companions. On the 3rd of August 1760, when not quite eight years of age, he was admitted into Colston's school, Bristol, an establishment somewhat similar in plan with Christ's Hospital, in London. He remained there seven years, during which time he wrote some minor pieces of poetry, chiefly satirical, and the celebrated De Bergham pedigree. On the 1st of July 1767, he left the charity school, and was bound apprentice to Mr. John Lambert, attorney of Bristol, for seven years. In the beginning of October 1768, the new bridge at Bristol was completed, and at that time there appeared in Felix Farley's 'Bristol Journal' an article purporting to be the transcript of an ancient manuscript, entitled, 'A Description of the Fryars first passing over the Old Bridge, taken from an Ancient Manuscript.' This paper, so singularly curious, and exhibiting such strong powers of invention, was traced to Chatterton, who was at first rather harshly interrogated as to the manner by which it came into his possession. After several contradictory statements, he asserted that he had received the paper in question from his father, who had found it, with many others, in some chests in Redcliff church, where they had been deposited in the muniment room in "Canyng's cofre." Soon after this occurrence he became acquainted with Mr. Catcott, a gentleman fond of antiquarian researches, and with Mr. Barrett, surgeon, who was engaged in writing a history of Bristol. To the former gentleman he took, very soon after his introduction to him, some of the pretended Rowleian poems, among which were 'The Bristow Tragedy,' 'Rowley's Epitaph upon Mr. Canynge's Ancestor,' with some other small pieces. This Rowley, according to Chatterton, was a priest of the 15th century, who had been patronised by Canynge. He shortly afterwards presented to Mr. Catcott the 'Yellow Roll.' To Mr. Barrett he furnished an account of every church and chapel in Bristol, which he stated to have been found by him among the old parchments. The pretended originals bore all the marks of antiquity, which he had made them assume by rubbing them with ochre, stamping on them, and blacking them in the chimney, or by the flame of a candle. Mr. Barrett published these statements in his work, fully believing them to be genuine. After his introduction to these gentlemen Chatterton's ambition increased daily, and he often spoke in raptures of the undoubted success of the plans that he had formed for his future life. His pursuits were various—heraldry, English antiquities, metaphysics, mathematics, astronomy, music, and physics, by turns occupied his attention; but the two first were his favourite pursuits. About this time he also wrote various pieces, chiefly satirical; and several essays, both in prose and verse, which he forwarded to the periodicals of the day. Most of his pieces appeared in the 'Town and Country Magazine.' Growing disgusted with a profession ill suited to his tastes, and with a master whom he disliked, he made an application in March 1769, to Horace Walpole, the ground of which was an offer to supply him with some accounts of a succession of painters who had flourished at Bristol, which Chatterton affirmed to have been lately discovered, with some old poems, in that city. Walpole accepted the offer with warmth, but afterwards seemed to have cooled upon it, probably from suspecting the forgery of the accounts, or ascribing but little value to them; and on being importuned by Chatterton for his assistance to release him from his profession, neglected to answer his letters. At last, when he had received a spirited letter from Chatterton, demanding his manuscripts (a letter which he termed "singularly impertinent"), Walpole returned the manuscripts with Chatterton's letters in a blank cover.

Being determined to relinquish his profession, Chatterton made every effort to accomplish this object. The idea of suicide became familiar to his mind, and he often intimated to Mr. Lambert's servants that he would put an end to his existence. On hearing this the family of his master became alarmed; but Mr. Lambert himself could not be persuaded that his threats meant anything, until he found one day on his desk a paper entitled, 'The last Will and Testament of Thomas Chatterton,' and couched in terms which appeared to indicate an intention to destroy himself. Mr. Lambert now considered it imprudent to keep him any longer, and accordingly he dismissed him after he had been in his service about two years and nine months.

Chatterton went up to London, having received liberal offers from the booksellers. "My first attempt," said he, "shall be in the literary way: the promises I have received are sufficient to dispel doubt; but should I, contrary to my expectation, find myself deceived, I will in that case turn Methodist preacher. Credulity is as potent a deity as ever; and a new sect may easily be devised. But if that too should fail me, my last and final resource is a pistol." His first letters from

London to his mother and sister are full of enthusiasm. "I am settled," says he, "and in such a settlement as I can desire. What a glorious prospect!" Party-writing seems to have been one of his favourite employments, and it would appear that he did not confine himself to one side. This kind of writing was agreeable to his satirical turn, and by raising him into immediate notice gratified his pride, which was unbounded. When recommended by a relation to get into some office, he stormed like a madman, and asserted that "he hoped, with the blessing of God, very soon to be sent prisoner to the Tower, which would make his fortune." His writings during his residence in London were numerous and of varied character, from sermons to burlettas for Vauxhall; but they failed to procure him a comfortable income, and he was plunged from the highest pinnacle of hope to the depths of despair. In the month of July 1770 he removed from Shoreditch, where he had lodged, to an apartment in Brook-street, Holborn, where, on the 24th of August following, being literally in a state of starvation, he terminated his existence by poison. He was buried on the following day in the burying-ground of Shoe-lane work-house.

Chatterton was only seventeen years and nine months old when he died. The person of Chatterton was, like his genius, precocious. One of his companions says he looked "like a spirit." His eyes were uncommonly piercing, and one more so than the other. His habits were domestic, and his affection for his relatives unbounded. The controversy as to the Rowleian poems engaged numerous writers of the day; but few people now believe the Rowley poems to be anything else than the production of Chatterton himself. Of his genius there can be little doubt. His poetry has immaturity of thought stamped upon every stanza, but as the poetry of a boy it is often wonderfully fine. Had he had a better training and lived under happier circumstances, he might, unless the taint of insanity had been ineradicable, have come to be one of the first poets of his time.

CHAUCER, GEOFFREY, a very distinguished name in the long catalogue of eminent Englishmen, and one who, in the words of Hallam, "with Dante and Petrarch filled up the triumvirate of great poets in the middle ages." Geoffrey Chaucer was born in London in 1328, and was educated at Cambridge and Oxford. He studied the law in the Inner Temple. He lived much in the court of Edward III., and in familiar intercourse with several members of his family. He was also employed in the public affairs of the realm. But it is as a writer, and especially as a poet, that he claims the notice of posterity. Chaucer wrote in the vernacular language of his own age and country; he refined it indeed, but neither his labours, nor those of his contemporaries, Langland, Gower, and Wicliffe, were able to fix the language. The English of Chaucer is so unlike the English of our time, that few persons can read it with ease, and none without the assistance of a dictionary. Yet a little pains would enable any one to master his language and versification, and the pains would be amply rewarded, for his writings are valuable not only as illustrating the manners and habits of the time, but as the productions of a mind eminently poetical. His chief work is a collection of stories, entitled by him 'Canterbury Tales,' being a series of tales told by the individuals of a party of pilgrims going from Southwark to Canterbury, who had agreed thus to beguile the tediousness of the way.

While at the university Chaucer produced two of his larger works, the 'Court of Love' and 'the book of Troilus and Cresseide'; but he soon entered on public life. He married Philippa, an attendant on Queen Philippa: his older biographers state that she was the daughter of Sir Payne Roet of Hainault, and sister of Katherine Swinford, who was subsequently married to John of Gaunt. This has indeed been doubted, but as appears to us without sufficient reason.

In 1358 John of Gaunt married Blanch of Lancaster. It was on occasion of this suit or courtship that Chaucer wrote his 'Parliament of Birds.' In the next year Chaucer appears as a soldier. One of the most authentic and interesting memorials we possess of him is a deposition given by him in the suit between Scrope and Grosvenor, on the question of right to a particular figure in their coat-armour. The depositions are preserved on the rolls at the Tower. Chaucer deposes among other things that he was in the expedition of 1359, when Edward III. invaded France, and was then made prisoner by the French near the town of Retters. How long he remained in captivity is not known, and it is not till 1367 that we meet with him again in the national records. In that year he had an annual pension of 20 marks granted to him, a sum which his biographer, Mr. Godwin, estimates as equivalent to 240*l.*: the grant is entered on the patent rolls; there is proof of the payment of it in the issue roll of the Exchequer of the 44th year of Edward III., and also of the payment of 10 marks a year, granted to Philippa Chaucer, his wife.

In 1369 he wrote 'the Book of the Duchesse,' a funeral poem, on the death of Blanch, duchess of Lancaster. From the national records we find that in 1370 Chaucer had letters of protection, being about to depart beyond sea. In 1373 he was in an embassy to Genoa, to treat on some public affairs. On this visit to Italy it seems probable that he saw and conversed with Petrarch, of whom he speaks in the induction to one of his tales. On his return he had a royal grant of a pitcher of wine, to be taken daily at the port of London, and was soon after made comptroller of the customs in that port. He is found also on the rolls as having a grant of a wardship in 1375, and another

of a portion of contraband wool in 1376. About this time it is supposed that he wrote the poem which Pope afterwards modernised, called by him the 'House of Fame.'

In both 1376 and 1377 he was employed in embassies of a secret character, the object of neither of which is known. On the accession of Richard II. he was sent to negotiate a marriage between Richard, prince of Wales, and Mary of France, daughter of the French king. In the following May he was sent to Lombardy to negotiate with the Duke of Milan, and it is noteworthy that Gower the poet was one of the two persons whom Chaucer left to act as his representatives in England during his absence.

King Edward III. died in May 1377. To the early years of his successor are referred Chaucer's poems entitled 'The Black Knight,' 'The Legend of Good Women,' and 'The Flower and the Leaf.' Mr. Godwin and others have laboured to prove that Chaucer was in disgrace and misery during much of the period from 1384 to 1389. He is represented as having been implicated in the affairs of John de Northampton, in his struggle for the mayoralty of London, and to have been in consequence driven into exile, flying to Hainault, and afterwards to Zealand, and on his return to England being imprisoned in the Tower, whence he was not released but at the expense of some disclosures, which are said not to have been creditable to him. But Sir Harris Nicholas has shown that from 1380 to 1388 Chaucer regularly received his pension with his own hands, which of course disposes at a blow of the hypothesis of his exile. It is to be remarked further, that in 1386 he was returned a knight of the shire for Kent. But there is no doubt that about this time he fell into adversity. His offices were taken from him, probably on account of his being regarded as one of the followers of John of Gaunt, who was then in disgrace; and as a Wicliffite he perhaps met with some persecution. In 1388 he was constrained to sell his two pensions: his wife had died in 1387, and her pension had of course ceased with her life. In 1389 he appears to have regained at least a measure of court favour, as he was then appointed clerk of the works at the king's palaces, and the repairs at Windsor were executed under his direction. This office he however held for only two years. After this—from 1394 to 1398—he appears to have been suffering from great pecuniary distress; but Bolingbroke, immediately on his accession to the crown (1399), conferred on Chaucer a pension double that he had formerly enjoyed, so that we may hope his last days were spent in comfort.

In the last ten years of his life he seems to have lived retired from public affairs, though receiving from time to time marks of royal favour. A house at Woodstock, which had been assigned to him by the king, and the castle at Donnington, near Newbury, are believed to have been at this period his usual places of abode. In this part of his life it was that he wrote the 'Canterbury Tales,' and the tradition, both at Woodstock and at Donnington, is, that portions of the work were written at those places. Chaucer died in London, October 25, 1400, and was buried in the Abbey Church of Westminster. The monument there erected to his memory was a tribute paid to him a century and a half after his decease by Nicholas Brigham.

Chaucer had two sons, Sir Thomas and Lewis. Sir Thomas was speaker of the House of Commons, and, marrying an heiress of the house of Burghersh, obtained with her Ewelme in Oxfordshire, and other possessions. He had an only daughter, Alice Chaucer, who married De la Pole, duke of Suffolk.

The 'Canterbury Tales' were printed by Caxton, but it was not till 1542 that any general collection of his writings was made and committed to the press: they have been often reprinted. Mr. Tyrwhitt's edition of the 'Canterbury Tales' is justly celebrated for the purity of the text, which was far superior to that of any previous edition and for the valuable illustrations which he has annexed.

We have noticed in this article Chaucer's principal works, without professing to enumerate all. Chaucer was the first great English poet, and he remained the greatest English poet till that place was taken by Shakspeare. In sublimity and grandeur of thought he has been excelled, but in liveliness of imagination, vigour of description, vivacity, and ease, he has few rivals; and, we may add with Hallam, that "as the first original English poet, if we except Langland—as the inventor of our most approved measure—as an improver, though with too much innovation, of our language—and as a faithful witness to the manners of his age, Chaucer would deserve our reverence, if he had not also intrinsic claims for excellences, which do not depend upon any collateral considerations."

CHAUDÉT, ANTOINE DENIS, a celebrated French sculptor, born at Paris, in 1763. He was the pupil of Stouff, and in 1784 he obtained the grand prize of the Academy for sculpture, by a bas-relief 'Joseph sold by his Brethren.' He studied some time in Rome, and returned to Paris in 1789, when he was elected an Agrégé of the Academy of Painting and Sculpture, of which he became later a member and professor of sculpture. He was made a member of the Institute in 1805, and took part in the preparation of the 'Dictionary of the French Academy'; he edited the 'Dictionnaire de la Langue des Beaux Arts.' He died in 1810.

There are several excellent works by Chaudet in public buildings of Paris, but one of his chief performances, the colossal bronze statue of Napoleon in the heroic or Roman costume, which stood on the column of the Place Vendôme, was melted down in 1814 by the

government of Louis XVIII., and the medal was used to form part of the horse of Henri IV. on the Pont Neuf. Chaudet was likewise a possessor of considerable merit, and his widow, Madame Chaudet, also distinguished herself as a painter and portrait painter.

CHAUVEAU LAGARDE, CLAUDE FRANÇOIS, was born at Chartres, in 1767, and like Robespierre, had acquired a respectable name as a lawyer before the revolution. He continued to practise during those days of anarchy, and in the beginning of the Reign of Terror, his eloquent defence saved General Miranda from the scaffold. But in his pleading for the Girondist Brissot, he was less fortunate. His famous defence of Charlotte Corday startled the judges, and his enthusiastic client interrupted him, to disclaim any apology which might throw doubt on her design and motive. He was likewise the advocate for Madame Roland, and assisted her in preparing her defence; but she would not allow him to venture his life by appearing to plead for her in court. After the trial of Marie Antoinette, in whose cause he was likewise retained, the fearless advocate was thrown into prison, where he remained until released by the fall of Robespierre (July 28, 1794). In 1806 Napoleon made him an advocate of the Council d'Etat; and in 1814, Louis XVIII. gave him a patent of nobility. Historians will do well to consult the narratives which he published in 1816, of the trial of Marie Antoinette and that of Madame Elizabeth. Chauveau Lagarde, maintaining to the last his character as a firm and upright man, died at Paris on the 20th of February 1841, aged 77.

CHEKE, SIR JOHN, a learned writer of the 16th century, descended from an ancient family in the Isle of Wight, was born at Cambridge, June 16, 1514. He was admitted into St. John's College, Cambridge, in 1531, where his early studies were chiefly directed to the Latin and Greek languages, the latter of which was then almost universally neglected. After taking his degree in arts, he was chosen Greek lecturer of the university, and about 1540 became the first professor of Greek in the university, upon King Henry VIII's foundation. He was highly instrumental in bringing the language into repute, and directed his attention more particularly to reform and restore, what he considered, the original pronunciation of it. Cheke, while professor, was at the same time University Orator. In 1543 he was incorporated M.A. at Oxford, where he also studied for a short time; and in 1544 was sent for to court, to be made joint-tutor for the Latin tongue with Sir Anthony Cooke to Prince Edward. He seems also to have had the Lady Elizabeth for some time under his care. About 1544 too he became a canon (it is most probable a lay canon, for there is no proof of his having taken orders) of King Henry VIII's first foundation of the college in Oxford, which has been since called Christ Church; but upon the dissolution of that foundation in 1546, he was allowed a pension in the room of his canonry. When Edward VI. came to the throne he rewarded Cheke with an annuity of a hundred marks, and made him one or two favourable grants in purchase of monastic property. In 1548 he had a grant of the college of Stoke by Clare, in Suffolk, and in the year following the house and site of the priory of Spalding in Lincolnshire; but surrendered his annuity upon receiving the latter grant. The king likewise caused him, by a mandamus, to be elected provost of King's College, Cambridge. In 1550 he was made chief gentleman of the king's privy chamber, and in 1551 received the honour of knighthood. About this time he was engaged in various conferences and disputations, on the Protestant side, on the subject of the sacrament, transubstantiation, &c. In 1552 he became clerk of the council, and soon after one of the secretaries of state, and privy councillor. This was the height of Sir John Cheke's fortunes. His zeal for the Protestant religion induced him to approve of the settlement of the crown upon Lady Jane Grey; and he acted for a very short time as secretary to her and her council after King Edward's decease. Upon Mary's accession to the throne he was committed to the Tower, and an indictment was drawn up against him; but he remained in prison, and the year following, having been stripped of his whole substance, received a pardon, and was set at liberty September 3, 1554. Foreseeing the days of persecution, he obtained a licence to travel for some time, and went to Basel, and thence to Italy. At Padua he renewed his Greek studies; and afterwards, in his return from Italy, settled at Strasbourg, where he read a Greek lecture in order to obtain a subsistence. In the beginning of 1556 he came, by a treacherous invitation, to Brussels, though under misgivings, which were only allayed by the consultation of astrology, a pseudo-science to which Sir John Cheke was unfortunately attached, and which upon this occasion deluded him. Between Brussels and Antwerp he was seized by order of Philip II., blindfolded, thrown into a waggon, conveyed to the nearest harbour, put on board a ship under hatchets, and brought again to the Tower of London. The desire of gaining the reconciliation of so eminent a man to the church of Rome had been the inducement to his arrest, and now led the queen not only to send two of her chaplains, but Dr. Fockenham, at that time dean of St. Paul's, to endeavour to convert him. The chaplains had no success with their arguments; but Fockenham's were brought into a narrower compass, he said, "Either comply or burn." Cheke could not withstand the dreadful alternative. On July 15, after a previous negotiation with Cardinal Pole, he wrote to the queen, and declared his readiness to obey her laws and other orders of religion. He afterwards not only

made his solemn submission before the cardinal, but on the 4th of October made a public recantation before the queen, and after that before the whole court. Upon these mortifications his lands were restored to him, but upon condition of an exchange with the queen for others. He was compelled to be present at the examinations and convictions of Protestants, and in various ways to make a public display of his adoption of the new principles. Remorse and vexation however sat at last so heavy on Cheke's mind, that he pined away with shame and regret. He died September 13, 1557, at the age of forty-three. Some of Sir John Cheke's works are in very elegant Latin; but few of them would suit the reading of the present day. Still he was one of the most learned men of his age, one of its greatest ornaments, and one of the revivers of polite literature in England.

(Strype, *Life of Cheke*, 8vo, Lond., 1705; *Biogr. Brit.*, old edit., vol. ii. p. 1309; Bliss, edit. of Wood's *Athena Oxonienses*, vol. i. p. 241; Chalmers, *Biogr. Dict.*, vol. ix. p. 225.)

CHEMNITZ, MARTIN, the most eminent of the Protestant divines of the 16th century, after Luther and Melancthon, was the son of parents in an humble condition of life. He was born at Treunbrietsen in the Mark of Brandenburg, on the 9th of November 1522. He received his education at Magdeburg and at Frankfurt-on-the-Oder, and in 1544 occupied the place of a schoolmaster at Writzen-on-the-Oder: he devoted the small salary which he derived from it, in the following year, to the prosecution of his studies at Wittenberg. By the advice of Melancthon he applied to mathematics and astronomy, and in 1547 went to Königsberg, where he obtained in 1548 the place of Rector in the Cathedral School. He composed the calendar for 1549-50, and having been recommended for his astronomical knowledge to Duke Albert of Prussia, was appointed his librarian. From that time forward theology became his principal study. In the disputes of Osiander, on the doctrine of justification, he took part with Morlin against him; but this affair caused him so much vexation, that he requested and obtained the duke's permission in 1553 to return to Wittenberg to pursue his theological studies. Here he delivered lectures on Melancthon's 'Locci Communes,' from which his own 'Locci Theologici,' published by Leyer (Frankfurt, 1591, folio), arose, and which form a commentary on the doctrines of Melancthon, which is superior to all other works of the kind of that age, and is still of permanent value. In 1554 he obtained the situation of pastor at Brunswick, and attacked the Jesuits by an exposition of their dangerous doctrines in his 'Theologie Jesuitarum præcipua Capita' (Leipzig, 1562). On the publication of a defence of the order of the Jesuits and of the Council of Trent by the Portuguese Jesuit, Didaeus de Paiva de Andrada, he took occasion to subject the resolutions of that council to a severe examination. Hence arose his 'Examen Concilii Tridentini' (4 vols., Leipzig, 1565, 8vo; the best edition is that of Frankfurt, 1707, folio). The 'Examen' is a work full of historical information, and as a solid refutation of the Roman Catholic doctrines it has not been surpassed by any subsequent publication. The sound judgment, the clear and easy yet serious and impressive style, and the spirit and moderation manifested in his work, caused even the Roman Catholics to admire and commend him. With equal approbation Chemnitz defended Luther's doctrine of the Lord's Supper against the Calvinists in his 'Repetitio sanæ Doctrinæ de vera Præsentia Corporis et Sanguinis Domini in Cœna Sacra' (Leipzig, 1561). He also took a decided part in fixing the doctrines of the Protestant church. In conjunction with Morlin he compiled at Königsberg, in 1566, the 'Corpus Doctrinæ Prutenicæ,' which acquired great authority among the Protestants in Prussia. Having become superintendent of the diocese of Brunswick in 1567, he drew up a creed for the churches of Lower Saxony, which was adopted in 1571 at the Convention of Wolfenbüttel; and from 1573 he exerted himself, with Jacob Andrea, to induce the churches of Saxony and Suabia to adopt the 'Formula Concordiæ,' which was introduced in Upper and Lower Saxony, Suabia, and Franconia, as a rule of faith. He devoted himself almost exclusively to this work; took with Andrea a leading part in all the meetings that were held on the subject; and obtained the admiration of his contemporaries as well by the prudence and firmness of his conduct as by the depth and extent of his knowledge. Having resigned his office in 1585, he died at Brunswick on the 8th of April 1586. The 'Harmony of the Gospels,' which he had begun, was completed by Leyer and Joh. Gerhard.

Chemnitz was so highly esteemed by his contemporaries that, after his settling at Brunswick, he received offers of important situations from Frederick, king of Denmark; from the electors Louis of the Palatinate, Augustus of Saxony, and John George of Brandenburg, likewise from Duke Albert of Prussia and the Protestants in Austria; but he was satisfied with his situation, and declined them.

(Brockhaus, *Conversations-Lexikon*; *Die Kirchen Historie*, 2 vols. 4to, Jena, 1735.)

CHÉNIER, ANDRÉ-MARIE DE, was born at Constantinople, Oct. 22, 1768, where his father was consul-general of France. The family having returned to France in 1773, André was placed at the Collège de Navarre in Paris, and went through a long course of study with signal success. In Greek particularly he excelled; and he became passionately fond of ancient literature. His studies having injured his health, he was advised to travel. First he visited Switzerland, in 1785; then England, in 1786, as attaché to the embassy of M. de la Luzerne.

Finally, in 1788, he returned to Paris, and devoted his fine talents to poetry for the rest of his life. His first essays were eclogues; they were very beautiful, and, though less known, are quite equal to those of Delille. "His projected labours," says Rabbe, "were vast, and he had laid the plans of numerous poems. Admiring the majesty of the Bible as much as he did the simple strength of the Greek, he had chosen his subjects as well from the sacred writings as from the mythological themes of Hesiod; so conscious was he of his own powers, that he wanted to embrace the poetry of every age, and the whole circle of nature's beauties." When the revolution broke out, André Chénier took a middle course, as far removed from anarchy as from despotism. He did not conceal his sentiments, and was soon suspected by the Jacobins. During the preparations for the king's trial, he wrote to the venerable Malesherbes, and offered to share the responsibility of his defence. He then became a marked man, and had to conceal himself. He was soon after arrested, was forgotten, and might have escaped; but his father's anxiety to save him recalled attention to his name, and he was brought before the Revolutionary Tribunal. Even in prison, and after his sentence, he composed passages of true poetry. He was guillotined on the 7th Thermidor (July 26) 1794, two days before Robespierre and St. Just. Although the poems of André Chénier are not generally read, they have certainly served to form the present school: Chateaubriand, Barthélémy, Casimir Delavigne, Victor Hugo, and Lamartine, owe much of their early inspiration to him.

MARIE JOSEPH CHÉNIER, brother of André, was born at Constantinople, on the 28th of August 1764. He became famous as a member of the Convention, and as the author of several tragedies, written in conformity with the spirit of the times. Among these, his 'Charles IX,' which still keeps the stage, was the most successful. It appeared November 4, 1789. He also produced 'Tibère,' 'Henri VIII,' and 'Caius Gracchus;' the last in 1792. In 1794 he had the courage to paint the character of a true patriot in 'Timoleon,' his finest tragedy; but the Committee of Public Safety stopped the performance, and ordered the manuscript to be burnt. Marie Joseph was an elegant prose writer, and a tolerable satirist. He likewise produced several lyrical poems. Being a good speaker, and possessing much self-command, he was elected a member of every legislative assembly from 1792 to 1802. He was also a member of several learned institutions. The report which was spread after the execution of his elder brother, André, that Marie Joseph had contributed to his fall, was the reverse of the truth; but the charge preyed upon his mind, and caused him bitter anguish for the rest of his life. He died January 10, 1811.

(*Biog. Univers.*; Rabbe; Lamartine, *Girondists*.)

CHERUBINI, MARIA-LUIGI-CARLO-ZENOBI-SALVADOR, was born in Florence in 1760. At nine years of age he commenced the study of composition under the two Felicis, father and son, both of whom dying, he was transferred, first to Bizzari, and afterwards to Castrucci. In 1778 he composed a mass and a motet, which excited a great sensation in his native city; and during the five following years he produced many other works, both for the church and the theatre, which met with decided success. This attracted the notice of the grand-duke Leopold II. of Tuscany, who in 1778 granted him a pension, and enabled him to complete his studies under the celebrated Sarti, at Bologna, with whom he passed nearly four years, not only receiving much valuable instruction from that master, but also assisting him in filling up his scores, a practice to which, under such superintendence, his skill in this branch of composition may in great measure be attributed. In 1784 he was invited to London, where he continued two years, and composed his operas 'La Finta Principessa,' and 'Giulio Sabino,' in the latter of which the famous music Marchesi made his début at the King's Theatre. In 1786 Cherubini quitted London to settle in Paris, and France thenceforward became his adopted country and the scene of his greatest triumphs. He however occasionally visited Italy, and in 1788 brought out his 'Ifigenia in Aulide' at Turin. Returning to Paris in the same year, he gave, at the Académie Royale, his 'Demophoon.' The opera of 'Lodoiska' was produced in 1791, at the Théâtre Feydeau, an event that forms an epoch in the annals of the comic opera. 'Lodoiska' was succeeded by 'Elisa,' 'Médée,' 'Les deux Journées,' 'Anacreon,' and 'L'Hôtellerie Portugaise.' In 1805 Cherubini was invited to Vienna, and there brought out, at the Imperial Theatre, his 'Faniaka.' His fame now became European, and in 1815 he was invited to London by the Philharmonic Society, for which he composed an overture, a symphony, and a grand concerted vocal piece, all of which were performed under his own direction at the concerts of that distinguished society. They were however but moderately successful, though they certainly exhibit the pen of a master. Finding himself injured by the changes making by the restored dynasty in the musical as well as the other government establishments of Paris, Cherubini resigned some of his situations in disgust; but he was soon recalled, and became composer of the Chapelle du Roi, Professor of Composition at the École-Royale (of which in 1822 he was made Director), a member of the Académie Royale des Beaux Arts, and Chevalier of the Legion d'Honneur. His last theatrical work was 'Ali Baba,' a grand opera, produced in 1833, but, though received with every mark of respect by the French public, it did not keep possession of the stage. He died in March 1842, and his obsequies were celebrated in a most solemn and distinguished

manner. His own fine 'Requiem,' the last composed of his masses, was performed on the occasion.

In instrumental music Cherubini's fame has spread throughout Europe. But it is in the field of sacred music that his genius expanded in its full dimensions. His masses, psalms, motets, &c., unite the most learned construction and the charms of the most original and sweetest melody. His mass 'A Trois Voix' is a masterpiece, and of itself sufficient to ensure the composer great and lasting reputation. Of his secular vocal works, we only need mention his admirable finale to 'Les deux Journées,' of which M. Castil-Blaze has given so picturesque a description and so laboured an analysis in his work on the French opera. The other compositions of this great artist are too numerous to be even named here.

CHESELDEN, WILLIAM, a distinguished surgeon and anatomist of the last century, was born in Leicestershire, in 1688. At fifteen he commenced his medical studies in London, under the best instructors; and began himself to give lectures in anatomy in 1711, which he continued for twenty years with a reputation not far inferior to that of his master, Cowper. Becoming soon favourably known, he was elected a fellow of the Royal Society in 1712, and repaid this early distinction by a variety of interesting papers in the 'Philosophical Transactions.' The most remarkable of them, communicated in 1728, is an account of the sensations of a youth of fourteen, blind from infancy, on recovering his sight by the formation of an artificial pupil. The memoir has been much quoted by metaphysical writers: the operation, now common, was then perfectly new; and added considerably and justly to Cheselden's fame.

In 1718 he published a work on anatomy which was long the textbook of that science in England, and was frequently republished both before and after his death. The eleventh edition was printed in 1778. On the retirement of his tutor, Mr. Ferri, Cheselden succeeded him as surgeon to St. Thomas's, and was afterwards appointed consulting surgeon to St. George's and the Westminster hospitals. He turned these opportunities to good account in maturing his own skill and advancing the science of surgery, which is largely indebted to him. He was probably never surpassed in dexterity and success as an operator; his coolness never deserted him; and he is said to have been as much distinguished for the tenderness as for the judgment that directed his hand. We are told that out of forty-two patients whom he cut for the stone in four years, he lost but one; the present average being at least six in that number. It is in lithotomy that Cheselden has most repute as an innovator as well as an operator. In 1723 he published a volume on this subject, recommending an improved method of performing what is called the 'high' operation; but after more experience and investigation, he laid it aside for the 'lateral' method, of which, as practised of late years, he may almost be considered the inventor. His splendid work on the bones was published by subscription in 1733, with a dedication to Queen Caroline, to whom he held the appointment of surgeon. It consists of a series of plates of the natural size, with short descriptions; and was then unequalled in execution, and unsurpassed in accuracy. It was not successful as a speculation, and was attacked with bitterness by a lithotomist of the name of Douglas.

In 1737, after a brilliant professional career, and, it is said, partly in disgust at the asperity to which his success had exposed him, Cheselden retired from practice at the age of forty-nine, and undertook the honorary duties of surgeon to Chelsea Hospital, which he retained for the rest of his life. His last contribution to science, made subsequently to his retirement, consisted of a series of plates with original remarks appended to Gataker's translation of Le Dran's 'Surgery.'

In 1751 he suffered an attack of apoplexy from which he recovered; but a return of the complaint caused his sudden death at Bath, on the 10th of April 1752, in his sixty-fourth year.

Cheselden's reputation as a surgeon was solid, and will be lasting. As a man, much that is good is recorded of him, and nothing unfavourable, unless it be his fondness for pugilistic exhibitions, which might have their interest for him as an anatomist. He associated with Pope and other wits of his time; but as his classical merit was certainly not considerable, their intimacy may be ascribed to his professional eminence and strong natural talents, rather than to the taste for literature and art, upon which he seems to have prided himself with no great reason.

CHÉSNE, ANDRÉ DU, born in 1584 in the province of Touraine, became distinguished for his historical and philological erudition, and was one of the most learned men of France in his age. The work for which he is best known is his valuable collection of the oldest French chronicles: 'Historia Francorum Scriptores costanei, ab Gentis Origine usque ad Philippum IV. tempora,' of which he edited 4 vols. fol. and his son, François du Chêne, edited the 5th after his father's death. He also published: 2. 'Histoire des Rois, Ducs, et Comtes de Bourgogne et d'Arles,' 2 vols. 4to. 3. 'Histoire des Cardinaux Français.' 4. 'Bibliotheca Chéniciensis.' 5. 'Bibliothèque des Auteurs qui ont écrit l'Histoire et Topographie de la France.' 6. 'Histoire des Papes,' 2 vols. fol. 7. 'Histoire généalogique des Maisons de Luxembourg, de Montmorency, Vergy, Guisnes, Châtillon, Béthune, &c.,' 7 vols. fol., besides a 'History of England' in 2 vols. fol., Paris, 1634. Duchesne died in 1640 near Paris. He has been called the father of French history.

* CHESNEY, COLONEL FRANCIS RAWDON, was born in 1789. He is a native of Ireland. He commenced his military education at the Royal Military Academy, Woolwich, as a second lieutenant in the Royal Artillery, May 2, 1804. He became lieutenant September 20, 1805. In 1808 the troops to which his company was attached were sent to protect the Channel Islands. He became captain of artillery June 20, 1815. In 1821 he married, and shortly afterwards was sent to Gibraltar, where his wife died, and with her his only daughter. He afterwards travelled a good deal at intervals, chiefly in order to examine the battle-fields of Europe and Western Asia. In 1829 Captain Chesney was sent to Turkey for the purpose of lending his assistance in fortifying the passes of the Balkan against the advancing armies of Russia; but before he had reached his destination the Balkan had been crossed, and the war between Russia and Turkey was soon afterwards concluded by the treaty of Adrianople. In 1830 Captain Chesney travelled in Egypt, where he examined the route across the desert from Cairo to Suez, and sent home a report on the passage by sea from Bombay to Suez, and by the Egyptian desert and the Nile from Suez to Cairo and Alexandria. In the same year he made a journey in Palestine and Syria. He crossed the Syrian desert to El Kayem, on the Euphrates, and followed the course of the river to Anah, whence he descended the Euphrates to the Persian Gulf, a distance of 638 miles, on a raft supported by inflated skins, his only companions being three Arabs to manage the raft, and an interpreter (a Turk) with his boy (a slave). He sent home a map and memoir of his track and explorations along the course of the river. After travelling some time in Persia and Asia Minor he returned to England in 1832.

In 1834 a committee of the House of Commons received evidence as to the comparative advantages of the routes to India by the Red Sea and by the Euphrates, and the House of Commons voted a sum of 20,000*l.* for an expedition to examine the route from the Mediterranean to the Euphrates, and the course of that river to the Persian Gulf. For this purpose two iron steam-vessels were constructed so as to take to pieces, Captain Chesney being appointed to the command of the expedition with the temporary rank of 'colonel on particular service.' The expedition sailed from Liverpool on the 10th of February 1835, and reached the mouth of the Orontes, on the coast of Syria, on the 3rd of April. The two iron steamers were transported in pieces, with excessive labour, partly on rafts and pontoons, and partly on waggon, from the mouth of the Orontes to Bir on the Euphrates, a distance of 133 miles. At Port William, near Bir, the steamers were put together, and on the 16th of March 1836 they commenced the descent of the Euphrates to the Persian Gulf, a distance of 1117 miles. They had proceeded 509 miles to Salahiya, when a hurricane overwhelmed and sank one of the steamers (the 'Tigris') and everything on board was irretrievably lost. The other steamer (the 'Euphrates') escaped with difficulty, but without much damage, and reached Basrah, on the Persian Gulf, on the 19th of June.

Besides the survey of the river Euphrates, which was the main object of the expedition, materials were collected for a correct map of Northern Syria, a line of levels was carried from Iskenderoon on the Mediterranean to Bir on the Euphrates, Northern Mesopotamia was explored, the river Tigris was twice ascended to upwards of 400 miles from its junction with the Euphrates, a line of levels was carried between the Tigris and Euphrates, and other valuable labours performed and information collected. Captain Chesney became major December 2, 1836, and his last arduous and dangerous task connected with the Euphrates expedition was that of taking a mail from the Persian Gulf across the great Arabian desert to Beirut on the Mediterranean, which he did unaccompanied by any European.

On the 27th of April 1846, Major Chesney attained the rank of lieutenant-colonel. In 1850 he published 'The Expedition for the Survey of the Rivers Euphrates and Tigris, carried on by Order of the British Government in the years 1835, 1836, 1837; by Lieutenant-Colonel Chesney, Commander of the Expedition. 4 vols. Vols. I. and II.' He became colonel Nov. 11, 1861. In 1852 he published 'Observations on the Past and Present State of Fire-Arms, and on the Probable Effects in War of the New Musket, &c.,' 8vo. In 1854 he published a narrative of 'The Russo-Turkish Campaigns of 1828 and 1829; with a View of the Present State of Affairs in the East, with Maps.'

CHESTERFIELD, PHILIP DORMER STANHOPE, fourth Earl of, was born in London on the 22nd of September, 1694. Treated with coldness almost amounting to aversion by his father, he was placed first in the hands of a private tutor, and at the age of eighteen sent to Trinity College, Cambridge, where he studied the Greek and Roman writers with unusual diligence. He tells us that he narrowly escaped becoming a pedant, a character for which he had the greatest contempt in after life; and that he drank and smoked at college notwithstanding his aversion to wine and tobacco, because he thought such practices were *genial*, and made him look like a man. In 1714 he left the university to make the usual grand tour of Europe. He passed the summer at the Hague, where his fashionable associates not only laughed him out of his pedantry, but initiated him into a love of play which never forsook him. Many years after he tells his son in one of his letters that at the Hague he thought gambling an accomplishment, and as he aimed at fashionable perfection, he adopted cards and dice as a necessary step towards it. From the gamblers of the Hague he went to the fashionable ladies and titled courtizans of Paris, who, as

he was accustomed to boast, completed his education and gave him his 'final polish.' He was at Venice when the accession of George I. in 1715 induced him to return home with great speed, in order to be in time for a court place. Through the interest of his family connections he was made a gentleman of the bed-chamber to the Prince of Wales, afterwards George II. In the first parliament of the new reign he was returned for St. Germans in Cornwall, and as he was determined to attract attention, from the moment of his election he studied nothing and thought of nothing, for a whole month, but his unaided speech. Though he afterwards became an accomplished orator, his first effort was rather a failure, and betrayed a violence of manner not at all consistent with his smooth silken code. The speech was otherwise unfortunate, for it attracted attention to the fact that he was not quite of age, and consequently liable not only to expulsion from the Commons' house, but also to a fine of 500*l.* An opponent mentioned this to him privately as a good mode of silencing his zeal: Chesterfield took the hint, and withdrew for some months to Paris, where, as it was always suspected, he was engaged in some secret court intrigue. He returned in 1716, and, resuming his seat, spoke in favour of the Septennial Act. In the inveterate quarrel which broke out between George I. and his heir he adhered to the Prince of Wales, nor could his uncle, General (afterwards Earl of) Stanhope, who was then at the height of favour, with plenty of places at his disposal, ever induce him to change sides. Being much with the heir-apparent, he undertook the difficult task of transforming a German prince into a British king, and of making a fashionable and a most refined man (as he understood it) of the rough and homely George.

His first division in parliament against the ministry was on a motion for the repeal of the Schism Bills, where he decidedly took the illiberal side of the question, as he lived to regret. In 1726 he was removed by the death of his father to the House of Lords, where his manner of speaking was much more admired than it had been in the Commons. He was constitutionally weak and devoid of strong passions, and as a speaker had little faculty of touching the higher feelings of others; but he was brilliant, witty, and perspicuous—a great master of irony—and was allowed by all his contemporaries to be one of the most effective debaters of the day. On the accession of George II., whom as prince he had steadily served for thirteen years, Chesterfield expected a rich harvest of honours and places; but having mistaken the relative amount of the influence exercised on his master's mind by the queen and the mistress, he paid his court to Mrs. Howard (afterwards Lady Suffolk), and neglected Queen Caroline, who eventually proving to be more powerful than the mistress, checked his aspiring hopes. He was not alone in this error; Lord Bolingbroke, Lord Bathurst, Swift, Pope, and many others of less fame, shared in it, and in the consequent disappointment. Pope's villa at Twickenham was the place of rendezvous, where the royal mistress used to receive the income of Chesterfield and the rest who had hoped to rise through her favour. In 1728, the year after the accession, Lord Chesterfield accepted the embassy to Holland, where he gained the friendship of Simon Van Slingeland, a distinguished statesman, and then Grand Pensionary, and assiduously cultivated his talent for diplomacy. To Slingeland he afterwards acknowledged the greatest obligations, calling him his "friend, master, and guide," and adding, "for I was then quite new in business, and he instructed me, he loved me, he trusted me." Chesterfield had the merit of averting a war from Hanover, for which service George II. made him High Steward of the Household and Knight of the Garter. Under the plea of ill-health he obtained his recall from Holland in 1732, and returning to court, where his office of Steward gave him constant access, he again indulged in the hope of rising. No sooner however had his lordship shown his decided opposition to Sir Robert Walpole, by making his three brothers in the House of Commons vote against the Excise scheme, than he was deprived of the High-Stewardship, and so badly received at court, that he soon ceased visiting there altogether. Lord Chesterfield now took a most decided and active part in the opposition to the minister, and it is even asserted that the real object of a visit which he paid to the Duke of Ormond, at Avignon, during a visit he made to France for his health in the autumn of 1741, was to "solicit through the duke an order from the Pretender to the Jacobites, that they should concur hereafter in any measures aimed against Sir Robert Walpole." The Stuart papers throw no light upon this question, and the supposition appears scarcely justified by any circumstances adduced in support of it. (See Horace Walpole's 'Memoirs,' i. 45; and Lord Mahon [Earl of Stanhope] 'Hist. of England,' chap. xxiii.) In the ministry formed on the resignation of Sir Robert Walpole in 1742, Chesterfield was excluded from office, and he at once went into opposition against the members of the new cabinet, with whom, when out of place, he had been accustomed to vote in the minority. On the coalition of parties known by the name of the "broad-bottomed treaty," he took office, sorely against the inclination of the king, who considered him as a personal enemy; but in order to satisfy his majesty, and remove him from the royal presence, he was named while in Holland, Lord-Lieutenant of Ireland. Chesterfield, while in opposition, had still further offended the king by repeatedly denouncing the union of the electorate of Hanover with the kingdom of England, and by proposing that they should be separated from each other, and allotted to different branches of the reigning family. Before proceeding to Ireland, the new lord-

lieutenant, at the beginning of 1745, the year of the Pretender's last war in Scotland, and a time of intrigue and difficulties, consented again to proceed as ambassador to Holland. On his return in a few weeks, he immediately repaired to his Irish post, where he distinguished himself, in a season of very great turbulence, by his tolerant spirit, and conciliating popular manners. His short government in Ireland was perhaps the most brilliant and valuable part of his public life. Instead of treating it as his predecessors had done, as a sinecure, Chesterfield made his post one of active exertion. He reformed abuses, dealt out even-handed justice to all parties, and though entering on office at a time of turbulence and danger, acted so as to conciliate the disaffected, and to secure a "degree of tranquillity such as Ireland had not often displayed even in orderly and settled times." George II., whose prejudices were removed or weakened, recalled him from Dublin in April 1746, and appointed him principal secretary of state. In consequence of finding himself constantly thwarted by the Pelhams, and being obstructed in some measures which he considered important, and of his now really declining health, he resigned his office in January 1748, much, it is said, to the regret of the king, who offered to make him a duke, an honour which Chesterfield respectfully declined. He was kept from the House of Lords by his giddiness and deafness, but in 1751 he delivered an elegant speech in favour of adopting the New Style, a measure in which he took great interest, and for which he had endeavoured to prepare the public mind by writing in some of the periodicals. His declining years, though now and then brightened by flashes of wit and merriment, were clouded by sickness and despondency arising from his loss of hearing. He died on the 24th of March 1773, in the 79th year of his age. His natural son, Philip Stanhope, to whom his well-known Letters were addressed, died five years before him.

By his wife, Melusina Schuemburg, countess of Walsingham, and niece or daughter to George I.'s mistress, the Duchess of Kendal, he had no issue. After much opposition from George II., who pretended to find his objection on Chesterfield's incessant gambling, this German lady married his lordship in 1733. In the will left by George I., and destroyed by George II., it is affirmed that there were large legacies to the Duchess of Kendal and Lady Walsingham, and that upon Chesterfield threatening a suit in Chancery for his wife's supposed legacy, he received in lieu of it the sum of 20,000*l.* This affair is said to have been a chief cause of the king's enmity against him. (Walpole, 'Memoirs,' and 'Reminiscences'; Mahon, 'History.') Chesterfield always had a certain taste for literature, and a partiality for the society of literary men. At different times of his life he associated with Addison, Pope, Swift, Gay, Arbuthnot, Voltaire, Montesquieu, and Algarotti. He patronised Hammond, a poet of third-rate merit, but an unfortunate amiable man, and procured him a seat in parliament. In his intercourse with Samuel Johnson he gave himself lordly airs, and the sturdy doctor, thinking himself slighted, avenged himself in the celebrated letter which was prefixed to the first edition of his 'Dictionary.' His 'Letters to his Son,' which were published by his son's widow the year after his death, were never intended for publication. They have been much censured for the loose morality which they inculcate; but still, though their low moral tone must be admitted, it must also be acknowledged that they show a great knowledge of the world, and much practical good sense, expressed in a singularly easy, agreeable, and correct style. His 'Miscellanies,' consisting of papers printed in 'Fog's Journal,' and 'Common Sense,' of some of his speeches and other state papers, and a selection from his 'Letters to his Friends,' in French and English, together with a 'Biographical Memoir,' written by his friend and admirer Dr. Maty, were published in 2 vols. 4to, in 1777. A third volume was added in 1778. Chesterfield also wrote Nos. 100 and 101 in the 'World,' in praise of Johnson's 'Dictionary,' and sundry copies of very light verses which appeared in Dodsley's collection.

(Dr. Maty, *Life*; Lord Orford, *Works*, vol. i. p. 533, and vol. iv. p. 277; and especially Earl Stanhope's admirably-edited *Letters and Works of P. D. Stanhope, Earl of Chesterfield*, 5 vols. 8vo, 1853.)

CHETTLE, HENRY, whose name occurs very frequently in the history of the old English drama, was a contemporary of Shakspeare. We read the names of over forty plays attributed to him in whole or in part, the dates of which extend from 1597 to 1602; but his writing for the stage must have begun before 1592, when he published Greene's 'Groat-worth of Wit.' Chettle appears to have been originally a compositor; and in a receipt given to Henslowe in 1598 he styles himself 'stationer.' He led an unsettled life, was constantly in pecuniary straits, and more than once in prison for debt. In Henslowe's 'Diary' there are numerous entries of small sums advanced to Chettle (or, as Henslowe in his queer orthography more commonly calls him, 'harye chettell') on plays he has undertaken to write. They appear to be usually written in conjunction with some other persons, but sometimes his name appears alone, thus:—"Lent unto Thomas Downton, the 27 of february 1598 [1599], to paye unto harye chettell, in full payment for a playe called Troyes Revenge, with the tragedy of poleme, the sume of fiftye shillenges; and strooken of his doatte, which he owes unto the company, fifty shillenges more." Four only of his plays have been printed, of which an account is given in Collier's 'History of Dramatic Poetry;' and the same editor has

inserted, in his 'Supplementary Volume' to Dodsley's collection, 'The Death of Robert, Earl of Huntington,' written by Chettle and Anthony Munday. Examples of his style will be found in Lamb's 'Specimens.'

CHEVREUL, MICHEL EUGENE, a distinguished chemist, was born at Angers, August 31st, 1786. His father, who practised as a physician, took good care of his education, and sent him to the Central School at Angers. In 1803 the youth removed to Paris, and studied chemistry under Vauquelin. In 1810, when not more than twenty-four years of age, he became assistant naturalist to the museum; but some of the professors having taken umbrage at the growing importance of the appointment, it was abolished. Later M. Chevreul was named professor of science at the College Charlemagne; then officer of the University; examiner at the Ecole Polytechnique, and lastly director of the dyeworks, and professor of special chemistry at the Gobelins. Here he signalled his practical science and judicious taste by his innovations with respect to associated colours. He gave a course of lectures on the subject, which were understood only by a limited number of adepts. The opinion that taste and colours should not be discussed had passed into a proverb: Chevreul denied the assertion, and drew up a species of æsthetics for the use of dyers, manufacturers, and artists.

In 1826 Chevreul was elected a member of the Academy of Sciences, and a foreign member of the Royal Society of London, and in 1829 he succeeded Vauquelin in the professorship of applied chemistry at the Jardin des Plantes. One of his earliest works, which has contributed in no small degree to his reputation, was an analytical treatise 'Recherches chimiques sur les Corps gras d'origine Animale.' It establishes an epoch in science by its rigorous and philosophical method; and in the arts by the multitude of its applications and the greatness of its results. From it many new branches of industry have been created, and others profitably metamorphosed. Oleic acid, so useful in the preparation of woollen yarns, stearine, and the remarkable imitations of essences and perfumes, all originated in Chevreul's researches.

In 1831 M. Chevreul published 'Leçons de Chimie appliquée à la Teinture, faites à la manufacture Royale des Gobelins,' 2 vols. 8vo, which became a text-book on that subject. In 1839 appeared 'De la Loi du Contraste simultané des Couleurs, et de l'assortiment des objets colorés, considéré d'après cette Loi dans ses rapports avec la peinture,' &c. This is a remarkable work, full of philosophical reflections, apt generalisations, and scientific illustrations of the theory. The laws of harmonious colouring are therein clearly established. It has been translated into English, and wherever known is recognised as a thoroughly scientific and practical authority. By invitation of the minister of commerce, M. Chevreul delivered a course of lectures on the subject at Lyon, from which great advantages accrued to the manufacturers of that city. M. Chevreul shows the applications of his theory to be innumerable, and discusses especially the optical effects of silken stuffs, illustrating his doctrine by contiguous metallic cylinders, regarded under four different aspects: according as they are parallel or perpendicular to the plane of the luminous rays that strike them, and according as the observer turns his back or his face to the light, and he examines the question as to whether the light is more particularly reflected by the warp or weft of the tissue. This theory was printed in 1846 at the expense of the Chamber of Commerce of Lyon.

In 1852 the Société d'Encouragement awarded to M. Chevreul their prize of 12,000 francs for his work on the 'Corps Gras,' and expressed at the same time by the mouth of M. Dumas, one of the foremost chemists of the day, their high opinion of his merits.

Among the numerous writings with which M. Chevreul has enriched science for more than forty years, are some of no little importance on the chemical reactions which affect the hygiene of populous cities. In these he traces the causes of insalubrity, and treats the subject from a point of view which raises it into a science applicable in sanitary regulations.

Although in his seventieth year, M. Chevreul retains his intellectual activity, and takes part in the meetings of the Institute, in the administration of the Jardin des Plantes, in the management of the Société centrale d'Agriculture, and of the Gobelins, besides delivering every year two or three courses of lectures on chemistry. This latter is his favourite science, and he has for some time been engaged in writing a history of it. His fitness for the task is demonstrated by the many able articles from his pen in the 'Journal des Savants,' the 'Annales de Chimie,' 'Dictionnaire des Sciences naturelles,' 'Mémoires de l'Académie des Sciences,' and other publications. He is a member of most of the principal scientific societies of Europe.

CHEYNE, GEORGE, was born in Scotland, in the year 1670. He was at first intended for the church, but after attending the lectures of Dr. Archibald Pitcairn, he determined to practise medicine. Having taken his Doctor's degree, he came to London about 1700, and soon after published his 'Theory of Fevers,' in which he attempts to explain the doctrine of secretion on mechanical principles. His next work, 'On Fluxions,' was published in 1705, and procured his admission into the Royal Society. At a maturer age he called this a juvenile production, and acknowledged that it was justly censured by De Moivre, to whom and to Dr. Oliphant he makes an apology in the

preface to his 'Essay on Health and Long Life,' for having treated their criticisms with rudeness. His 'Philosophical Principles of Natural Religion,' containing the elements of natural philosophy, and the evidence of natural religion to be deduced from them, was dedicated to the Earl of Roxburgh, for whose use it appears to have been written.

Cheyne's natural disposition to corpulency was so increased by full living in London, that in a few years he became "fat, short-breathed, lethargic, and listless." His health gradually sank, and, after trying a variety of treatment with little benefit, he confined himself to milk, with "seeds, bread, mealy roots, and fruit." The experiment succeeded, and he was soon relieved of his most distressing symptoms. During his illness, being deserted by his old associates, he began to look to religion for consolation, and at last "came to this firm and settled resolution in the main, viz., to neglect nothing to secure my eternal peace, more than if I had been certified I should die within the day; nor to mind anything that my secular obligations and duties demanded of me, less than if I had been ensured to live fifty years more. This, though with infinite weakness and imperfection, has been my settled intention in the main since." ('The English Malady,' 2nd edit., p. 334.)

In 1722 he published an 'Essay on the true Nature and due Method of treating the Gout,' together with the virtues of the Bath waters, and the nature and cure of most chronic diseases. He had resided at Bath during the summers of several years, and attributed much of the benefit he had received to drinking the waters. In 1724 appeared his well-known 'Essay on Health and Long Life,' in which he inculcates the necessity of a strict regimen, particularly in diet, both in preventing and curing diseases. It was dedicated to Sir Joseph Jekyll, Master of the Rolls, who had been under the author's care. In the preface he gives an account of his former works, which he censures where faulty, with great frankness, particularly when he had treated other writers with levity or disrespect. In 1733 he brought out his 'English Malady,' a treatise on the spleen and vapours, as well as hysteric and hypochondriacal diseases in general. This work, once very popular, contains a very minute account of the author's own case. It appears that on his recovery he gradually returned to a more generous diet. "However for near twenty years I continued sober, moderate, and plain in my diet, and in my greatest health drank not above a quart, or three pints at most, of wine any day (which I then absurdly thought necessary in my bulk and stowage, though certainly by far an overdose), and that at dinner only, one half with my meat, with water, the other after, but none more that day, never tasting any supper, and at breakfast nothing but green tea, without any etable; but by these means every dinner necessarily became a surfet and a debauch; and in ten or twelve years I swelled to such an enormous size, that upon my last weighing I exceeded 82 stone. My breath became so short, that upon stepping into my chariot quickly, and with some effort, I was ready to faint away for want of breath, and my face turned black." ('The English Malady,' 2nd edit., Lond., 1734, p. 342.)

He now returned to his low diet, and with the same success as before, though it required a longer time to re-establish his health. The proposal of a milk diet appears to have afforded much diversion to contemporary wits, some of whose gibes and sarcasms rather ruffled our author's complacency. Dr. Cheyne died at Bath, in 1742, at the age of 72.

CHILD, SIR JOSIAH, BART., was an eminent London merchant in the latter part of the 17th century, and one of the ablest of our earlier English writers on commerce and political economy. His principal publication is entitled 'Brief Observations concerning Trade and the Interest of Money,' by J. C., 4to, London, 1668. In his preface he tells us that this tract was written at his country-house in the sickness-year, that is, in 1665. Its leading purpose is to defend the late reduction of the legal rate of interest from eight to six per cent. (originally made by ordinance of the Long Parliament in 1651, and confirmed at the Restoration), and to urge a still further reduction. The author's great example of commercial success is that of the Dutch, and he maintains that "the lowness of the rate of interest is the *causa causans* of all the other causes of the riches of that people." The rate of interest, as is now well understood, is merely a measure or expression of the ratio of the supply of money to the demand. It rises or falls with the rate of profits; and that again depends in great part upon the quantity of capital seeking for employment; so that, in fact, instead of a low rate of interest being the cause of accumulated wealth in a community, it is more likely to be the consequence of that state of things. This was pointed out in an answer to Child's treatise, published the same year under the title of 'Interest of Money Mistaken, or a Treatise proving that the abatement of Interest is the effect and not the Cause of the Riches of a Nation.' In another respect also Child's notions in this publication are opposed to those now generally entertained; his recommendation, namely, that the natural rate of interest should be kept down, or rather attempted to be kept down, by a legal restriction. In support of his views he reprints, as an appendix, Sir Thomas Culpeper's 'Tract against the High Rate of Usury,' first published in 1623. Notwithstanding some fundamental defects however, the work contains much that is sound and valuable; and some of the principles laid down in it are both in advance of the

current opinions of the day and pithily and happily expressed. A second edition, much enlarged, appeared in 1690, under the title of 'A New Discourse of Trade'; a third in 1699; and the work has since been twice reprinted, the last time in 12mo at Glasgow in 1751. It is in this work that Child has explained his plan for the relief and employment of the poor, of which Sir Frederic Eden has given an account in his 'State of the Poor,' vol. i. pp. 186, &c. It included the substitution of districts or unions for parishes, and the compulsory transportation of paupers to the colonies. He proposes that the funds should be managed by an incorporated body to be styled 'The Fathers of the Poor,' and to wear, each of them, "some honourable medal, after the manner of the familiars of the Inquisition in Spain." In Watt's 'Bibliotheca,' and other catalogues, this plan is noticed as a separate publication (though without date); but we do not know that it ever appeared except as one of the chapters of the 'New Discourse of Trade.' Child, who was one of the directors and for some time chairman of the East India Company, and who took a leading part in the conduct of its proceedings, is stated to have written several tracts in defence of the trade to the East Indies; but they appear to have been all anonymous, and the only one which has usually been distinctly assigned to him is that entitled 'A Treatise wherein it is demonstrated that the East India Trade is the most national of all Foreign Trades,' by *Philosophus*, 4to, London, 1681. This is affirmed in the work called 'The British Merchant' (originally published in 1710, second edition, vol. i. p. 162, to have been written by him, or at least by his direction. It was contended by the opponents of the company that the East India trade was ruinous, or prejudicial, by reason of its draining the country of gold and silver; it was answered by Child, as it had been many years before by Thomas Mun, in his 'Discourse of Trade from England unto the East Indies,' that the trade in reality brought more treasure, or gold and silver, into the country than it took out of it, by our sales of eastern commodities to other European nations. It was upon this ground simply that parliament had recently (by the 15 Car. II., c. 7, s. 12) so far permitted the trade to be legally carried on in the only way it could be carried on at all as to allow the exportation duty-free of foreign coin and bullion.

Taking his stand upon what has been called the mercantile system, the principle of which is, that the value of a foreign trade depends upon the balance which it leaves to be received in money, Child admitted the paramount importance of gold and silver; but contended that the effect of the India trade, taken in its whole extent, as including the trade with other countries which we carried on by means of our imports from the east, was to promote, not to prevent, the accumulation in our hands of the precious metals. The destruction however of the fancy that there was anything necessarily desirable in that result, as far at least as it could be destroyed by reasoning, and the demonstration of the truth that gold and silver do not differ in any respect in their commercial character from other commodities, were accomplished a few years after this date by Sir Dudley North in his 'Discourses upon Trade, principally directed to the Cases of Interest, Coinage, Shipping, and Increase of Money,' 4to, London, 1691.

Sir Josiah Child was the second son of Richard Child, a merchant of London; he was born in 1630, was created a baronet in 1678, and died in 1699. He attained to great wealth, was thrice married, and by each of his wives had one or more children, who married into some of the highest families among the nobility. His last wife survived till the year 1735, "at which time," we are told by Morant, the historian of Essex, "it was said she was nearly allied to so many of the prime nobility that eleven dukes and duchesses used to ask her blessing, and it was reckoned that above fifty great families would go into mourning for her."

CHILDREN, JOHN GEORGE, was born on the 18th of May 1777, at Ferox Hall, Tonbridge. From the Grammar school of that town he went to Eton, and afterwards, in 1794, entered Queen's College, Cambridge, as fellow-commoner. He studied with a view to the church, but the early death of his wife led him to travel in the south of Europe and in the United States, from whence he returned to devote himself to scientific pursuits.

While studying mineralogy, chemistry, and galvanism, he made the acquaintance of Davy, Wollaston, and other leading men of science. In 1807 he was elected a Fellow of the Royal Society. In the following year he contributed a paper to the 'Philosophical Transactions,' on 'Some experiments performed with a view to ascertain the most advantageous method of constructing a voltaic apparatus, for the purposes of chemical research,' in which he determined the effect of unusually large battery plates. With twenty pairs of plates each four feet long and two feet wide, he confirmed Davy's observation, "that intensity increases with the number [of plates], and the quantity of electricity with the extent of the surface."

This was followed in 1815 by a paper, published also in the 'Philosophical Transactions,' 'An account of some experiments with a large voltaic battery,' in which a further series of singularly interesting results was described, among them the conversion of iron into steel by union with diamond, under the sole action of the battery.

Between the dates of these papers Mr. Children travelled in Spain, and visited the quicksilver mines of Almaden, then but little known in England. In 1816 he was appointed one of the librarians in the department of Antiquities (afterwards of Natural History) of the

British Museum. In 1819 he published a translation of Thénard's 'Essay on Chemical Analysis,' and in 1822 of Berzelius's 'Treatise on the Use of the Blowpipe,' with additional experiments and notes. He discovered a method for extracting silver from its ore without amalgamation, and derived considerable profit by selling the right to use it to several South American mining companies in 1824. He helped in establishing the 'Zoological Journal,' which appeared in 1825, and was one of the first editors. In 1826 he was elected secretary of the Royal Society, and resigning the following year on account of ill health, was re-elected in 1830, and retained the office for seven years. In 1839, on the death of his third wife, Mr. Children resigned his post at the British Museum. He died on the first day of 1852.

CHILLINGWORTH, WILLIAM, was the son of William Chillingworth, mayor of Oxford, where he was born in October, 1602. In 1618 he was a scholar, and in 1628 a fellow, of Trinity College in that University. Some curious memoirs of him are preserved by Anth. Wood ('Athen. Oxon.' c. 20), who says "he would often walk in the college grove, and dispute with any scholar he met, purposely to facilitate and make the way of *wrangling* common with him, which was a fashion used in those days, especially among the disputing theologians, or those who set themselves apart purposely for divinity." The comparative merits of the English and Romish churches were at that time a subject of zealous and incessant disputation among the university students; and several learned Jesuits succeeded in making distinguished proselytes among the Protestant clergy and nobility. Chillingworth, being an able disputant, was singled out by the famous Jesuit Fisher, alias Johannes Perseus ('Biblioth. Soc. Jesu'), by whom he was convinced of the necessity for an infallible living 'Rule of Faith.' On this he at once adopted the Roman Catholic system, wrote out his reasons for abjuring Protestantism, and joined the Jesuits in their college at Douay.

After the lapse of a few months, the arguments addressed to him by his godfather, Dr. Laud, then bishop of London, induced him to abandon his new faith, and he returned to Oxford in 1631, where he passed about four years in reconsidering the Protestant tenets. The great work of Daille on the 'Fathers,' which then first appeared, is said to have finally determined him.

In 1635 he published his 'Religion of Protestants, a safe way to Salvation.' It excited great attention, and passed through two editions in less than five months. The principle of Chillingworth is, that the volume of Divine Scriptures, ascertained to be such by the ordinary rules of historical and critical investigation, is to be considered the sole authority of Christians, to the utter exclusion of ecclesiastical tradition. His assertion of the principle of private judgment was opposed as much by the Puritans as by the Roman Catholics; and while the Jesuit Knott, alias Matthias Wilson ('Biblioth. Patrum Soc. Jesu,' p. 185), contended that he "destroyed the nature of faith by resolving it into reason;" Dr. Cheynell "prayed that God would give him new light to deny his carnal reason, and submit to faith." These were two of the most determined of Chillingworth's antagonists. Cheynell was one of the assembly of divines who, in 1646, was sent to convert the University of Oxford. Chillingworth in the meantime, unable to reason his conscience into an approval of the 39 Articles, refused to accept any preferment in the church. His long letter on the subject to Dr. Sheldon (afterwards archbishop of Canterbury), a most interesting document, is given in his Life, by Des Maiseaux, p. 86, and in Kippis's 'Biog. Brit.' Nothing can be stronger than the expressions of refusal to subscribe with mental reservation. However, in a very short time he was completely persuaded by the arguments of Drs. Sheldon and Laud, that peace and union are the real object of subscription, not belief or assent—a doctrine held by Archbishop Sancroft and many other eminent divines. Accordingly he accepted the chancellorship of Salisbury with the prebend of Brixworth, Northamptonshire, annexed. Chillingworth, in 1640, was deputed by the chapter of Salisbury as their proctor to the Convocation in London. He was attached very zealously to the royal party, and wrote a treatise (unpublished) on 'The Unlawfulness of resisting the lawful Prince, although most impious, tyrannical, and idolatrous.' Being present in the army of Charles I. at the siege of Gloucester, August 1643, he acted as engineer, and devised the construction of engines, in imitation of the Roman 'testudines cum pluteis,' to assault the rebels and take the city by storm. Having accompanied the king's forces under Lord Hopton to Arundel castle, he was there with his comrades taken prisoner by the parliament army under Sir William Waller; and falling ill he was thence conveyed to the Bishop's palace at Chichester, where he died and was buried in January 1644. A singular scene occurred at his funeral. Dr. Cheynell, then rector of Petworth, appeared at the grave, with the work of Chillingworth ('Relig. of Protest.') in his hand, and after an admonitory oration on the dangerous tendency of its rationalism, he flung it into the grave, exclaiming, "Get thee gone, thou cursed book, which hast seduced so many precious souls—get thee gone, thou corrupt rotten book, earth to earth, dust to dust, go rest with thy author!" He afterwards published 'Chillingworthii Novissima, or the Sicknesse, Horeay, Death, and Burial of Wm. C., with a prophane catechism collected out of his works, by F. Cheynell, Fell. Mert. Coll. Ox.,' 1644 and 1725. In this singular production the object of the author's enmity is jeered at as "this man of reason whose head was as full of scruples as it was of engines." But the character and

abilities of Chillingworth have been greatly and justly extolled by many of our most distinguished writers. Tillotson styled him "the incomparable Chillingworth," and Locke says (on 'Education') "If you would have your son to reason well, let him read Chillingworth;" and again (on 'Study'), "For attaining right reasoning I propose the constant reading of Chillingworth: for this purpose he deserves to be read over and over again;" but Anth. Wood's opinion is not outdone by any, for he declares that "Chillingworth had such extraordinary clear reason that if the great Turk or the Devil could be converted, he was able to do it." The result of his remarkable proficiency in 'wrangling' is however stated by his intimate friend Lord Clarendon ('Hist. Rebell.') to have been that "Chillingworth had contracted such an irresolution and habit of doubting, that at last he was confident of nothing." It is said by Clarendon that "Chillingworth was a man of little stature," and that it was "an age in which many great and wonderful men were of that size." The 10th and best edition of 'The Religion of Protestants' is that in fol., 1742, with sermons, &c., and a life of the author by Dr. Birch. 'The Religion of Protestants' has been since often reprinted. There is a recent edition of Chillingworth's whole works, in 1 vol. 8vo. A complete list of his miscellaneous controversial works is given in Kippis's 'Biog. Brit.,' vol. iii., p. 515, and in the 'Life of Chillingworth,' by Des Maiseaux, 8vo, 1725.

*CHISHOLM, MRS. CAROLINE, was born about the year 1810, in the parish of Wootton, Northamptonshire, where her father, William Jones, was a small proprietor of land. He died while his daughter was young, but she was carefully brought up by her mother, and in her twentieth year was married to Captain Alexander Chisholm, of the Indian army. Soon after the marriage they proceeded to Madras, where Mrs. Chisholm's commiseration was excited by the neglected condition in which she saw the female children and orphans of the British soldiers. She succeeded in establishing, under her own management, a school for girls, and afterwards a school of industry, which had the most satisfactory results. After a residence of some years at Madras, the state of Captain Chisholm's health required a change of climate, and in 1833 he obtained leave of absence, and they removed to Australia. They resided for some time at Sydney, and when Captain Chisholm's health was re-established, he returned to Madras, but his wife remained at Sydney. About this time large numbers of young women were landed there from emigrant-ships, who, if they were not immediately engaged, were without friends, without money, and without a place to sleep in. Here again Mrs. Chisholm was excited to benevolent exertion, and her first efforts were directed to obtain an asylum for the destitute girls. Some allowance of food was supplied by the colonial government to those who applied for it, but no place of shelter. Mrs. Chisholm applied to Sir George Gipps, the governor, and at length, at the end of 1841, a low wooden building was obtained, part of an old barracks, and very small, where she herself mostly resided with the girls, in order to superintend and train them. Step by step she extended her plans of benevolence, lent small sums to assist the emigrants, travelled far into the interior, taking young women with her to place them in their situations, became known to the settlers, who willingly supplied food and shelter, established depôts in the bush, and a registry-office in Sydney, and in the period from 1841 to the end of 1845 had obtained situations for females and employment for men to the number of 11,000, to whom she lent small sums which amounted altogether to 1200*l.*, the whole of which was repaid, minus only 16*l.* In 1845 Captain Chisholm rejoined his wife, and in 1846 they decided on revisiting England. Before they left the colony several of the most distinguished persons in Sydney and the vicinity presented Mrs. Chisholm with an address of thanks "for her zealous exertions on behalf of the emigrant population;" and a subscription of 150*l.* as a testimonial, which, in accepting, she stated should "be expended in further promoting emigration, and in restoring wives to their husbands and children to their parents."

Captain-Chisholm and his wife landed in England at the end of the year 1846, and took up their residence at Islington, where she carried out her plans of assisting the emigrants of the poorer classes. She established a 'Family Colonization Society,' by which passage-money was collected by weekly instalments; she travelled in the manufacturing districts, and both there and in the metropolis explained her plans, and gave many interesting accounts of what she had done and seen. Large numbers of emigrants, properly and prudently provided for, were sent out in successive ships, and in 1854 she herself and her family left London in an emigrant-ship for Australia, with the intention, as she stated, of there spending the remainder of her life. A considerable sum was subscribed in Great Britain as a testimonial, and presented to her before she left.

CHODOWIECKI, DANIEL, a distinguished miniature-painter and etcher of the 18th century, was born at Dansig in 1726. His father was a tradesman of Dansig, and Daniel was brought up and continued in the business until his father's death in 1740. In 1743 he removed to Berlin, and entered into the service of an uncle, who seems to have kept a general store. One class of articles which he sold was painted snuff-boxes, the paintings of which were all executed by Daniel in his leisure hours, many of them on enamel, which art his uncle had had him taught for the purpose. The designs were all copied from prints, and were, according to Chodowiecki's own account, miserable performances: his whole knowledge of drawing and painting he had learnt

from an aunt in Danzig. Chodowiecki continued some time employed in this humble way, until through his enamel-master, Haid, he made the acquaintance of some of the artists of Berlin, whose works and conversation excited his ambition, and induced him in the year 1754 to devote himself arduously and exclusively to art. He commenced as a miniature-painter, and met with considerable success, but he soon foretook this tedious art for etching. He etched chiefly from his own designs, and as an etcher he ultimately obtained a reputation equal if not superior to that of any artist of his age in Europe. His etchings are very numerous, amounting to at least two thousand, but they are mostly small, and the greater part were executed for booksellers. A printseller of Berlin, of the name of Jakoby, published a complete catalogue of his prints in 1814, in one volume octavo; there is also a long list of them in his autobiography inserted in Meusel's 'Miscellany,' arranged chronologically; and another in Heineken's 'Dictionary,' arranged according to the subjects, consisting of heads, portraits, historical pieces sacred and profane, figures, and original compositions; landscapes, illustrations for pocket-books and almanacs, from novels, &c., and frontispieces, vignettes, and tail-pieces for various works. The works engraved after Chodowiecki's designs or drawings by other engravers are less numerous than his own etchings, but amount nevertheless to some hundreds, including several designs for Lavater's work on 'Physiognomy,' engraved by J. H. Lips and others.

Chodowiecki was director of the Royal Academy of the Arts of Berlin, where he died in 1801. Many of his designs are satirical, and he has been called the Hogarth of Berlin. All his works, though on a small scale, are remarkable for their expression, and the character is seldom exaggerated; his subjects are chiefly illustrative of common life or contemporary and recent history. Many novels and other light works which he illustrated, owed their success chiefly and in some cases entirely to his vignettes; and the 'Almanac' of the Berlin Academy, which he illustrated from the year 1770, had, from the same cause, a very extensive circulation.

* CHODZKO, ALEXANDER, a Polish poet, linguist, and traveller, of whom little is to be gathered but from scattered incidental notices in his own writings. In the poems of Korsak, a Lithuanian author, there is an epistle to Chodzko dated from Wilna in 1826, in which he congratulates him on his good fortune in being able to rove the East. In 1833 a volume of Polish poems by Chodzko himself was published at Posen, but is spoken of in no high terms by Polish critics. His next production was in English, and issued in London in 1842, at the expense of the Oriental Translation Fund. It is entitled 'Specimens of the Popular Poetry of Persia, as found in the adventures and improvisations of Kurrolog, the bandit-minstrel of Northern Persia, and in the songs of the people inhabiting the shores of the Caspian Sea, orally collected and translated with philological and historical notes by Alexander Chodzko.' In the preface, which is dated at London, July 1842, the writer tells us that he collected these poems during a sojourn of eleven years in the countries where they are current, and remarks, very truly, that the Oriental student will regret with him the omission of the original texts, which he had taken down in manuscript from the mouths of the reciters, few of whom could either read or write. These were not printed entire by the Oriental Translation Fund on account of the expense; but a few specimens in the Tuka-Turkman, the Perso-Turkish, and the Zendo-Persian dialects were added in an appendix, "from a hope of their greatly aiding the researches of investigators into the language of the cuneiform inscriptions of Van, Bistun, and Persepolis, and probably of leading to some knowledge even of those of Babylon." The volume is singularly interesting in its contents, which are chiefly descriptive of the exploits of a sort of Turkish Robin Hood, and which are rendered into spirited English by the Polish translator, who however acknowledges his obligations to the revision of the Rev. J. Reynolds, then secretary of the Oriental Fund. His next appearance as a writer was in French, in an essay on the bilingual Lycian inscriptions discovered in Asia Minor by Sir Charles Fellows, one of the languages of which he attempted to prove was of the Slavonic family. Unfortunately M. Chodzko appears to have taken the inscription from an inaccurate copy, and the speculations founded upon it are therefore untenable. This essay was printed by his friend the poet Adam Mickiewicz, as an appendix to 'L'Eglise Officielle et le Messianisme' (Paris, 1845), but had been circulated some years before that date. In 1844 Chodzko superintended the edition of Mickiewicz's 'Poems,' printed at Paris, which was the latest issued during the author's lifetime, and is the most important work of modern Polish literature. The first edition of Mickiewicz, printed at Paris in 1823, had been issued by Jakób Leonard Chodzko, who is probably a relative.

* CHODZKO, JAKÓB LEONARD, a Polish writer, whose works are frequently referred to by writers on Polish subjects, was born at Oborek, in the district of Ozmiana, on the 6th of November 1800, and was educated at the university of Wilna. He entered, with many of the other students, into a secret society formed by the student Zan against the Russian government; but before its discovery by the Russian authorities, which led to the banishment or imprisonment of most of its members, left Poland as secretary to Prince Michael Oginski, whom he accompanied on his travels. In 1826, not venturing to return to Poland, he established himself at Paris as an author, and has continued there since, in the peaceful exercise of the profession,

with the exception of a brief interval at the revolution of 1830, when he so distinguished himself at the barricades that he was appointed one of the aides-de-camp of General Lafayette. His chief works, all of which are in French, are, 'Observations on Poland and the Poles, as an Introduction to the Memoirs of Michael Oginski,' Paris, 1827; 'History of the Polish Legions in Italy,' 2 vols., Paris, 1829; and a new edition of Malte-Brun's 'Picture of Ancient and Modern Poland,' 2 vols., 1830, with such considerable additions, especially an essay on Polish legislation by Lelewel, and a sketch of Polish literature by Podczaszynski, as more than double the value of the original. He also superintended two series of a work entitled 'La Pologne Historique littéraire, &c.,' Paris, 1839-41, in which he was assisted by Madame Olympe Chodzko, his wife. The whole of his works are of the same character, useful compilations of facts, in which valuable information is brought together in one language, the materials of which had to be sought in another. He has made accessible to the European reader much that lay buried in the neglected literature of Poland.

CHOISEUL, ÉTIENNE FRANÇOIS, DUC DE, born in 1719, rose to the highest offices in the state under Louis XV., and was in fact the ruling minister during a great part of that reign. He was made minister for foreign affairs in 1758, minister at war in 1761, and some years after he resumed the department of foreign affairs. He held this last office till December 1770, when in consequence of his imperious character, which had made him many enemies at court among men of all parties, among whom were the Maréchal de Richelieu and the Duc d'Aiguillon, he was exiled to his estate of Chanteloup, where he wrote his memoirs and a satirical comedy against the royal family, and especially against the dauphin, afterwards Louis XVI., styled 'Le Royaume d'Arle quinerie,' which he printed himself at Chanteloup and distributed among his friends. His memoirs were published at Paris in 1790, after his death. The administration of the Duc de Choiseul was singularly unfortunate. In the war against England, which terminated by the peace of Paris in 1763, France lost Canada, and her fleets, as well as those of Spain, were defeated; and in the Seven Years' war France took the part of Austria against Frederic of Prussia, who triumphed over both. The Duc de Choiseul's partiality for Maria Theresa of Austria has been strongly censured. He concluded the marriage between Marie Antoinette and the dauphin, afterwards Louis XVI. In 1760 he expelled the Jesuits from France. He is also said to have secretly encouraged the first symptoms of discontent among the English colonies of North America.

The personal character of the duke was generous though haughty; he was disinterested and splendid in his expenditure, by which he ruined his own fortune. He loved the arts and literature, and was a friend of Voltaire and the other literary characters of that age. His enemies exaggerated his faults, and attributed to him crimes of which there is not the least evidence. He died at Paris in May 1785.

(Examen du Ministère du Duc de Choiseul in the *Mémoires du Duc d'Aiguillon*.)

CHRIST, JESUS. [JESUS CHRIST.]

CHRISTIERN II., of Denmark, born in 1481, was the son of King John, and grandson of Christiern I. He ascended the throne on his father's death in 1513. In 1520 he succeeded in having himself elected King of Sweden, which country had been long distracted by civil factions. Christiern took an atrocious, but, as he fancied it, an expeditious way of getting rid of all opposition for the future. Having assembled the chief nobles and prelates of Stockholm on the occasion of his coronation, he had them suddenly arrested and publicly executed. He also massacred a number of the citizens of Stockholm. (Puffendorf.) Gustavus Erickson, a descendant of the ancient kings, who was a prisoner in Denmark, having contrived to escape, took refuge in the forests of Dalecarlia, where he roused the peasantry, attacked Christiern and his satellite the Archbishop of Upsal, defeated them, and drove the Danes from Sweden. [GUSTAVUS ERICKSON.] Soon after Christiern was deposed by his own Danish subjects, who elected Frederick, duke of Holstein, in 1523. Christiern retired to Flanders, whence, after ten years, he set off with some Dutch troops, and made an attempt to recover his Danish dominions. He failed; and, being taken prisoner, was put in prison, where he died in January 1559. He has been called the Nero of the North.

CHRISTINA (of Sweden), the daughter of Gustavus Adolphus by Maria Eleonora, princess of Brandenburg, was born on the 8th of December 1626. Her father bestowed great care on her education, and having no son to succeed him was anxious to cultivate in her a strong and masculine disposition. Even when a mere infant he expected that she, as the daughter of a warrior, should hear the roar of artillery without emotion. On his departure for the wars in Germany, Gustavus Adolphus appointed a regency, and, carrying his daughter in his arms, presented her to the assembled states of the kingdom as their future sovereign.

Gustavus fell at Lutzen in November 1632. Christina, then six years of age, was proclaimed queen by the states, who left her in the hands of regents or guardians,—the five great dignitaries of the crown, who were charged with the administration of affairs and the task of completing the young queen's education. The Chancellor Oxenstiern, an experienced and enlightened statesman, was at the head of these dignitaries, and the other members of the regency were persons of ability and upright intentions. They however pursued the plan

of education and discipline that had been traced out by the king himself, and to this we must, in part, attribute the singular character afterwards displayed by Christina.

From her earliest years she was surrounded by grave masters and scholars, who crowded and oppressed her intellect with Latin, Greek, Hebrew, history, and politics; and for her lighter amusements she was allowed to ride on horseback in masculine attire, to hunt, to shoot, and review troops. The society of her own sex was soon insupportable to her. It is generally stated that she made considerable progress in several ancient and modern languages, and in other branches of knowledge, and that at the council table she showed a searching wit and great precocity of reason. But her knowledge was not digested, and her mind wanted the equilibrium which is given by refined taste and sound judgment. Bayle says she read daily some pages of Tacitus in the original.

In 1644 she took the reins of government into her own hands, and, much favoured by circumstances, acted rather a conspicuous part in the affairs of Europe. She at once finished a war with Denmark, obtaining by treaty the cession of some territory to Sweden; she pressed on the peace with Germany against the advice of Oxenstiern and others; and finally became a party to the treaty of Westphalia in 1648, by which, in consequence of the victories of her brave troops, she obtained several millions of dollars, three votes in the diet of the Germanic empire, and the cession of Pomerania, Wismar, Bremen, and Verden. When pressed by the states to marry, she constantly and firmly refused. The assigned motives of her refusal have been preserved in several eccentric speeches. Among those who aspired to her hand was her own cousin Charles Gustavus, a prince of excellent qualities. In 1649 she was induced by the states to declare him her successor; but she would not allow the prince any share of her sovereign power, of which she was exceedingly jealous. Soon after the naming of her successor was over, she had herself crowned with great pomp, under the title of King.

Having now no wars to engage her attention, she gave herself up with all the energy of her character to arts and literature, or rather to a mania of patronising artists and men of letters. Her court was soon crowded, good being mixed with the bad, the empty pretender with the real man of science, the sage with the buffoon. She attracted to Stockholm, Saumaise (Salmassius), Vossius, Bochart, Huet, Chevreau, Naudé, Meibom, and other foreigners, chiefly Frenchmen.

Bourdolot, a gossiping intriguing French abbé, who pretended to some knowledge of medicine, and who was retained in quality of her physician, became the great favourite of the queen by flattering her vanity and ridiculing her court of philosophers and men of letters, whose jealousies and jarrings were incessant. Christina spent enormous sums, for so poor a country as Sweden, in the purchase of books, manuscripts, statues, pictures, antiquities, and curiosities. But reverence and affection for her father's memory stifled the murmurs of the Swedes, and when, to the astonishment of everybody, she first spoke of abdicating, she was most earnestly entreated to remain on the throne. For some short time after this she showed a renewal of good sense and energy, and a disposition to public business. It was at this interval that Cromwell's ambassador, Whitlock, saw a good deal of her majesty, and that his secretary or follower, Morton, picked up that curious information about her court and herself which was afterwards published in England. ('Journal of an Embassy to Sweden in 1659-64, from the Commonwealth of England,' by Charles Morton; Whitlock's 'Journal' was also published in 1855.) Her distaste for what she called the splendid slavery of royalty, her desire to indulge in all her caprices in perfect liberty, and (a stronger motive perhaps than any other) her wish of presenting an extraordinary spectacle to the world, soon returning upon her, she formally signified her decided intention of renouncing the crown in May 1654, and on the 16th of June her abdication took place with great solemnity, she being then only in the 28th year of her age.

Christina reserved to herself the revenues of some districts in Sweden and Germany, the entire independence of her person, and supreme authority, with the right of life and death, over all such persons as should enter her service and form her suite. A few days after this public act she set off for Brussels, where she privately abjured the Protestant religion. A little later she publicly embraced Roman Catholicism at Innsbruck. From the Tyrol she travelled to Rome, where she made a sort of triumphal entrance, riding on horseback, dressed almost like a man. Here she surrounded herself with poets, painters, musicians, numismatists, and the like. Quarrelling however with some of the College of Cardinals, she made a journey into France in 1666. At Paris she of course made a great sensation. Her constant companions were authors and academicians; for the society of her own sex she showed a greater contempt than ever, and the only French woman about whom she seemed to take any interest was Ninon L'Enclos. Her stay in Paris is said to have been shortened by Cardinal Mazarin, who, finding her inclined to engage in some intrigues against his authority, took such measures as rendered that capital an unpleasant residence for her. She however returned to France in the following year, and added to her notoriety by causing Monaldeschi, her master of the horse and chief favourite, to be put to death, for some alleged offence. This murder she justified by stating that by her deed of abdication she had reserved to herself supreme power over her own

suite, that she was still a queen wherever she went, and that Monaldeschi was guilty of high treason. Strange to say, she found defenders elsewhere; and among them Leibnitz, who wrote an elaborate justification of the deed at Fontainebleau.

The court was offended, but took no public notice of this atrocious act. Finding herself avoided in France, Christina thought of visiting England, but the Protector Cromwell turned the dark side of his countenance towards her; she therefore did not land in England, but returned to Rome, where she presently involved herself in great pecuniary difficulties, and a quarrel with the pope (Alexander VII.). Upon the death of the king, her cousin, Charles Gustavus, in 1660, she travelled hastily from Rome to Stockholm, where, according to most accounts, she showed a strong desire to re-ascend the throne; but the minds of the people were entirely alienated, and her change of religion was an insuperable barrier. She returned once more to Rome, which she never again left, except for one or two short intervals, during the remaining twenty-eight years of her life. Through that long period her occupations were various, and many of her proceedings indicate eccentricity approaching to insanity. She took part in several political intrigues; she is even said to have aspired to the elective crown of Poland; she interested herself for the Venetians in Candia, besieged by the Turks; she quarrelled anew with the pope and cardinals, who had liberally supplied her with money; she engaged actively in the Molinist or Quietist controversy; she indulged in the dreams of alchemy and judicial astrology; she violently censured Louis XIV. for his revocation of the Edict of Nantes and his dragonades against the Protestants of France; she founded an 'Accademia,' or literary society; she corresponded with many savans, and she made a large collection of objects of art and antiquity. The ruling passion, in short, was the ambition of influencing great political affairs even when all power and influence had departed from her. She died at Rome with great composure on the 19th of April, 1689, in the sixty-third year of her age. Though she wrote continually, not much of her writing has been preserved. Her 'Maxims and Sentences,' and 'Reflections on the Life and Actions of Alexander the Great,' were collected and published by Archenholz, in his memoirs of her life, 4 vols. 4to, 1751. From the somewhat tediously minute work of Archenholz, who was librarian to the landgrave of Hesse Cassel, and an honest painstaking man, Lacombe derived the materials for his life of Christina, and D'Alembert his reflections and anecdotes of the same personage. Her 'Secret Letters,' and 'Memoirs of her own Life, dedicated to God,' are forgeries.

(See Archenholz, as above; Cateau-Calville, *Histoire de Christine, Reine de la Suède*; Fortia, *Travels in Sweden*; *Biographie Universelle*; the works of Bayle, her contemporary and correspondent; Voltaire; and Horace Walpole.)

* CHRISTINA, MARIA, mother of the Queen of Spain, Isabel II., was born April 27, 1806, in the city of Naples. She is the daughter of the late King of the Two Sicilies, by his second wife, Maria Isabel, daughter of Carlos IV., king of Spain, and is the sister of Ferdinand II., the present King of the Two Sicilies. She was married at Madrid Dec. 11, 1829, to the late king of Spain, Fernando VII. On the 10th of October, 1830, she gave birth to the present Queen of Spain. On the death of the king, September 29, 1833, she became by his will queen-regent (reina gobernadora) during the minority of her daughter. She was secretly married December 28, 1833, to Don Fernando Muñoz, then an officer in the royal life-guards. Shortly after the king's death, his brother, Don Carlos, laid claim to the throne, on the ground that by the Salic law females were ineligible, notwithstanding the law which had been passed before the king's death to make them eligible. A civil war ensued, which lasted till September 1840, when the partizans of Don Carlos were finally defeated. A conspiracy which was successfully accomplished, August 13, 1836, in the royal residence of La Granja, for a time deprived the queen-regent of her power, and compelled her to swear to the liberal constitution, June 18, 1837; after which she regained her authority, and continued to rule till 1840, when she gave her assent to a law which interfered with the deliberations of the ayuntamientos, or town-councils. The consequence of this violation of the constitution to which she had sworn was an insurrection which placed Espartero at the head of affairs, and the queen-regent abdicated Oct. 12, 1840. She then retired to France. After the fall of Espartero in 1843 she returned to Madrid. It having been decreed that the Queen of Spain had attained her majority November 8, 1843, on the 10th of November Maria Isabel took the oath to observe the constitution, and the regency of the queen-mother ceased. On the 13th of October 1844 the marriage of Christina with Muñoz, then created Duke of Rianzares, was publicly celebrated. As the queen at the time of her accession was still very young, the influence and power of Christina were little if at all diminished, and the measures of her government were generally arbitrary and unconstitutional. This state of affairs continued till the beginning of 1854, when insurrections commenced, which continued to extend till the 17th of July 1854, when the people began to fight with the soldiers in the streets of Madrid. On the 19th of July the ministers fled, the soldiers submitted to the people, a national junta was established, and Espartero was again placed in authority. The conduct of Christina, personal as well as public, had long filled the Spanish people with the greatest disgust. On the 28th of August 1854 she was compelled to leave the country, and is now (1856) living in exile.

CHRISTOPHE, HENRY, was born about 1767 or 1768. The place of his birth seems to be uncertain, for St. Christopher, St. Croix, St. Domingo, and Granada are mentioned by different writers. He first attracted attention when a young man as a skilful cook at a tavern in Cape Town, St. Domingo. In 1790, on the insurrection of the blacks in the French part of that island, he joined the insurgents, who paid great respect to his gigantic stature, energy, and courage. As the negroes succeeded he was promoted in military rank. Toussaint Louverture, the generalissimo of the blacks, employed him to put down an insurrection headed by Moïse, or Moses, that general's own nephew. Christophe, by employing consummate artifice, got possession of Moïse, who was put to death by his uncle, on which Christophe succeeded to his command in the northern province of French St. Domingo. He subsequently suppressed other revolts which troubled the dawn of negro freedom. In 1802, when General Leclerc, brother-in-law of Napoleon Bonaparte, conducted a strong expedition from France to regain St. Domingo from the blacks, Christophe boldly defended Cape Town; and when obliged to retreat he burnt a great part of the town, and carried off 2000 men, with whom he joined Toussaint Louverture. When Toussaint was treacherously seized and transported to Europe, Christophe rallied with Dessalines, who then became commander-in-chief of the blacks. Through the effects of climate and a fierce desultory warfare, in which no one was more distinguished than Christophe, there was no longer any French force in the island by 1805. Dessalines then assumed supreme power in Hayti, and advanced Christophe. Not long afterwards Dessalines was accused of abuse of power, and Christophe, joining with the mulatto Pethion, got up an insurrection and murdered him in October 1806. Christophe was then proclaimed generalissimo and president for life of the republic of Hayti, and he named his confederate Pethion his lieutenant and governor in the southern provinces. The negroes, imitating the republican proceedings of their old masters the French, had a national assembly of their own, which met at Cape Town, and gave plausible grounds for Pethion, who was probably only jealous of his superior, to quarrel with Christophe. The mulatto general accused the president of a design against the liberties of the republic; the president called the general an anarchist and a revolted subject, and taking up arms drove him back to Port-au-Prince, where Pethion however maintained himself and what he called his republic for nearly eleven years.

In 1811 Christophe being undisputed master of the greater part of the country, had himself proclaimed king of Hayti, under the title of Henry I., royalty at the same time being made hereditary in his family. Still following the fashions of Paris, he then organised a court and an hereditary nobility, creating black dukes, counts, barons, &c. On June 2, 1812, he was publicly crowned, and the ceremonies, all after the French pattern, are said to have been very solemn and imposing. On the fall of Napoleon, the house of Bourbon entertained hopes of regaining their old colony, but they were frustrated by the power and skill of Christophe, who possessed several qualities that fitted him for government. On the death of Pethion, in 1818, he endeavoured to get possession of his state by force of arms, but he was beaten back with great loss by the republican blacks under their new president, General Boyer. These reverses, added to subsequent losses by fire, and other accidents, materially weakened him at a moment when his cruelty had rendered him generally unpopular at home, and the state of his health unfitted him for exertion. He was lying in bed from the consequences of an apoplectic stroke in Sans-Souci, a fine palace which he had built and fortified, when an insurrection burst around him, which had been aided by President Boyer. The insurgents had already proceeded to extreme measures, and the Duke of Marmalade (a significant title), one of the first dignitaries of the kingdom, had proclaimed the abolition of monarchy. Seeing that nobles, generals, officers, and men alike deserted him, to avoid being taken prisoner, Christophe shot himself through the heart on the 8th of October 1820. His widow and children, with his favourite, General Noël, took refuge in Fort Henri, but the garrison presently surrendered, when his eldest son, Noël, and some inferior officers were massacred.

During his reign Christophe entertained some enlightened views. At one time he encouraged education, and the printing of books and newspapers. He even made a code of laws, which he called 'Code Henri,' as Bonaparte had called his 'Code Napoléon.'

CHRISTOPHER, DUKE OF WÜRTEMBERG, was born in 1515. His early life was part in great troubles. In 1519-20 the confederated Saxon cities expelled his father Ulrich from his dominions, and transferred the dukedom to the house of Austria. Christopher was carried to Vienna, where he narrowly escaped being made a prisoner by the Turks during their siege of that capital, under the great Solyman. In 1532 the Emperor Charles V. determined to confine him in a monastery in Spain, being more apprehensive of his talents than of those of his father the expelled duke, who was still living. When near to the Spanish frontier, Christopher escaped from his escort and fled to Bavaria, where his uncle, the reigning duke, and Philip the landgrave of Hesse, took up his own and his father's cause. The landgrave in 1534 defeated the Austrians in the battle of Laufen, and restored Duke Ulrich, who was well received by his people, and thenceforward placed under the safe protection of the great Protestant

league of Schmalkalden. The recovery of Würtemberg was a great advantage on the side of the Protestants; but it was not until 1552, or two years after the death of Ulrich and the accession of Christopher, that the Lutheran religion was fully established in that duchy. Finding, after a reign of two years, his authority was firmly established, Christopher proceeded to complete the work of the Reformation; and it is as a church reformer that he is honourably distinguished from the Protestant princes his contemporaries. The church property he appropriated to the purposes of education, and to the support of the ministers of the new religion. A great fund was formed out of it and kept sacred, under the name of the 'Würtemberg church property;' the revenue derived from which sufficed to support what were called the Würtemberg cloister schools—destined for the education of the clergy—the great theological seminary at Tübingen, and other establishments for the instruction of the people. Christopher also extended the liberties of his subjects, and gave them a code of laws. After a popular and beneficial reign of eighteen years, he died in December 1568.

CHRYSIPPUS, son of Apollonius of Tarsus, was born at Soli in Cilicia, B.C. 280. He appears to have been driven to study by having, in some way, lost or squandered his patrimony. When he determined on devoting himself to philosophy he went to Athens, and attended the instructions of Cleanthes, whom he afterwards succeeded. (Strabo, xiii. p. 610, Casaub.) Cicero ('De Nat. Deor.' ii. 6; iii. 10), in common with other ancient writers, describes Chrysippus as a skilful and acute dialectician, and (l. 15) accounts him the most ingenious expositor of the Stoic dreams. Habits of industry probably gave him an advantage over his rivals. Diogenes Laertius reports, upon the authority of Diocles, a statement of Chrysippus's nurse, that he seldom wrote less than 500 lines a day. It appears however that he indulged largely in quotations; and the actual amount of his original labour in composition cannot be gathered from the number of his productions. He is said by Diogenes to have written upwards of 705 volumes, many on the same subject. Cicero ('Tusc. Quest.' i. 108) gives him the character of a careful collector of facts. After Zeno he was considered the main prop of the Porch (Cic. 'Acad. Quest.' iv. 75); and allusions are frequently made to the estimation in which he was held. (Juvenal, 'Sat.' ii. 5; xiii. 184; Horace, 'Epist.' i. 2, 4.)

Chrysippus sometimes exposed himself to the attacks of his enemies, Carneades in particular, by defending two opposite sides of the same question: but the arguments which were good in his were good also in others' hands. He frequently succeeded in entangling his hearers by the use of the logical form 'sorites,' which is said to have been invented by him, and is called by Persius ('Sat.' vi. 80) 'Chrysippus's heap.' Sorites (*συνεπής*) means 'a heap,' and is in logic a heap of propositions in the syllogistic form. (Cic. 'Acad. Quest.' iv. 16; Whately, 'Logic,' p. 122.) Chrysippus did not spare his adversaries in his replies to their arguments; and some anecdotes which are told of him seem to show that he occasionally overstepped the bounds of moderation. Notwithstanding this, his style of argumentation was so much admired, that it was said, if the gods themselves were to use a system of logic, they would adopt that of Chrysippus.

Chrysippus appears to have held substantially all the main doctrines of the Stoic theology, though in some minute particulars he is said to have differed from Zeno and Cleanthes: the charges of impiety made against him are probably to be ascribed only to a peculiar method of advocating his opinions. He died, apparently from an apoplectic fit, at the age of seventy-three, B.C. 207.

(Diogenes Laertius, book vii. *Life of Chrysippus*; Fabricii, *Bibliotheca Græca*, vol. ii., pp. 392-93.)

CHRYSOLORAS, MANUEL, a learned Byzantine of the 14th century, was sent to Italy about 1397, by the Emperor Manuel Palæologus, to request the assistance of the Venetians and the pope, and the other Christian princes, against the Turks. Having fulfilled his mission, he settled at Venice, where he gave lessons in the Greek language. He afterwards taught the same at Florence, Pavia, and lastly at Rome, where he grew into favour with the papal court, and was sent to the council assembled at Constance, where he died in 1415. Poggio Bracciolini, Leonardo Bruni, and Filelfo, were the most distinguished pupils of Chrysoloras in Greek. Chrysoloras wrote a Greek grammar (entitled 'Ἐπερηγμένα,' 'Questions'), which was one of the first published in Italy, and was afterwards printed at Ferrara in 1509. He also wrote several epistles in Latin, in one of which, addressed to the Prince John Palæologus, son of Manuel, he draws an eloquent comparison between Constantinople and Rome, which has been often quoted. Chrysoloras ranks among the restorers of classical learning in Italy.

JOHN CHRYSOLORAS, the nephew of Manuel, taught Greek in Italy: he returned to Constantinople, where he died, about A.D. 1427.

DEMETRIUS CHRYSOLORAS, probably a native of Thessalonica, wrote on philosophy and theology. Some letters of his to the Emperor Manuel Palæologus, in whose service he was, and who employed him on several missions of importance, still exist in manuscript in the Bodleian, Oxford, and in the Royal Library at Paris. There are also manuscripts of several works by him, but they are of no importance.

CHRYSOSTOM, ST. JOHN (*χρυσόστομος*, that is, the golden-mouthed), the most renowned of the Greek fathers, was born of noble and very opulent parents, A.D. 354 (some writers say 344 and 347), at

Antioch, the capital of Syria. In early life he lost his father Secundus, who was commander of the imperial army in that province; and his mother Anthusa, from the age of twenty, remained a widow, in order to devote herself wholly to her son's improvement and welfare. He was educated for the bar, and studied oratory at Antioch under Libanius, who declared him worthy to be his successor, were it not that the Christians had made him a proselyte. He was taught philosophy by Andragathius, and spent some time in the schools of Athens. After a very successful commencement of legal practice, he relinquished the profession of law for that of divinity. At this time the rage for monachism was extremely prevalent, and Chrysostom retired to a monastery in a mountain solitude near Antioch, where, in opposition to the pathetic entreaties of his mother, he adopted and adhered to the ascetic system with rigid austerity during four years. The manners and discipline of the anchorites with whom he associated resembled, as described by himself, those of the Essenes, in fasting, praying, reading, subsisting on vegetable food, maintaining silence and celibacy, and discarding all consideration of *meum* and *tuum*. (Homil. 72, on 'Math.,' and 14, on 'Timoth.,' tom. ii.) At the age of twenty-three he was baptized by Meletius, bishop of Antioch, after which he withdrew into a solitary cavern, where, without any companion, he spent about two years in committing to memory the whole of the Bible, and in severely mortifying his carnal affections. Having neither bed nor chair, he reposed suspended by a rope slung from the roof of his cave. The damp and unwholesome air of the place reduced him at last to so ill a state of health, that he was obliged to return to Antioch, where, being ordained a deacon by Meletius (381), he commenced his career as a very eloquent popular preacher, and published several of his declamatory discourses and argumentative treatises. Five years afterwards he was ordained priest, and at the age of forty-three was made vicar to Flavianus, successor to Meletius. His fame as a church orator was now so established, that, on the death of Nectarius, archbishop of Constantinople, he was enthusiastically chosen by the people and priesthood of the city to fill that important office. Chrysostom, on this and former occasions, appears to have reiterated with sincerity the *noti me episcopari*: however, by the mandate of the Emperor Arcadius, he was consecrated and enthroned in 398 by Theophilus, patriarch of Alexandria, who afterwards proved to be one of the most envious and malignant of his enemies.

Chrysostom bestowed upon the indigent the whole income of his large patrimonial inheritance; and with the revenues of his episcopal see he founded and endowed an hospital for the sick, which procured for him the appellation of John the Almoner. Several times a week he preached to crowded audiences, and his oratorical sermons were received by the people with such shouts and acclamations of applause that his church became a sort of theatre, which attracted great numbers who had hitherto attended only the circus and other places of amusement. The resolute and fearless zeal of Chrysostom in the reformation of clerical abuses, and in the denunciation of licentiousness among the great, soon began to draw upon him the enmity of a confederate party, whose bitter retaliation finally effected his banishment and death. Much is said by various writers both in commendation and reprehension of his character and conduct. The church historian Socrates describes him as being "sober, temperate, peevish, irascible, simple, sincere; rash, rude, and imprudent in rebuking the highest personages; a zealous reformer of abuses; extremely ready to reprove and excommunicate; shunning society, and apparently morose and haughty to strangers." Such qualities embroiled him in continual quarrels with the secular clergy, courtiers, and statesmen, and especially with the wealthy female devotees of luxury and fashion, whom he reprov'd without the slightest reserve. His zeal for the promotion of his own sect was equalled only by his intolerance towards all others. He caused many temples and statues in Phœnicia to be demolished, and especially persecuted the Arians, refusing them the use of a church in the city, and parading in the streets Trinitarian singers of hymns, with banners and crosses, until the opposition vocalists fell to fighting and bloodshed. The vigour and perseverance of his efforts to reform the loose ecclesiastical discipline permitted by his indolent predecessor, occasioned the formation of a faction which sought to be revenged by his assassination. In his visitation in Asia, two years after his consecration, he deposed at one time no less than thirteen bishops of Lydia and Phrygia; and in one of his homilies (tom. ix., p. 29) he charges the whole episcopal order with avarice and licentiousness, saying that the number of bishops who could be saved bore a very small proportion to those who would be damned. It appears to have been a common custom at that time among the clergy to have each one or more young females residing with them, ostensibly for the purpose of receiving pious instruction as pupils. When therefore Chrysostom enjoined the discontinuance of this custom, as in all cases very questionable, and in many most evidently criminal, he at once excited in a great portion of his clergy the bitterest personal animosity. In his invectives against the vanity and vices of the female sex he used no reserve in reproving even royalty itself. The personal resentment and indignation of the beautiful and haughty Empress Eudoxia was probably therefore the real cause, as Gibbon suggests, of all the disasters by which he was henceforth overwhelmed, for she patronised the confederation which the deposed bishops formed with his adversary Theophilus, who assembled at Chalcedon a nume-

rous synod, by which there were preferred against Chrysostom above forty accusations, chiefly frivolous and vexatious, which, as he refused to acknowledge himself amenable to such a tribunal, and made no defence, were subscribed by forty-five of the bishops present, who in consequence resolved upon his immediate deposition. He was therefore suddenly arrested and conveyed to Nicæa in Bithynia, A.D. 403. This Theophilus is described by Socrates, Palladius, and several others, as a bishop addicted to perjury, calumny, violence, persecution, lying, cheating, robbing, &c. After Chrysostom's banishment, Theophilus published a scandalous book concerning him—a sort of collection of abusive epithets—in which Chrysostom is called a filthy demon, and is charged with having delivered up his soul to Satan. It was translated into Latin by the friend of Theophilus, St. Jerome, who joined in the abuse. Chrysostom was the idol of the great mass of the people. He was a pathetic advocate of the poor: his pulpit orations were calculated to excite their strongest emotions; when it was known therefore that their popular preacher was banished an alarming insurrection ensued, which rolled on with such fury to the palace gates that even Eudoxia entreated the emperor to recall Chrysostom, for already the mob had begun to murder the Egyptian attendants of Theophilus in the streets. Only two days elapsed before Chrysostom was brought back to Constantinople. The Bosphorus on the occasion was covered with innumerable vessels, and each of its shores was illuminated with thousands of torches. The archbishop however gained little wisdom from experience; for soon after, when a statue of the empress was set up near the great Christian church, and honoured with the celebration of festive games, he preached in very uncourteous terms against the ceremony, and compared Eudoxia to the dancing Herodias longing for the head of John in a charger. The result of this offensive conduct was the calling of another synod, which ratified the decision of the former, and again Chrysostom was arrested, and transported to Cucus, a place in the mountains of Taurus. Another uproar was made by the mob, in which the great church and the adjoining senate-house were burnt to the ground. The death of Eudoxia shortly afterwards, and a tremendous storm of hailstones, were regarded by the people as the avenging visitation of heaven. A great number of the poorer classes, who were always Chrysostom's most faithful adherents, refused to acknowledge his successor, and formed for some time a schism, under the name of Johannites.

Chrysostom bore his misfortunes with fortitude, and being still possessed of abundant wealth, he carried on very extensive operations for the conversion of the people about his place of banishment. His enemies soon determined to remove him to a more desolate tract on the Euxine, whither he was compelled to travel on foot, beneath a burning sun, which, in addition to many deprivations, produced a violent fever. On arriving at Comana, he was carried into an oratory of St. Basil, where, having put on a white surplice, he crossed himself and expired, September 14, 407, being about sixty years of age. Thirty-five years after his death and burial at Comana, his remains were brought with great pomp and veneration to Constantinople by Theodosius II. It is said they were afterwards removed to Rome. The Greek Church celebrates his feast on the 13th of November; the Roman on the 27th of January.

The works of St. Chrysostom are very numerous. They consist of commentaries, 700 homilies, orations, doctrinal treatises, and 242 epistles. The style is uniformly diffuse and overloaded with metaphors and similes. The chief value of Chrysostom's works consists in the illustration which they furnish of the manners of the 4th and 5th centuries. They contain a great number of incidental but very minute descriptions that indicate the moral and social state of that period. The circus, theatres, spectacles, baths, houses, domestic economy, banquets, dresses, fashions, pictures, processions, chariots, horses, dancing, juggling, tight-rope dancing, funerals, in short every thing has a place in the picture of licentious luxury which it is the object of Chrysostom to denounce. Montfaucon has made a curious collection of these matters from his great edition of the works of Chrysostom, 13 vols. folio (editio optima). ('Mémoires de l'Acad. des Inscrip.,' vol. xiii., p. 474, and vol. xx., p. 197; also Jortin, 'Eccles. Hist.,' vol. iv. p. 169, et seq.) The 'Golden Book' of St. John Chrysostom concerning the education of children, 12mo, published in 1659, is translated from a manuscript found in the cardinal's library at Paris, 1656. The precepts are very curious. The boy is to see no female except his mother; to hear, see, smell, taste, touch, nothing that gives pleasure; to fast twice a week, to read the 'Story of Joseph' frequently, and to know nothing about hell till he is 15 years old. Chrysostom is described by his biographers as being short in stature, with a large bald head, a spacious and deeply-wrinkled forehead, short and scanty beard, hollow cheeks and sunken eyes, having a look of extreme mortification, but in his movements remarkably brisk, energetic, and smart. He was strongly attached to the writings of St. Paul. His surname Chrysostom was not applied until some time after his death. The biographers of Chrysostom were very numerous: Socrates, lib. vi.; Sozomen, lib. viii.; Theodoret, lib. v.; 'Vis de St. Jean C.,' by Hermant, 8vo, 1665; Menard; Erasmus; Du Pin; Tillemont; Palladius; Photius; Ribadeneira; Gibbon, c. 32; Moreri's 'Dict.' contains a further list; Usher, 'Historia Dogmatica,' p. 33. There is a recent life of Chrysostom by Neander.

CHUBB, THOMAS, was born in 1679, at East Harnham, a small

village near Salisbury. His father died when Thomas, the youngest of four children, was a mere boy. After receiving a little instruction in reading and writing, Thomas was apprenticed to a leather glove and breeches-maker in Salisbury. He was afterwards, as a journeyman, engaged in the business of a tallow-chandler in the same city. In both these employments he continued to be more or less concerned until the end of his life, notwithstanding which he contrived to acquire a general knowledge of literature and science, and to become a distinguished writer on subjects of religious and moral controversy. The discussion which arose on the publication, in 1710, of the Arian work of Whiston on 'Primitive Christianity,' induced Chubb to write his 'Supremacy of God the Father asserted,' consisting of eight arguments from Scripture, intended to prove the Son to be a subordinate and inferior being. It was published in 1715, under the immediate superintendence of Whiston, and by opposite parties was equally extolled and condemned. Chubb replied to his Trinitarian opponents in 'The Supremacy of the Father vindicated.' In 1730 he published a collection of his occasional tracts in a handsome 4to volume; containing, besides the two works just mentioned, thirty-three others on faith, mysteries, reason, origin of evil, persecution, liberty, virtue, governmental authority in religion, &c. Among the eminent individuals who admired the writings of Chubb, and sought to be of service to him, was Sir Joseph Jekyl, master of the rolls (the early patron of Bishop Butler), who appointed him steward, or supervisor, of his house in London; an office of which the duties would appear to have been as little suited to the character of Chubb as those of a tallow-chandler. Some of the witty adversaries of Chubb made themselves extremely merry with the grotesque appearance of his short and fat figure as he officiated at his patron's sideboard, adorned with a powdered tie-wig and a dress-sword. After a year or two he relinquished his stewardship, returned to Salisbury, and to the last "delighted in weighing and selling candles." (Kippis, 'Biog. Brit.') His next publications were 'A Discourse on Reason, as a sufficient guide in matters of Religion,' 'On Moral and Positive Duties, showing the higher claim of the former,' 'On Sincerity,' 'On Future Judgment and Eternal Punishment,' 'Inquiry about Inspiration of the New Testament,' 'The Case of Abraham,' 'Doctrine of vicarious Suffering and Intercession refuted,' 'Time for keeping a Sabbath,' and several other tracts upon points of religious dispute. In 1733 appeared his 'True Gospel of Jesus asserted.' Chubb endeavours to show that as Jesus Christ taught Christianity previously to many of the remarkable incidents of his life, and therefore previous to his death, the gospel was properly the doctrine of moral reformation which he announced as a rule of conduct. In the following year, 1739, Chubb put forth a vindication of this work, and of the discourse annexed to it, against the doctrine of a particular Providence. Several answers to this work were published, by the Rev. Caleb Fleming and others, and replies and rejoinders followed between Chubb and his opponents up to the time of Chubb's decease. In February 1746 Chubb, according to his desire, died suddenly at the age of sixty-eight, as he sat in his chair. Though he left several hundred pounds, his income was to the last so scanty, that it is said he often thankfully accepted from Cheselden, the eminent surgeon, the present of a suit of left-off clothes. His posthumous works, consisting of numerous tracts similar to those already mentioned, were published in 3 vols. 8vo, 1748; and were answered by Fleming, his indefatigable opponent, in 'True Deism the Basis of Christianity; or, Observations on Chubb's posthumous Works.' Dr. Leland, in his 'View of Deistical Writers,' vol. i., has devoted above 80 pages to remarks upon them. For notices of Chubb, see also Bishop Law's 'Theory of Religion.' With an occasional blunder, arising from ignorance of the Greek and Hebrew languages, the writings of Chubb, in following the metaphysical school of Dr. Clarke, exhibit considerable argumentative skill, and a style remarkable for a temperate and critical propriety, and a pleasing fluency.

CHUND, or CHAND, or CHANDRA-BARDAI, the Homer of the Rajpoots, flourished in the 12th century of the Christian era, as the chief professional bard at the court of Prithwiraja, or Prat'hira, the last Hindu sovereign of Delhi; but his poems, which are in the spoken dialect of Canouj, are still thoroughly and universally popular among his nation after the lapse of more than six centuries. "The most familiar of his images and sentiments," says Colonel Tod, who held the post of English resident in Rajast'han, "I heard daily from the mouths of those around me, the descendants of the men whose deeds he rehearsed." His poem, which is called 'Prat'hira-j-Chôdn Râm,' is a kind of universal history of the period at which he wrote, including something on almost every subject from geography to grammar, interspersed with poetical fiction. It extends to 69 books, comprising about 100,000 stanzas, of which Colonel Tod tells us that he translated into English as many as 30,000. Every noble family in Rajast'han is commemorated in it in some shape, and the bard does not forget to interweave his own exploits into the narrative. The leading action of the poem is the daring exploit of Prithwiraja, who on receiving some stanzas from the Princess of Canouj, inviting him, if he is brave enough, to come and bear her away from her father's court from the midst of the princes assembled as suitors for her hand, accepts the challenge, and succeeds in carrying off the princess for his bride; but, as Chund remarks, to his own destruction, "though it gained him immortality in the song of the bard." A war ensues, and the

Affghan Shahabuddin, the Mohammedan invader of Prithwiraja's dominions, is six times defeated and twice taken prisoner; but twice released by the blind and chivalrous generosity of the Hindu sovereign. At last, in a final battle on the banks of the Caggar, Prithwiraja's army after three days' fighting is cut to pieces, and he himself is taken prisoner and carried to Ghuzni. Chund describes himself as following the train of the conqueror to the Afghan capital, determined to trace his royal master, and he tells us that though the Affghans tried to baffle him in his object, "the music of his tongue overcame the resolves of the guardian of the prison." The battle on the Caggar—a memorable date in the history of Hindustan, since it established Mohammedan rule in Delhi for more than 500 years—is stated by chronologists to have taken place in the year of the Christian era 1193. This, by a remarkable coincidence was the identical year in which our Cœur de Lion was imprisoned by the Duke of Austria, and in which Blondel, according to the legend, discovered him in his dungeon. Chund was not destined like Blondel to effect his master's release. The Affghan conqueror had deprived his captive of sight, and one of the finest passages in the poem, to which it is said not even the sternest Rajpoot can listen without emotion, is a soliloquy of the blinded monarch, deploring the fickleness of fortune and his own unfortunate generosity to the enemy of whom he was now the victim. How the poem concludes Colonel Tod does not mention, but he informs us that "Prithwiraja and the bard perished by their own hands, after causing the death of Shahabuddin." It is possible that the narrative may have been brought to a close by the son or grandson of Chund, both of whom were eminent poets, though they could not rival the glory of the Rajpootian Homer.

The fullest account of Chund that has appeared in English is in Colonel Tod's 'Translation of a Sanscrit Inscription relative to the last Hindu King of Delhi,' in the first volume of the 'Transactions of the Royal Asiatic Society,' London, 1827. A few additional particulars may be gleaned in the colonel's 'Annals and Antiquities of Rajast'han' (London, 1829-32). Several translated extracts from the poem are given in the article in the 'Transactions,' which are all of an animated and chivalrous cast, and the spirit of which is compared by the colonel to that of the ancient Scandinavian poetry.

CHURCHILL, CHARLES, was born in 1731 in Westminster, where in St. John's parish his father was curate. After passing through the usual course of studies in Westminster School he was taken by his father to Oxford to be matriculated in that university, but the levity of his behaviour at the entrance examination occasioned his rejection. He was shortly after admitted a member of the University of Cambridge, where however he did not stay long enough to take a degree, but returned to Westminster; and although he was but in his seventeenth year, and without any means of subsistence, precipitately married a young lady of the name of Scott. After a year's residence in his father's house he retired with his wife to Sunderland, and prepared for taking orders. At the age of twenty-five he was ordained by Bishop Sherlock. His course of life for the next two or three years is involved in obscurity; the most probable statement is that he acted as curate of Rainham in Essex, a curacy previously held by his father, and that he there opened a school. In 1758, on the death of his father, he succeeded to the curacy of St. John's in Westminster, and from this period a total alteration took place in his character and habits, which, from having been hitherto those of a moral, domestic, and studious man, became gradually ruined, and terminated in avowed and abandoned licentiousness. This change has been attributed to his intimacy with the clever but profligate poet, Robert Lloyd, whose father, Dr. Lloyd, a master of Westminster School, about this time interposed as the friend of Churchill, and rescued him from jail by advancing to his creditors a composition of five shillings in the pound: to the credit of Churchill it must be added that he himself subsequently paid the whole amount.

Churchill's first poems were the 'Bard' and the 'Conclave,' for which he was unable to obtain a publisher. The 'Rosciad,' a very clever and severe satire upon the principal theatrical managers and performers at that time, was published in 1761, at his own risk; the London publishers having refused to give five guineas for the manuscript. It obtained an amazing popularity, and was answered by the numerous parties attacked in Churchill's 'Murphyads, Examiners, &c.' The subject is one on which the author, as a poet and constant playgoer, was well qualified to express a critical judgment. Like most of his productions, it is more remarkable for energy and eloquent roughness of sarcasm, than for polished phraseology or refined sentiment. His next poem, the 'Apology,' written in reply to his critical adversaries, is perhaps the most finished and correct of his works. The poem called 'Night' was intended as an apology for his own nocturnal habits. These orgies, in which Churchill was associated with the convivial wits of his time, Colman, Thornton, &c., are well described in Charles Johnson's 'Chrysal;' or, the 'Adventures of a Guinea.' The argument of the 'Apology' is bad enough; showing only that the open avowal of vice and licentiousness is less culpable than the practice of it under the hypocritical assumption of sanctified temperance. The 'Ghost,' a poetical satire on the ridiculous imposture of Cook-lane, consists chiefly of a series of rugged Hudibrastic incongruities. 'Pomposo,' in this poem, is intended for Dr. Johnson, who had designated Churchill 'a shallow fellow.' In 1762

Churchill became acquainted with John Wilkes, and contributed to the pages of the 'North Briton.' To gratify his political patron, he wrote the 'Prophecy of Famine; a Scots Pastoral,' which was greatly extolled, not only by Wilkes, and the politicians of his party, who said it was "personal, poetical, and political," but by the literary public: and the admiration of contemporaries has been so far sustained by posterity.

The praise and profit which Churchill obtained by this 'jeu d'esprit' seem to have overwhelmed his common sense: he plunged at once into the greatest irregularities of conduct, which drew from his parishioners a serious remonstrance, and induced him to relinquish the clerical profession. At the same time he quarrelled with and separated from his wife, who herself is said to have been anything but a prude. The utter recklessness of his conduct at this period is shown by his seduction of a tradesman's daughter in Westminster, whom he shortly afterwards abandoned. His poem called the 'Conference' was composed whilst he seemed to suffer some feelings of contrition. He boasted however in letters to his friends that he felt "no pricks of conscience" at his abandonment of his wife or his profession—"the woman I was tired of, and the gown I was displeased with," and throwing aside his clerical habit, he appeared in a blue coat, gold-laced waistcoat, large ruffles, and a gold-laced hat. His satirical 'Epistle to Hogarth' was revenged by the artist's caricature of 'The Reverend Mr. Churchill as a Russian bear' in canonicals, holding a club and a pot of porter, with a pug-dog which is treating the poet's works with great indignity. We have still to mention several poems, all of which are more or less satirical; namely, the 'Duellist;' the 'Author;' 'Gotham;' the 'Candidate;' 'Independence;' the 'Journey;' and 'Farewell.' Of these, the 'Author' is by far the most pleasing and fairest, if it be not in all respects the most powerful. The 'Candidate' is replete with poetical fire and spirit. 'Farewell' is comparatively tame, and 'Gotham,' which was written during a short fit of retirement and reformation, is chiefly descriptive. Churchill was a close and occasionally a very successful imitator of Dryden. His verses have much of the fervour and force of this great poet; and at the same time all the coarseness and ruggedness of Donne and Oldham. Cowper, in a long passage in his 'Table Talk,' assigns him, on the whole, a distinguished place as a poet, calling him a "spendthrift alike of money and of wit." He died at Boulogne in 1765, while on a visit to Wilkes, his intimate friend. His complete works were published in 8vo, in 1804, with a life and portrait. Some interesting particulars are given in 'Genuine Memoirs of Mr. Churchill,' 12mo, 1765. See also Mr. Tooke's 'Memoirs of Charles Churchill,' and Mr. John Forster's able essay on 'Churchill,' republished from the 'Edinburgh Review,' with additions, in Longman's Traveller's Library.

CHURRUCA Y ELORZA, COSME DAMIAN DE, one of the most distinguished naval officers whom Spain has ever produced, was born at Motrico, a sea-port of the province of Guipuzcoa, on the 27th of September 1761. He was intended for the church, but in a stay which he made at the palace of Rodriguez de Arellano, archbishop of Burgos, he met with a naval officer a nephew of the prelate, and from his conversation took a warm attachment to the sea, which he adopted as a profession. His first service, after studying at Cadiz and Ferrol, was in the American war, and he distinguished himself in rescuing from the waves some of the sufferers of the floating batteries at Gibraltar. His knowledge of astronomy afterwards recommended him to an appointment with Don Ciriac de Ceballos in the expedition under Cordoba, sent out by the Spanish government to survey the straits of Magellan, and his diary of the exploration of Tierra del Fuego, which was published at Madrid in 1793, is considered a model of works of the kind. In 1791, though only of the age of thirty, and captain of a frigate, he was appointed to the command of a similar expedition to survey and lay down the coasts of the Gulf of Mexico, but the breaking out of the war between France and Spain prevented his execution of more than a part of the plan. He however took back with him to Cadiz four-and-thirty charts of the coasts of Cuba, Hayti, Puerto Rico, Trinidad, &c., only a few of which have been yet published, but those few are esteemed among the choicest products of Spanish hydrography, which as is well known holds a high rank. They were made use of for the French charts of the Antilles published shortly after, and Churruca had a brilliant reception from Napoleon, then first consul, when not long afterwards sent by his government to Brest. He was bitterly mortified by another compliment paid him by the French, who, on the Spaniards agreeing by treaty to give up to them six vessels which they should select, chose for one of them the 'Conquistador,' Churruca's ship, which it had been for some years his constant study to improve and render efficient. On the 20th of October 1805 Churruca was in command of the 'San Juan,' and left Cadiz in company with the French and Spanish fleets under Villeneuve and Gravina, on the next day took place the battle of Trafalgar. He had written to a friend a few days before, "If you hear that my ship is taken, know for certain that I am dead." His right leg was carried off by a cannon-ball, and he died three hours after with his flag still flying, but soon after his decease the ship surrendered. The English victors, according to the account of Churruca's Spanish biographer, Captain Don Francisco Pavia, showed a respect to the memory of the fallen commander

which did them honour, and it is well to remember that all of the brave who fell at Trafalgar, were not on one side only. A public fountain was dedicated to the memory of Churruca in 1812 in the great square of Ferrol.

CIBBER, CAIUS GABRIEL, a celebrated sculptor, a native of Holstein, was born about 1630, and came to England during the Protectorate of Oliver Cromwell, or shortly afterwards. The two figures of 'Raging' and 'Melancholy Madness,' which adorned the principal gate of Old Bethlehem Hospital, were his work; the statues of the kings and that of 'Gresham' in the Royal Exchange, but most of which perished in the fire which destroyed that building; and also the bassi-relievi on the pedestal of the London Monument. He married as his second wife the daughter of William Colley, Esq. of Glaston, in Rutlandshire, and granddaughter of Sir Anthony Colley, a staunch royalist, who in the cause of Charles I., reduced his estate from 3000*l.* to 300*l.* per annum. By this lady he had Colley Cibber, the actor, dramatist, and poet laureat. Mr. Cibber was employed in the latter years of his life by the Earl, afterwards Duke of Devonshire, in the improvement and decoration of the magnificent family seat at Chatsworth; and at the time of the revolution in 1688, he took arms under that nobleman in favour of the Prince of Orange. He died about 1700. He acquired considerable wealth, and Walpole states that he built the Danish church in London, and was buried there himself, as well as his second wife.

CIBBER, COLLEY, was born, according to his own statement, on the 6th of November, o.s., 1671, in Southampton-street, Covent Garden. In 1682 he was sent to the Free School at Grantham, Lincolnshire. In 1687 he returned to London, and in 1688 was at his father's request received as a volunteer in the forces raised by the Earl of Devonshire in support of the Prince of Orange. In 1689 he indulged an early conceived inclination for the stage, by fixing upon it seriously as his profession; and after performing gratuitously for about eight or nine months, obtained an engagement at a salary of ten shillings per week, which was afterwards increased to fifteen shillings; but a feeble voice and a meagre person were considerable obstacles to his progress, and the trifling part of the Chaplain in Otway's 'Orphan' was the first in which he attracted any attention. His performance of Lord Touchwood at a very short notice, in consequence of Mr. Kynaston's illness, obtained him the commendations of Congreve and five additional shillings per week. At this time, being scarcely twenty-two years of age, after a very short courtship, he married Miss Shore, to the great anger of her father, who immediately spent the greatest part of his property in the erection of a little retreat upon the Thames, which he called Shore's Folly. Mr. Cibber's professional progress was very slow for some years, notwithstanding his having turned author, and the success of his comedies, 'Love's Last Shift,' 'Love makes a Man,' 'She Would and She Would Not,' 'The Careless Husband,' &c. In 1711 however he became joint patentee with Collier, Wilks, and Dogget, in the management of Drury Lane, and afterwards with Booth, Wilks, and Sir Richard Steele; which latter partnership continued till the death of Mr. Eusden, the poet laureat, in 1730, when Cibber was appointed to succeed him, and sold out, having become during his nineteen years' management so great a favourite with the public in the performance of fops and feeble old men, that after he had retired from the stage he was occasionally tempted back to it by the offer of fifty guineas for one night's performance. In 1745 he played Pandolph in his own tragedy of 'Papal Tyranny.' He died suddenly on the 12th of December 1757.

Mr. Cibber has described himself with considerable candour in his well-known and very amusing 'Apology' for his life. Vain, inconsistent, and negligent, he was withal a quick-witted, good-humoured, and elegant gentleman. As a writer of comedy, he is inferior perhaps only to Congreve, Wycherly, and Vanbrugh; but his Birth-day Odes are by no means exceptions to the usual dulness of such compositions. His best comedy is 'The Careless Husband,' the dialogue of which is easy and polished; but the play which brought him the most money was his adaptation of Molière's 'Tartuffe,' entitled 'The Nonjuror,' on which Bickerstaff afterwards founded his 'Hypocrite.' For this play King George I., to whom it was dedicated, sent him 200*l.* He was the author and adapter of nearly thirty dramas of various descriptions, amongst which, besides those already mentioned, we may record 'The Provoked Husband,' written in conjunction with Sir John Vanbrugh, and the modern acting version of Shakspeare's 'Richard III.' His 'Apology' is published in two vols. 12mo, and his dramatic works in five vols. 12mo.

CIBBER, THEOPHILUS, the son of the laureat, was born on the 26th of November 1703. At the age of thirteen he was sent to Winchester school. In 1721 we find him on the stage performing in the 'Conscious Lovers.' He acquired considerable reputation in characters similar to those supported by his father. He married early an actress of the name of Johnson, who died in 1733, and in 1734 he formed a second union with Miss Arno. His extravagant habits forced him to retire to France in 1738, and on his return he separated from his wife under very discreditable circumstances. After twenty years more, passed some in prison and the rest in alternate prodigality and penury, he engaged with Mr. Sheridan of the Dublin theatre, and sailed for Ireland in company with Mr. Maddox, a dancer on the wire, in the month of October 1758. The vessel was however driven by a

storm on the coast of Scotland, and going immediately to pieces. Ciber, his companion, and the greater number of the passengers perished.

Ciber wrote and altered a few unimportant dramas, and was concerned in a work entitled 'An Account of the Lives of the Poets of Great Britain and Ireland,' 5 vols. 12mo, which was published under his name only.

SPERANZA MARIA CIBER was the sister of Dr. Thomas Arne the composer, and made her first appearance before the public as a singer. In 1784 she married Theophilus Ciber, son of the laureat, and in 1786 attempted the part of Zara in Hill's tragedy of that name. Her success was most decided, and she rapidly became a great and deserved favourite: at her death she was by many regarded as the best tragic actress on the stage. She died January 30, 1766, and was buried in the cloisters of Westminster Abbey.

CICERO, MARCUS TULLIUS, was born at Arpinum on the 3rd of January, B.C. 106, in the consulship of Q. Servilius Cæpio and Q. Atilius Serranus, and was thus a few months older than Pompey, who was born on the last day of September in the same year. The family seat was on the south bank of the little stream Fibrenus (fiume della posta), near its junction with the Liris (Garigliano), where the stream of the Fibrenus dividing, forms an island and cascade, the scenery of which is the subject of the dialogue at the beginning of the second book 'De Legibus.' The villa Cicéronis is now occupied as a Dominican convent.

The grandfather of Cicero was living here at the time of the birth of Marcus Tullius, and appears to have been a man of influence at Arpinum, where, on a petty scale, the political disputes formed a counterpart to those at Rome. The old man seems to have entertained the same views of public polity as his son, and vehemently opposed the introduction of the vote by ballot into the municipal proceedings at Arpinum, when a law to that effect was proposed by one Gratiidius, whose family was intimately connected with the Marii, and whose sister, it may be observed, was the wife of old Cicero, and consequently the grandmother of the orator. The matter in dispute was referred to the consul Scæurus at Rome, who expressed his regret that a man of old Cicero's energy should have preferred to exert his talents in a petty corporation rather than on the great theatre at Rome. There is likewise a characteristic saying of his recorded by his grandson, that the men of his day were like Syrian slaves,—"the more Greek they knew the greater knaves they were,"—an observation probably aimed at his opponent Gratiidius, who was well acquainted with that language. This Marcus Cicero had two sons, Marcus and Lucius. The younger of these, together with his uncle Gratiidius, who was killed there, served under Antony the orator in his government of Cilicia. Lucius left a son of the same name, to whom his cousin Cicero was much attached, and whose death he deploras in one of his earliest letters to Atticus.

Marcus Cicero, the father of the orator, though he was on intimate terms with the leading men of the times, was compelled by the delicacy of his health to live in retirement; but this enabled him to pay the more attention to the education of his two sons, Marcus and Quintus. His wife Helvia had a brother, Aculeo, the intimate friend of L. Crassus, a man equally distinguished for his oratory and the public offices he had held; and the two sons of Aculeo, with their cousins the young Ciceros, received their education together under teachers selected by Crassus. It is to this circumstance probably that we must attribute the special direction of Cicero's talents to the study of oratory. He was afterwards removed by his father to Rome, where he had the assistance of Greek instructors, more particularly the poet Archias, who was living under the roof of L. Lucullus. As soon as he had exchanged the boy's dress for the toga he was placed under the care of Q. Mucius Scaevola, the augur, and father-in-law of his father's friend Crassus, and upon his death attached himself to the pontifex of the same name, who excelled all his contemporaries in his knowledge of law, and added to his other accomplishments considerable powers of eloquence. While Cicero was thus preparing himself for the forum, he relieved the severity of his legal and philosophical studies by an intermixture of poetry. Even as a boy he had composed a poem called 'Pontius Glaucus,' which was extant in Plutarch's time, and he now translated the 'Phænomena' of Aratus into Latin verse, besides writing two original poems, one called 'Marius,' in honour of his fellow-townsmen, which received the commendation of Scaevola, and another entitled 'Limón.' But he was now arrived (B.C. 89) at the age when he was called by the laws of his country to the military profession, and he served his first campaign in the Marsic war under Pompeius Strabo, the father of the great Pompey, and was present when Sulla captured the Samnite camp before Nola. The termination of the Marsic war in the following year gave Cicero an opportunity of attending the lectures of two distinguished Greek philosophers; first Philo, who then presided over the Academy, and soon after Apollonius Molo of Rhodes, who had been driven from their homes by the arms of Mithridates. This prince had been long watching for an opportunity of attacking the authority of Rome. The late civil war in Italy had induced him to throw off all disguise. He had overrun the Roman province of Asia, and was already master of nearly all Greece, when the Romans concluded the war with their Italian allies, with the intention of opposing their formidable enemy in the east. But

unhappily that which should have led to a union of their strength was the cause of divisions still more disastrous. The command of the war against Mithridates was disputed between old Marius and Sulla, and led to a series of civil commotions. Sulla however, who was at the time consul, had the important province of that war allotted to him. The appointment excited the furious opposition of the Marian party, and Sulla was unable to maintain the superiority of his party at Rome but by bloodshed and proscription. His departure for the Mithridatic war was the signal for reaction, and Marius re-entered Rome (B.C. 87) with the support of the consul Cinna, and put to death all the most distinguished leaders of the aristocratic party, who were unable to make their escape to Sulla's army in Attica. Cicero's school-fellow Pomponius was probably one of the fugitives, for he left Rome about this period, and by a twenty years' residence in Athens acquired the surname of Atticus. Of Cicero's pursuits during the three or four next years little more is known than that he wrote some rhetorical works, which dissatisfied his maturer judgment; probably the work entitled 'De Inventione,' besides translating the 'Economics' of Xenophon, and several dialogues of Plato. He was also in the habit of declaiming both in Greek and Latin, and received instruction in philosophy and logic from the stoic Diodotus, whom we find afterwards living under his roof, where in fact he died, leaving his property to Cicero. He had also a second opportunity of hearing Molo at Rome, when the philosopher was sent on an embassy to remind the senate of the services of his countrymen in the late war against Mithridates. In his twenty-sixth year (B.C. 81), when Sulla had extinguished all the democratic elements of the Roman constitution, Cicero made his first appearance as an advocate. The speech in favour of Quinctius, though not the first he delivered, is the earliest of those which are now extant. In the following year his voice was first heard in the forum in defence of Sextus Roscius of Ameria on a charge of parricide. The subject matter of the trial was intimately mixed up with the late civil dissensions, so that it attracted much public attention. Cicero fully prepared himself for the occasion, and produced so powerful an impression that, to use his own words, the public voice at once placed him among the first orators of Rome. When he had spent two years in the severe duties of his profession, the delicacy of his health led him to withdraw for a time from Rome. He first visited Athens (B.C. 79), where he devoted six months to Antiochus of Ascalon, the most distinguished philosopher of the old Academy. He also attended Phædrus and Zeno of the Epicurean school, in company with his friend Atticus, and practised declamation under the directions of an able rhetorician named Diogenes of Syria. He next traversed the whole Roman province of Asia, still cultivating his favourite pursuit of oratory under the first teachers of that country; and then crossed over into Rhodes, where for the third time he placed himself under Molo, and derived considerable benefit from his instruction, in correcting the redundancy of his style and moderating the vehemence of his voice and action. He studied philosophy likewise under Posidonius.

In the year B.C. 77, after a two years' absence, during which Sulla had died, Cicero returned to Rome, and married Terentia, whose rank and station in society we may estimate by the fact that her sister Fabia was one of the vestal virgins. He applied himself again with zeal to the law-courts and the forum, in which at this time the most distinguished orators were Aurelius Cotta and Hortensius; but next to them stood Cicero, whose services were in constant demand for causes of the highest importance. But independently of the reputation he was acquiring, he was at the same time opening the way to the political honours of his country; and it is a somewhat singular coincidence that in the year B.C. 76 the three first orators of Rome, Cotta, Hortensius, and Cicero, were successful candidates for the several offices of consul, ædile, and questor, which they respectively filled in the following year. The provinces of the questors being distributed to them by lot, the island of Sicily fell to Cicero's share, or rather the western portion of that island, which had Lilybæum for its chief town; the whole island being under the government of S. Peducæus as prætor, with whom Cicero, and above all Atticus, lived on terms of the closest intimacy, until Peducæus fell with Pansa at the battle before Mutina. Sicily was one of the granaries as it were of Rome, and the questor's chief employment in it was to supply corn for the use of the city; and as there happened to be a peculiar scarcity this year at Rome, it was necessary to the public quiet to send large and speedy supplies. This task Cicero accomplished, he tells us, and at the same time gave the highest satisfaction to all parties in the province. In the hours of leisure he employed himself, as at Rome, in his rhetorical studies; so that on his return from Sicily his abilities as an orator were, according to his own judgment, in their full perfection and maturity. Before he left Sicily he made a tour of the island, and gratified himself by a visit to Syracuse, where he discovered the tomb of Archimedes, which had been lost sight of by his countrymen, and was found overgrown with briars. He came away from the island extremely pleased with the success of his administration, and flattering himself that all Rome was celebrating his praise. In this imagination he landed at Puteoli, and was not a little mortified on being asked by the first friend he met "How long he had left Rome, and what news he brought from thence?" This mortification however led him to reflect that the people of Rome had dull ears, but quick eyes; so that from this

moment he resolved to stick close to the forum, and to live perpetually in the view of his countrymen.

Pompey was at this time carrying on the war against Sertorius in Spain. Nicomedes, king of Bithynia, soon after died, leaving the strange legacy of his kingdom to the Romans; and the King of Pontus, ever ready to avail himself of the dissensions of the Romans, and justified on the present occasion by the Bithynian intrigue, renewed his hostilities by a double invasion of Bithynia and Asia. The two consuls, Lucullus and Cotta, were both sent to oppose him; and while the arms of Rome were thus employed in the different extremities of the empire, a still more alarming war (B.C. 73) broke out at home, which, originating with some gladiators, led to an extensive insurrection of the slaves, and under the able conduct of Spartacus threatened the very existence of the state. During this turbulent period Cicero persevered in a close attendance upon the forum, though none of the speeches which he then delivered have been preserved, excepting those which relate to the prosecution against Verres. Peduceus had been succeeded, after one year's government of Sicily, by Sacerdos, and he, after the same interval, by Verres; for it was a principle of Roman policy to give to as many as possible a share in the plunder of the provinces; though occasionally superior influence, not the merit of the individual, led to a continuance of his government for two or even three years. Such was the case with Verres, who during three years made the Sicilians feel all those evils in their worst form which the Roman principles of provincial administration in bad hands were so well calculated to produce. Cicero had many difficulties to overcome in his endeavours to subject the criminal to the punishment of his crimes. In the first place the *iudices* (jury), under the law of Sulla, would consist exclusively of senators; that is, of those who had a direct interest in protecting provincial mal-administration. Moreover, at the very outset there started up a rival in one Cæcilius, who had been quaestor under Verres, and claimed a preference to Cicero in the task of impeaching him. A previous suit, technically called a *divinatio*, was necessary to decide between the rival prosecutors. Cicero succeeded in convincing the jury that his opponent's object was, to use another technical term, *prevaricatio*, that is, to screen the criminal by a sham prosecution. This previous point being settled in his favour, he made a voyage to Sicily to examine witnesses and collect facts to support the indictment, taking his cousin Lucius Cicero to assist him. Fifty days were spent in their progress through the island, in which he had to encounter the opposition of the new prætor Metellus, who was endeavouring, with many of the leading men at home, to defeat the prosecution. On his return to Rome he found it necessary to guard against all the arts of delay which interest or money could procure for the purpose of postponing the trial to the next year, when Hortensius and Metellus were to be consuls, and Metellus's brother one of the prætors, in which character he might have presided as judge on the trial. Cicero was induced therefore to waive the privilege of employing twenty days in the accusation; and a single speech on the 5th of August, followed by an examination of his witnesses and the production of documentary evidence, produced an impression so unfavourable to Verres that even his advocate Hortensius was abashed, and Verres went forthwith into exile.

The five other speeches against Verres, in which Cicero enters into the details of his charges, were never actually spoken, if we may believe the commentator upon these orations—who passes under the name of Asconius—but were written subsequently at his leisure, partly perhaps to substantiate his charges before the public, but still more as specimens of what he could do in the character of an accuser, which he did not often sustain.

Though a verdict was given against Verres by the jury of senators, yet the past misconduct of that order in their judicial capacity had been so glaring that the public indignation called for the election of censors, whose office had slept for some years; and the magistrates so appointed erased from the roll of the senate sixty-four of that body, expressly on the ground of judicial corruption. To remedy the evil for the future a new law was passed, at the suggestion of the prætor Aurelius Cotta, hence called the *lex Aurelia*, by which the equites (knights) and certain of the commoners (*tribuni aerarii*) were associated with the senators in the constitution of public juries. It was subsequent to the enactment of this law that Cicero made the speeches in defence of Q. Roscius, M. Fonteius, and A. Cæcina. The first of these was the celebrated actor, whose name has since become proverbial. The suit grew out of a compensation which had been made for the death of a slave, whom Roscius had educated in his own profession. M. Fonteius was the object of a prosecution for extortion and peculation (*de repetundis*) in the province of Gallia Transalpina, and must have been guilty, if we may judge from the fragments of his advocate's speech which have come down to us. The cause of Cæcina was of a private nature, and turned entirely upon dry points of law. The ædileship of Cicero (B.C. 69) had little of that magnificence which was so commonly displayed in this office, but it gave the Sicilians an opportunity of showing their gratitude to the prosecutor of Verres, by supplies for the public festivals. After an interval of two years, Cicero entered upon the office of prætor (B.C. 68), and it fell opportunely to his lot to preside in the court of extortion—a court especially provided against that ordinary offence in the administration

of the provinces. The year of Cicero's prætorship was marked by the conviction of Licinius Macer, in opposition to the influence of his kinsman Crassus. But the most remarkable event in his prætorship was the passing of the Manilian law, by which the command of the war against Mithridates was transferred to Pompey, whose claims Cicero supported in a speech which still remains. It was in this year too that he defended Cluentius. This speech likewise exists, and gives a sad spectacle of the uncertainty of life and property at this period. Before the close of his prætorship he betrothed his daughter Tullia, who could not have been more than ten years old, to C. Piso Frugi. She was at present his only child, for his son Marcus was not born until the middle of the following year, which was also the birth-year of Horace.

On the expiration of his office he declined the government of a province, which was the usual reward of that magistracy, preferring to employ his best efforts at home towards the attainment at the proper period of the consular office. This was perhaps his chief object in undertaking the defence of C. Cornelius, the tribune of the preceding year, against a charge of treason, which was supported by the whole influence of the aristocracy. The guilt of Cornelius consisted in his energetic and successful support of the law against bribery in elections, called the *lex Acilia-Calpurnia*. Cicero published two orations spoken in this cause, the loss of which is the more to be regretted as they were reckoned amongst the most finished of his compositions, both by others and by himself. The return of Atticus from Athens at this time was most opportune to his friend Cicero, who looked upon the following year (B.C. 64) as the most critical in his life; and Atticus being intimately connected with the influential men of the aristocratic party, could give essential assistance to a new man, as the phrase was, against six candidates, two of whom were of patrician blood, while the fathers or ancestors of all had already filled public magistracies. Cicero's father just lived to witness the election of his son to the highest office in the state.

From this point the life of Cicero is the history of the times. Of the orations he made in the year of his consulate he has himself given a list in a letter to Atticus.

On the kalends of January, immediately upon his assuming the consular robes, he attacked a tribune, P. Serrilius Rullus, who had a few days before given notice of an Agrarian law. Of this speech, which was addressed to the senate, there exists a considerable fragment, and enough to show that Cicero was already prepared to attach himself to the aristocratic party, whereas up to this time his political life had been of an opposite complexion. His panegyrist, Middleton, seems to acknowledge the change, and attributes his past conduct to that necessity by which the candidates for office were forced, in the subordinate magistracies, to practise all the arts of popularity, and to look forward to the consulship as the end of this subjection. Before the people indeed, to whom he addressed two speeches upon the same subject, Cicero still wore the popular mask; and while he expressed his approbation of the principle of Agrarian laws, and pronounced a panegyric on the two Gracchi, he artfully opposed the particular law in question on the ground that the bill of Rullus created commissioners with despotic powers that might endanger the liberties of Rome, and he prevailed upon one of the other tribunes to put his veto upon the bill. In the defence of Rabirius, who was charged with the murder of the tribune Saturninus three-and-thirty years before, he goes so far as to maintain the right of the senate to place Rome in a state of siege, if we may borrow a modern term, or, in other words, to suspend all the laws which protect the lives of citizens; yet in the same speech he endeavours to curry favour with the people by heaping the highest praises on their favourite Marius. Rabirius had already been convicted by the judges appointed to investigate the charge, but appealed, as the law allowed him, to the people, who accordingly assembled in the Field of Mars to hear the appeal. While the trial was proceeding, it was observed that the flag upon the Janiculum on the other side of the Tiber was lowered. This of necessity broke up the assembly, according to an old law which was made when the limits of the Roman empire extended only a few miles from the city, and was intended to protect the citizens from being surprised by the enemy. The object of this law had long passed away, but Roman superstition still maintained the useless ceremony, and the aristocratic party employed it on the present occasion in the hands of Metellus the prætor to annul the proceedings of justice. The orations in which he defended Otho against the populace, who were enraged at his law for setting apart special seats in the theatre for the order of the knights, and that in which he opposed the restoration of their civil rights to the sons of those who had been proscribed by Sulla, were also delivered this year, but nothing remains of them. Of the conspiracy against Catiline, and the several speeches which were made by Cicero in relation to him, it is unnecessary to say more than will be found under the head CATILINA.

Two other causes, in which Cicero's services as an advocate were called forth during this year, were those in which he defended C. Calpurnius Piso, the consul of B.C. 67, and L. Murena, the consul elect. The oration in defence of Piso is not extant, but it appears that the prosecution was for extortion in his government of Cisalpine Gaul, and was maintained at the instance of Caesar. Cicero, in a speech made on a subsequent occasion, seems to admit the guilt of

his client, and to account for his acquittal on grounds altogether foreign to the merits of the case; another proof of the change that had taken place in the patriotic prosecutor of Verres. His conduct is not less reprehensible in the affair of Murena, who was charged with bribery, treating, and other violations of the law, in his late election to the consulship. His guilt will not be doubtful to a careful reader of his advocate's speech. The prosecution was supported by Sulpicius and Cato, the former a man who may be looked upon as almost the founder of Roman law as a science, and Cato certainly the most honest of his party. Yet Cicero, instead of grappling with the charge, descends to a personal attack on the advocates opposed to him, rallying the profession of Sulpicius as trifling, and the principles of Cato as impracticable. His defence amounts in fact to a defence of the crime rather than the criminal, which was the more discreditable, as he himself had only a few weeks before carried a new law against bribery.

The success of Cicero, in crushing the Catilinarian conspiracy, would probably have earned for him the unmixed good-will of the aristocratic party, had he not offended them by the vanity and presumption which that success engendered, and which were the more offensive to them in one whose origin they despised. So completely was he carried away by his sense of his services to his country that he wrote a history of his consulship in Greek, and even sung his own glories in verse; but the most decisive evidence of his unbounded vanity is the extraordinary letter which he addressed to his friend Lucceius. ('Ad Fam.' v. 13.)

On the other side he had damaged his reputation with the people by his evident change of principles; and the precipitate execution of the conspirators, without the form of a trial, was an offence against the laws of the country which the sanction of the senate could not justify. Already on his laying down his office there were symptoms of that hostility which gradually increased, and in a few years drove him in disgrace from the city which he had lately saved.

But we must return for awhile to his forensic exertions. While the associates in the crimes of Catiline were, for the most part, prosecuted and driven into banishment, it pleased the party of the senate to screen P. Sulla, whose guilt is generally asserted by the historians of the times. Hortensius and Cicero were his advocates, and the support of the latter is reported to have been bought by a loan of money, which Cicero required for a purchase he was then making of a house on the Palatine Hill. To see this in its true light, it should be recollected that the receipt of a fee was at variance with the avowed principles of the Roman bar. The anecdote stands upon the authority of A. Gellius, which might have been insufficient, were it not indirectly yet decisively confirmed by more than one passage in Cicero's letters. In the following year Quintus Cicero, the brother of the orator, was appointed to the government of the rich province of Asia, as successor to L. Flaccus, who came home with the usual reputation for extortion, for which he was called to account two years after. This L. Flaccus had been the chief prætor in the consulship of Cicero, and in that capacity had been of great service in the detection of the conspiracy, so that he had a certain claim upon Cicero, which was not neglected. But this trial was preceded by one of the same nature which more nearly concerned the orator.* C. Antonius, who had been his colleague in the consulship, was recalled from the province of Macedonia, where he had presided for two years, and had to defend himself against an impeachment for the gross rapacity of which he had been guilty. This province had originally fallen to the lot of Cicero, who took credit on many occasions for his disinterestedness in transferring the lucrative appointment to his colleague. He omitted to state that there was a secret agreement between them, by which Antonius bound himself to make a pecuniary return to Cicero; and the extortion of which the proconsul had been guilty was in part owing to this obligation. The very day on which Antonius was condemned was marked by an event still more fatal to the peace of Cicero—the adoption of Clodius, his enemy, into a plebeian family. The object of this ceremony was to render Clodius eligible to the tribunate, from which, as a patrician, he was excluded; and no sooner was the obstacle removed than he offered himself as a candidate, and was elected without opposition. After some little manoeuvring, the cause and object of which are not very intelligible, he made public advertisement of several new laws, which were all aimed at the authority of the senate; and among them was one to the effect that whoever took the life of a citizen uncondemned and without a trial should be interdicted from fire and water. Although Cicero was not named in this law, it was so evidently aimed at him, that it was necessary for him at once to

decide upon the course he would pursue. Some recommended him to resist the law by force, but when he found that Pompey was unwilling to support him, he took the advice of his friends Cato and Hortensius, which coincided with the views of Atticus, and leaving the field to his adversaries, went into voluntary exile. Leaving Rome towards the end of March (a.d. 58), he proceeded to Vibo with the intention of crossing over into Sicily, but from this he was prohibited by the governor, Virgilius, although he was of the same political party, and was under obligations to Cicero. He received about the same time information from Rome that a special law had been passed, which forbade him to appear within a distance of four hundred miles. Under these circumstances he changed his route, and proceeded first to Brundisium, where he was hospitably entertained for some weeks, in defiance of the law. He then crossed over to Dyrrachium, where he was received by Plancius, the quæstor of the province, and conducted by him to Thessalonica. The conduct of Cicero in his exile was such as might have been expected from one whose mind had been so extravagantly elated in prosperity. He gave himself up entirely to despondency; spoke of his best friends as enemies in disguise, not even sparing Atticus and Cato; and so completely lost the control of his feelings and his conduct, that his mind was supposed to be deranged. In the meantime, his friends at Rome, whose fidelity he doubted, were actively engaged in taking measures for his recall. Already on the 1st of June an unsuccessful motion was made in the senate to that effect. The election, too, of his friend Lentulus Spinther to the consulate, offered a brighter prospect for the ensuing year, but in the interval there occurred a little incident which gave him fresh uneasiness. Some of his enemies had published an oration, which he had composed some years before in an angry moment, against an eminent senator, and had shown privately to his intimate friends. Its appearance at so untoward a moment alarmed Cicero, who imagined that it had been destroyed, and he wrote to Atticus requesting him to disavow it. "Fortunately," says he, "I never had any public dispute with him, and as the speech is not written with my usual care, I think you may convince the world that it is a forgery."

Towards the end of the year his residence at Thessalonica became disagreeable to him, and indeed he thought dangerous. His enemy Piso had been appointed governor of Macedonia, and the troops who were to serve under him were already expected. Even before this, some of the accomplices of Catiline, who were living in Macedonia as exiles, had been plotting, it was said, against the life of Cicero. He therefore found it safer to remove to Dyrrachium, where he had friends, although it fell within the distance prohibited by the law. His residence upon this coast afforded an opportunity likewise for an interview with his friend Atticus, who was in the habit of visiting a favourite estate near Buthrotum. While Cicero was harassing himself with perpetual fears and suspicions, his cause was proceeding prosperously at Rome. The tribunate of Clodius terminated in December; the new tribunes were, almost without exception, friendly to his recall; and on the first day of the new year the new consul Lentulus moved the senate for his restoration. His opponents however were not yet driven from the field. The tribunitial veto was employed more than once to check the proceedings. Scenes of riot and bloodshed disgraced the streets of Rome. Yet at last, on the 25th of May, a decree in his favour passed the senate; and on the 4th of August a law, in confirmation of the decree, was carried by the people in the great meeting of the Centuries. Cicero, in anticipation of these measures, had embarked for Italy on the very day the decree of the senate was passed, and landed the next day at Brundisium, where he was received by his daughter Tullia. The inhabitants of the city were profuse in the honours they paid him, and when the news, that the law had passed the Centuries, summoned him to Rome, the inhabitants of the cities through which he passed flocked in crowds to congratulate him.

Cicero's return was, what he himself calls it, the beginning of a new life to him. He had been made to feel in what hands the weight of power lay, and how dangerous it was to lean on the support of his aristocratical friends. Pompey had served him on the late occasion of his recall from exile, and had acted with the concurrence of Cæsar, so that it was a point of gratitude as well as prudence to be more observant of them than he had hitherto been. To the former he took an early opportunity of showing his gratitude by proposing that he should be commissioned to provide for a better supply of corn at Rome, where the unusual price of bread had already occasioned serious disturbances. For this purpose he recommended that Pompey should be invested with absolute power over all the public stores and corn-vents of the empire for five years. The proposition was readily accepted, and a vote passed that a law to that effect should be brought before the people. This law was favourably received by all parties, and Pompey named the proposer of the law the first among his fifteen assistant commissioners; an appointment which the latter accepted, with the stipulation that he should not be called away from Rome. Meanwhile, although Cicero was restored to his former dignity, there was a difficulty in the restitution of his property. The chief delay was about his house on the Palatine Hill, which Clodius had contrived to alienate, as he hoped, irretrievably, by demolishing the building and dedicating a temple upon the ground to the goddess Liberty. The senate therefore could only make a provisional decree, that if the

* We have omitted a mysterious affair which occurred this same year, (a.d. 58). The facts are these:—One Vettius, only known to us before this as an informer of Cicero's in the Catilinarian business, and as having endeavoured to implicate Cæsar on that occasion, is arrested as a conspirator against Pompey's life. He denounces some leading senators, including M. Brutus, as his accomplices, and is thrown into jail. The next day, being again brought out by Cæsar, he includes Lucullus and Cicero in the charge. That same night he is strangled in jail. While some declared he had been suborned and then murdered by Cæsar, others believed the charges made by Vettius, and attributed his death to the command. The authorities are—Cic., 'ad Att.' ii. 24; 'Pro Sextio,' 63; 'In Vatin.' 10; Suet., 'Jul. Cæs.' 17 and 20; Plutarch, 'Lucul.' 43; Appian, 'Bel. Civ.' 12-3; Dion., 37-41 and 38-9.

college of priests discharged the ground from the claims of religion, the consuls should make a contract for rebuilding the house. The pontifical college was accordingly summoned to hear the cause on the last day of September, and Cicero personally addressed them in a speech which he himself considered one of his happiest efforts, and which he thought it a duty to place as a specimen of eloquence in the hands of the Roman youth. The speech however, which now occupies a place among his works under the title 'Pro Domo sua apud Pontifices,' as well as those bearing the names of 'De Haruspium Responsis, post Reditum in Senatu,' and 'Ad Quirites post Reditum,' all professing to have been delivered during this year, have been pronounced by the ablest critics to be spurious. The college gave a verdict in terms somewhat evasive; but the senate concluded the matter by a distinct vote in Cicero's favour, and the consuls immediately put the decree in execution by estimating the damage which had been done to Cicero's property. In this estimate his villas near Tusculum and Formiæ were included. But the estimation was far below what Cicero thought himself entitled to, and he attributed this injustice to the jealousy of the aristocracy, who, as they had formerly clipped his wings, so were now unwilling that they should grow again. Scarcely had the house upon the Palatine begun to rise, when a mob, instigated, according to Cicero, by Clodius, attacked the workmen, and afterwards set fire to the adjoining house, in which his brother Quintus lived. This riot was only one of many which at this time disgraced the city. Milo, as well as Clodius, had his armed bands, and was avowedly seeking for an opportunity of murdering Clodius; while Cicero himself appears as a party in a forcible attack upon the Capitol for the purpose of destroying or carrying off the brazen tablets on which the law of his exile had been engraved. One of those who took an active part in the disturbances was P. Sextius, who in his tribunate had been instrumental in the restoration of Cicero. He was brought to trial for these disturbances the following year, when Cicero, in gratitude, undertook his defence, and obtained an acquittal; and, not satisfied with a mere verdict, he the next day made a furious attack in the senate upon a senator, Vatinius, who had been one of the chief witnesses against Sextius. Cicero was less fortunate in his defence of L. Calpurnius Bestia, who was prosecuted about the same time for bribery in the last election of prætors. In the same year he gratified his powerful friends Pompey and Cæsar by appearing as the advocate of L. Cornelius Ballus, a native of Gades, who had received the citizenship of Rome. The legality of his franchise was the subject-matter of the trial. It is somewhat strange to find Cicero so closely allied as he was at this time with Cæsar, on whom he had showered his abuse on nearly every occasion; but the fact and the disgrace of it are acknowledged by himself repeatedly in his letters to his friend Atticus. "It is a bitter pill," says he, "and I have been long swallowing it, but farewell now to honour and patriotism." There exist two other speeches delivered by him during the same year: one of these was in the senate, on the annual debate about the appointments to the provinces, and he employed the opportunity thus afforded in a furious attack on the private lives and public conduct of Piso and Gabinius, who had been the consuls at the time of his exile, and had assisted his enemy Clodius, and recommended their recall from the provinces they were then governing. He concluded his harangue by defending his alliance with Cæsar. The other speech just referred to was made in defence of Cælius, a man who by his open profligacy and unprincipled conduct was notorious even among his countrymen. He was charged with the crime of procuring the murder of an ambassador from Alexandria, and also of attempting to poison a sister of Clodius. Cælius was acquitted, and lived for many years on most intimate terms with Cicero; indeed the letters that passed between them constitute a whole book in his miscellaneous correspondence. On the return of Piso from his government of Macedonia, at the beginning of the following year, he complained of the attack which had been made upon him by Cicero in the debate about the provinces. Cicero replied to him in another invective, more violent than the former. One would hope that the speech purporting to have been spoken on this occasion was not genuine; for if it is, no one can read it without awarding to Cicero the prize among orators for coarseness and personality; and in fact he takes credit to himself, in his treatise on the perfect orator ('De Oratore'), for his invective powers.

In the spring of the following year he commenced the treatise on politics ('De Republica'), the loss of which the learned had long regretted, when Angelo Maio, in 1823, discovered a considerable portion of it in the Vatican library. The manuscript, which is of parchment, contained a treatise on the Psalms, in a small distinct character; but Maio perceived underneath traces of a larger type, in which he soon recognised the style of Cicero, and the matter, say even the title of the 'De Republica.' But to return to the narrative, the greater part of the year B.C. 54 was employed by Cicero in his usual occupation of defending the accused. "Not a day passes," says he, in a letter to his brother, "without my appearing in defence of some one." Among others, he defended Messius, one of Cæsar's lieutenants, who was summoned from Gaul to take his trial; then Drusus, who was accused of prevarication, or undertaking a cause with the intention of betraying it; after that, Vatinius, the last year's prætor, and Æmilius Scaurus, one of the consular candidates at the time, who was accused of peculation in the province of Sardinia; about the same time

likewise his old friend Cn. Plancius, who had received him so generously in his exile, and being now chosen ædile, was accused by a disappointed competitor of bribery and corruption. All these were, as usual, acquitted; but the orations are lost, excepting the one which he delivered in favour of Plancius, and a considerable fragment of that for Scaurus. This fragment is another of the discoveries of Maio, who found it in the year 1814, with some other fragments of Cicero's orations, in the Ambrosian library at Milan. As was the case with the 'De Republica,' the text of Cicero had been obliterated as much as possible from the parchment to make room for the Latin poem of the Christian writer Sedulius. Cicero's undertaking the defence of Vatinius, who had been always intimately allied with Cæsar, and on that account had on more than one occasion been the object of Cicero's abuse, his personal deformity being a favourite topic of railery with the orator, at once surprised and offended the aristocratic party. They did not conceal from him their disgust, and Cicero found it necessary to make what defence he could of his political tergiversation in a long and ably written letter to his friend Lentulus Spinther, who was then governor of Cilicia ('Ad Fam.' i, 9). The compliment of an epic poem addressed to Cæsar was another proof of the change in his political views; but a still more decisive piece of evidence is furnished by his conduct in relation to Gabinius, who returned at this time from his government of Syria, and was immediately overwhelmed with public prosecutions. Cicero had not forgotten that Gabinius, as one of the consuls at the time of his exile, had supported his enemy Clodius; and he had openly avowed his opinion of his crimes in Syria—crimes, too, which, if we may believe Cicero, included murder, peculation, and treason, in every form; but he was willing to sacrifice both his public and his private feelings at the intercession of Pompey. In the first trial he was called as a witness against Gabinius, but had the prudence to put his evidence in such a form as to give the highest satisfaction to the accused. In the second he became still bolder, and appeared as his advocate, but was unable to save him from conviction, fine, and banishment. The speech delivered by Cicero is not extant, and probably was never published. There is preserved however the speech made by him on the trial of C. Rabirius Postumus, which was an appendix to that of Gabinius. The whole estate of the latter had proved insufficient to answer the damages in which he had been cast; and the Roman law, in such a case, gave the right of following any money illegally obtained to the parties into whose hands it had passed. Rabirius had acted at Alexandria as the agent of Gabinius with Ptolemy, and in that capacity was said to have received part of the ten thousand talents which the king had paid the Roman general as the price of his services. As this trial followed closely upon the preceding, and was so intimately connected with it, the prosecutors could not spare the opportunity of rallying Cicero for the part which he had acted. In the end of the year Cicero consented to be one of Pompey's lieutenants in Spain, and was preparing to set out thither, when he was induced to abandon the appointment, on perceiving from his brother's letters, who was at that time serving in Gallia, that such a step would probably give umbrage to Cæsar, for the recent death of Julia had already broken the chief link which held Cæsar and Pompey together. At the beginning of the following year, news was received of the death of Crassus and his son Publius, with the total defeat of his army by the Parthians. By the death of young Crassus a place became vacant in the college of augurs, for which Cicero declared himself a candidate, and being nominated by Pompey and Hortensius, was chosen with the unanimous approbation of the whole college. This appointment had been for some years the highest object of Cicero's ambition; and the addition to his dignity was of service to him at this time, as he was putting forth all his influence to further the election of his friend Milo to the consulate. The constant disturbances in the city prevented the comitia from being held until the year was closed, and in the middle of January the murder of Clodius by one of Milo's gladiators, in the presence, and at the command too, of his master, placed Milo in a different position. The fury of the people at the death of their favourite broke out in the most violent excesses, which were only aggravated by the endeavours of Milo's powerful friends to screen him from punishment. These disturbances were at last quieted by the appointment of Pompey to the consulship, who was armed too with extraordinary powers by the senate, and finally Milo was brought to trial, condemned in spite of Cicero's eloquence, and banished from Italy. Cicero is said to have been so alarmed on the occasion, by the presence of the military whom Pompey had stationed around the court to prevent any violence, that his usual powers failed him; and indeed the speech which is found among his works, under the title of the defence of Milo, is very far from being that which he actually delivered. In the two trials of Saufeius, one of Milo's confidants, which grew out of the same affair, Cicero was more successful; and he had soon after some amends for the loss of his friend in the condemnation of two of the tribunes, who had been their common enemies, for the part they had taken in the late commotions. One of these, T. Munatius Plancus, Cicero himself prosecuted, which is the only exception, besides that of Verres, to the principle which he laid down for himself of never acting the part of an accuser. It appears to have been soon after the death of Clodius that Cicero wrote his treatise 'On Laws' ('De Legibus'), three books of which are still

preserved; but the work in its original form contained probably, like the 'De Republica,' to which it is a kind of supplement, as many as six books for ancient authors have quoted from the fourth and fifth. But the civil and literary pursuits of Cicero were soon interrupted by the demand for his services abroad. Among the different laws which Pompey brought forward for checking the violence and corruption which the candidates employed for the attainment of public office, was one which disqualified all future consuls and praetors from holding any province until five years after the expiration of their magistracies. But before the law passed, Pompey procured an exception for himself, getting the government of Spain and Africa continued to him for five years longer; while, to gratify Caesar on the other side, Cicero, at the special request of Pompey, induced one of his friends to bring forward a law by which Caesar's presence might be dispensed with in suing for the consulship in the following year. There was valid ground for this privilege being conferred upon Caesar in the circumstances of the Gallic war, where the success of the Roman arms would have been seriously endangered by his absence. Thus Cicero and Pompey were the chief instruments in passing the very law which they afterwards declared unconstitutional and invalid, and so brought upon their country the horrors of civil war. As the magistracies of the time being were precluded from provincial government by Pompey's law, it was provided that for the next period of five years the senators of consular and praetorian rank, who had not held foreign command upon the expiration of their magistracies, should divide the vacant provinces by lot: in consequence of which Cicero most reluctantly undertook the government of Cilicia, with which were united Pisidia, Pamphylia, Cyprus, and three dioceses, as they were called, of the adjoining province of Asia. Thus Cicero found himself in the very position which it had ever been one of his chief objects to avoid, and his friends were the more uneasy as that quarter of the empire was threatened by the Parthians in revenge of the late invasion of their territories by Crassus. Under these circumstances Cicero was fortunate in having among his lieutenants two such men as his brother and Pontinius. The latter had established a high military reputation by his successes and triumph over the Allobroges, while the merits of Quintus Cicero as a soldier had been proved and acknowledged by Caesar in Gallia.

Still the government of a province was suited, neither to the taste nor the talents of Cicero, and he urged all his friends before his departure, as well as in nearly every letter he subsequently wrote, not to allow the command to be extended beyond the year which the law of Pompey required, or the year itself to be lengthened out by the caprice of the pontifical college; for the length of the Roman year at this time varied according as it was the pleasure of that body to insert more or less intercalary days in the month of February, and the Pontifices were guided in this not by any fixed rule, but by private motives, lengthening or shortening the year to favour a friend or injure an enemy.

Cicero left the city about the 1st of May, and on his arrival at Tarentum paid a visit to Pompey, with whom he had a conference on the serious aspect of affairs, and was assured by him that he was prepared for the dangers which threatened them. In the middle of June he proceeded from Brundisium to Corcyra and Actium, thence partly by land and partly by water to Athens, where he spent ten days, and then crossed in fifteen days to Ephesus, touching at several islands on the way. He had here a foretaste of the duties he would have to perform; for among the deputations which waited upon him at his landing was one from the citizens of Salamis in Cyprus, to lay before him their complaints against the extortion and cruelty of a Roman citizen named Scaptius, who had claimed from the city a large sum upon a bond, together with an accumulation of interest at the rate of forty-eight per cent.; and who had used the military authority he had held under the late governor, Appius, to besiege the senate of Salamis in their council-room, until five had died of starvation. As Brutus had recommended the interests of Scaptius to Appius, who was his father-in-law, so he now laboured to place him in the same degree of favour with Cicero, and was seconded in this suit by the letters of Atticus; but the extortion raised Cicero's indignation, and he resisted the claims of Scaptius, though Brutus, in order to move him the more effectually, at last confessed what he had all along dissembled, that the debt was really his own, and Scaptius only his agent in it.

Cicero however was the friend of justice up to a certain point only, for when he refused the usurious interest, Scaptius in a private interview told him that though the principal was only 100 talents, the Salaminians through some mistake believed it to be 200, and suggested that Cicero might safely give an award for the larger sum. Cicero himself gives us this anecdote in his letters to Atticus (v. 21), adding that he assented to the proposal, but was unable to effect the object because he found the Salaminians more precisely acquainted with the accounts than Scaptius had anticipated. This same Brutus, whose character is so commonly put forward as one of the finest examples of Roman virtue, had applied for the assistance of Cicero in another affair of a nature somewhat similar. The King of Cappadocia, whose empty offices proved how dearly he paid for the protection of the Roman senate, owed him, he said, a very large sum of money. But Cicero was unable to render him the least assistance in the recovery of this money, as the king owed a much larger sum to Pompey, whose position in the political world at Rome gave him a higher claim, and

yet was unable to pay him the full interest of the debt. These instances afford a good example of the miseries which resulted from the Roman form of provincial government. But Cilicia had felt these miseries in a degree more than usually severe under the late governor Appius, the traces of whose extortion were visible everywhere, and could only be compared, says Cicero, to the track of a wild beast. Indeed he found employment enough in healing the wounds which Appius had inflicted. Cicero appears not to have concealed his feelings upon this subject: at any rate the accounts which reached Appius led him to believe that Cicero was encouraging his enemies at Rome in their determination to bring him to public trial; nor could he believe the protestations of Cicero to the contrary, when he found his prosecutor Dolabella was about to be married to Cicero's daughter. He again expostulated, but Cicero replied to his complaints by disclaiming all knowledge of any such matrimonial negotiation, the falsehood of which is demonstrable from the letters which he wrote at the same period to Atticus. But Appius and Pompey were allied by the marriage of their children, and the latter induced Cicero to promise everything from the province that could be of service to the accused, so that the guilty governor was acquitted without difficulty. The military proceedings of Cicero were not of a very interesting nature. He had proceeded at once on his arrival in the province to the south-eastern frontier, which was threatened by the Parthians; but the Roman officer who commanded in the adjoining province of Syria had so completely occupied the attention of the enemy, that Cicero's troops never came in sight of them. Being unwilling however to let the army return into winter-quarters without effecting anything, he attacked some of the mountain tribes of Amanus, whose position had hitherto protected them, and took a number of prisoners; while his troops had a pretext for saluting him 'imperator.' He was also successful in the siege of a robber-fort called Pindenissus, for which his friends at Rome obtained him the honour of a public thanksgiving. His other services in Cilicia include nothing deserving especial notice, and he was happy when the year of his appointment expired, and enabled him to return to Italy. He landed at Brundisium towards the end of November, displaying his laurel-wreathed fasces, for his friends, and among them Pompey, flattered him with the notion that his eminent military services deserved nothing less than a triumph. But when he reached the neighbourhood of Rome on the 4th of January, he found matters of a more serious nature in agitation. The senate had just passed a decree that Caesar should dismiss his army, and when M. Antony and another tribune opposed their vote to it, proceeded to that vote which gave the consuls and other magistrates a power above all the laws. The tribunes fled to the camp of Caesar, who, considering this decree as equivalent to a declaration of war, advanced with a rapidity which destroyed all the arrangements of the senate. The consuls fled from Rome, accompanied in their flight by Cicero and the leading men of the aristocracy, in the hope of defending the southern part of the peninsula. With this view the principal senators had particular districts assigned to them, Cicero undertaking to guard the coast south of Formis and the country around Capua; but the rapid advance of Caesar drove Cicero from his purpose. He disavowed the military engagement he had undertaken to fulfil; made different excuses for not joining Pompey in his march to Brundisium; and finally, when Caesar made himself master of Corfinium, and by his magnanimous liberation of Lentulus Spinther, and other senators, gave the lie to those reports of his cruel intentions which his enemies industriously circulated, Cicero deemed it a favourable opportunity to open a negotiation with Caesar, under the pretext of thanking him for his generosity to his friend Lentulus. In the middle of March Pompey sailed from Brundisium, abandoning Rome and Italy to his opponent. The return of Caesar from Brundisium to the capital afforded an opportunity for an interview, in which it appears to have been stipulated that Cicero should remain in Italy, and observe a strict neutrality.

When Caesar proceeded to Spain to oppose the Pompeian troops under Afranius, he left Antony in command of Italy, with especial directions to watch the movements of Cicero, who, residing upon the coast, occasionally showed symptoms of a disposition to slip off and join Pompey in Greece. This vacillation was not unobserved by Antony, and drew from him a monitory letter; but in vain. An account of some temporary success obtained by Afranius in Spain, magnified by himself and injudicious friends into a certain prospect of speedily destroying Caesar and his army, led many of the wavering to fly from Italy to the camp in Greece. Cicero appears to have been one of these; at any rate he made his escape in the early part of June, and met with a cold welcome from the army of the senate. He was not present at the battle of Pharsalia, having stayed behind at Dyrrachium, where he received the news of that decisive engagement, and, refusing to join those who determined to cross over into Africa with the intention of still maintaining the war, he again committed himself to the mercy of the conqueror, and landed at Brundisium at the end of October B.C. 48. Here he passed many miserable months, the laurels upon his fasces drawing upon him an attention which he would gladly have avoided, while the news of Caesar's difficulties in Egypt and the successes of the Pompeians in Africa again inclined the balance of the war. All this time he had received no intimation of pardon from Caesar himself, though he was assured of his safety by Caesar's

friends. On the other hand, should the Pompeians ultimately succeed (and they were already talking confidently of coming over from Africa into Italy), he was sure to be treated as a deserter, for he well knew that while Caesar pardoned even his enemies when they submitted to his power, it was a declared law on the other side to consider all as enemies who were not actually in their camp. After a long series of mortifications, he was cheered at last by a kind letter from Caesar himself, and still more when Caesar landed at Brundisium after his successful expeditions in the east, and gave him a reception which at once removed his fears and induced him to follow the conqueror to Rome. About the end of the year Caesar embarked for Africa, and again the empire was in suspense; for the name of Scipio was thought ominous and invincible on that ground. Cicero, to relieve his mind, now shut himself up with his books, and entered into a close friendship with Varro; a friendship which was consecrated by the mutual dedication of their learned works to each other—of Cicero's 'Academic Questions' to Varro, of Varro's 'Treatise on the Latin Language' to Cicero. One of the fruits of this leisure was his dialogue on famous orators, called 'Brutus,' in which he gives a short character of the chief orators of Greece and Rome. But though the work was finished at this time, it was not made public till the year following after the death of his daughter Tullia.

He now parted with his wife Terentia, who had lived with him more than thirty years; and whatever may have been the causes or pretexts for this separation, he exposed himself to no little suspicion by marrying, almost immediately after, a young ward named Publilia, possessing much beauty and very considerable property, over which he had been placed as trustee by her father's will. Terentia subsequently married Sallust, the historian, and even after his death again entered the marriage state once, if not twice. She is said to have lived to the age of 103. Amid these domestic troubles, Cicero perhaps found some consolation in the marked attention paid to him by Caesar, who returned victorious from Africa in the summer of B.C. 46; but any gratification he may have derived from this source must have been diminished by his consciousness of the offence he was giving to his former friends through his close intimacy with the dictator. The panegyric which he composed about this time in honour of Cato has indeed often been alleged as a proof of his being no temporiser; but if the treatise had come down to us, we should probably have found that Cicero had succeeded most happily in blending his eulge upon the conquered with a well-tempered flattery of the conqueror. That he possessed this happy and useful talent is apparent from the speech he delivered at this time in favour of Ligarius, and the defence of Marcellus might be put in evidence to the same effect, if there were not strong grounds for doubting the authenticity of the oration bearing that name. At the end of the year Caesar was called away in great haste into Spain to oppose the sons of Pompey; and young Cicero requested his father's permission to go to Spain, that he might serve under Caesar with his cousin Quintus, who was already gone thither. Cicero objected to his serving in arms against their former friends, and thought it more desirable that he should go to Athens to devote a few years to philosophy and literature. Soon after he had parted from his son, whom he was doomed never again to see, he was oppressed by the severest affliction, the death of his daughter in child-bed. Tullia had been thrice married; first to Piso, who died about the time of Cicero's return from exile, and then to Crasipes. For her third marriage with Dolabella both parties qualified themselves by a divorce from their consorts; and at the time of her death arrangements for another divorce had been carried so far that her father was already applying for payment of an instalment upon her dowry.

In this new grief Cicero drew little comfort from the condolence of his friends. All the relief that he found was in reading and writing, and he composed a treatise 'Of Consolation' for himself, which was much read by the fathers of the Christian Church, especially Lactantius, to whom we are indebted for the few fragments that remain. His domestic grief was completed by the misery of his ill-assorted marriage which he was happy to dissolve after a union of less than a year. In this desolate condition he fled as usual to his books, and no period of his life produced a richer literary harvest. He has himself given us a list of the works which he wrote in this and the following year. ('De Div.' ii, 1.) The 'Orator' completed his rhetorical works, forming a sort of supplement to his three books entitled 'De Oratore,' and the 'Brutus.' His philosophical writings of this period were, the 'Hortensius,' so called in honour of his deceased friend, in which he recommends the study of philosophy; four books in defence of the Academy, dedicated, as has been already mentioned, to Varro; five books entitled 'De Finibus,' and addressed to Brutus, in which he contrasts the opinions of the different sects of philosophy on the subject of the summum bonum; the Tusculan disputations, in the same number of books, on a variety of points which involve the happiness of human life; three books on the Nature of the Gods; one on Divination, or the art of seeing into futurity; another on Fate; and the beautiful treatise on Old Age. These were followed by an essay on Glory, which has been lost since the invention of printing; the 'Topica,' addressed to his friend Trebatius; and the 'De Officiis,' which was dedicated to his son.

The publication of these works extended over the years 45 and 44

B.C. In the autumn of the former of these years Caesar returned from Spain, and Cicero was induced to quit his retirement and come to Rome, where he soon after exerted his talents in the service of an old friend, Deiotarus, king of Galatia, who had incurred the displeasure of Caesar by his firm support of the Pompeians, and indeed was charged with having formed a plot to assassinate Caesar a few years before. Cicero failed in obtaining pardon for his friend; but his intimacy with the Dictator seemed daily to be increasing, when the Ides of March changed the whole face of affairs. Cicero was present at the scene of assassination in the senate-house, where he had the pleasure, he tells us, of seeing the tyrant perish; but the conspirators were grievously disappointed in the results of their crime. As soon as the first stupor had passed away, the public indignation drove the murderers from Rome, and Cicero himself deemed it prudent to make a temporary retreat. He proceeded first to Rhegium, then crossing to Sicily, on the 1st of August he arrived at Syracuse, whence he sailed next day, and was driven back by cross winds to Leucopetra. Here he met with some people lately from Rome, who brought him news of an unexpected turn of affairs there towards a general pacification, so that he was induced to set out immediately on his return. He touched at Velia, where he had his last interview with Brutus, and arrived at the capital on the 31st. The senate met the next morning, but Cicero, not finding things in the favourable state which he expected, was unwilling to meet Antony, and excused himself from attending, as being indisposed by the fatigue of his journey. The next day Antony was absent, and Cicero delivered the first of those orations which he called Philippics, as being rivals of the invectives which Demosthenes directed against the King of Macedon. The violence of this harangue committed him with Antony, and he again retired for security to some of his villas near Naples, where he composed and published the second Philippic. This speech, if that name can be given to what was never spoken, was a furious invective, well charged with falsehood, against the whole life of Antony, and was supposed to have been the chief cause of Cicero's death. The departure of Antony for Cisalpine Gaul left Rome again open to Cicero, who returned there on the 9th of December, and ten days after delivered his third Philippic, the chief object of which was to procure the sanction of the senate to the late proceedings of Octavianus in opposition to Antony. Having effected this object, he passed into the forum and harangued the people upon the same subject in his fourth Philippic. The ten other speeches bearing this name were delivered from time to time in the senate or the forum, to excite the people of Rome against Antony and his friends; but the prospects of the oligarchy were finally disappointed by the treachery of Octavianus and Lepidus in joining their arms to Antony, and thus sharing the whole power of the state among them. The proscription which followed, though it can in no way be justified, was levelled against men who had been themselves assassins, or the avowed advocates and panegyrists of assassination. Cicero himself had lauded the murderers of Caesar as the greatest benefactors of their country; nay, it is doubtful whether he was not himself privy to the conspiracy, though he may have wanted the courage to use the dagger himself; and afterwards when he found Antony in his way, he repeatedly expressed his regret that the conspirators had not served up one more dish at the glorious feast of the Ides of March. Cicero was at his Tusculan villa with his brother and nephew when he received the news of the proscription, and of their being included in it. He fled to Astura on the coast, where he found a vessel ready to receive him, in which he immediately embarked, but was compelled by the weather to land again the same day near Circelli. The following day he embarked a second time, but again landed at Caieta, whence he proceeded to his Formian villa. In the middle of the night his slaves informed him of the approach of the soldiers who were intrusted with the murderous commission; he made an attempt to escape in a litter, but being overtaken in a wood, the scene was speedily finished. The assassins cut off his head and hands, says Plutarch, and carrying them to Rome, presented them to Antony, who had them fixed up on the rostra in the forum. Cicero was killed on the 7th of December, in the year B.C. 43.

The works of Cicero have been repeatedly published in mass, as well as separately, but perhaps the best edition of his entire writings is that by Orellius. Of his separate works the following editions deserve particular notice. The 'Variorum,' as it is called, by Gravivius, containing the Orations, the Letters ad Familiares and ad Atticum, with one volume of his Philosophical Works. The notes of Manutius are exceedingly valuable. 2, 'De Divinatione et de Fato,' G. H. Moser; 3, 'De Legibus,' Moser et Kreuzer; 4, 'De Naturâ Deorum,' by the same; 5, Ditto, by Heindorf; 6, 'De Republicâ,' by Moser; 7, 'Oratio pro Cluentio,' by Classen; 8, 'Pro Milone,' by Orellius, 1826; 9, 'Pro Plancio,' by Wunder; 10, 'Orationes Philippicæ,' by Wernsdorff; 11, 'The Orations,' by Garatoni, at Naples; and the 'Orations,' 3 vols. 8vo, and 'Cato Major sive de Senectute, Lælius sive de Amicitia, et Epistolæ Selectæ,' by Mr. G. Long. To those who value a correct text, Wunder's Collation of the Erfurdt Manuscript, published at Leipzig in 1827, will be of great service. The critical writings of Madvig of Copenhagen are also deserving of study, together with his excellent 'Disputation on Asconius.' Mention has been made of the doubts as to the genuineness of certain of the Orations. F. A. Wolf has

examined the claims of the four Orations, 'Post Reditum in Senatu,' 'Ad Quirites post Reditum,' 'Pro Domo sua,' and 'De Haruspium Responsis,' in a volume published at Berlin in 1801. In the following year he published an edition of the 'Pro Marcello,' with his reasons for believing it to be spurious. In regard to the letters 'Ad Brutum,' see BAURON. The student of Cicero's writings should also possess the account of his 'Life,' by Conyers Middleton. It has been freely employed in this article, but the strong bias of the author in favour of his hero has been throughout corrected from the writings of Cicero himself, more particularly his letters to Atticus, which having been written in confidence to an intimate friend, and never intended for publication, furnish a test for trying the character of the writer such as few public men could stand with impunity. Middleton has made two great errors in forming his notion of Cicero and the men who lived in his times. He has believed all that he has said of himself, and all that he has said of his enemies; and besides this, he has, with something of dissimilarity, softened down those points where he has unintentionally borne evidence against himself. The translations of Cicero's writings in English are not of great merit. One of the best is Melmoth's translation of the 'Letters;' but his style is too florid. The French language possesses an excellent translation of the 'Letters to Atticus,' by the Abbé Mongault, accompanied by a Commentary no less excellent; and the German language has a still more valuable translation of all the 'Letters' in chronological order, by Wieland, with notes, and a number of historical chapters, which are tainted however with an undue partiality to Cicero. A most laborious and useful work for the student of these times, but still retaining much of the same prejudices, will be found in the 'History of Rome, in its transition from a republican to a monarchical form of government; or Pompey, Caesar, Cicero, and their Contemporaries,' by Professor Drumann, of Königsberg. The work is drawn up in an alphabetical order according to the gentile names.

CICOGNARA, COUNT LEOPOLD, was born at Ferrara, November 26, 1767, and, although the inheritor of considerable wealth, began early to distinguish himself by his application to study. While yet a youth he made considerable proficiency in mathematics and physics, whereby he recommended himself to the notice of Spallanzani, Scarpa, and many other eminent individuals at the university of Pavia. Having completed his course of studies there he proceeded to Rome, where he occupied many years not only in studying the great works of art, but likewise in practising himself both in drawing and painting, for which he had almost from his boyhood manifested more than ordinary talent. After visiting Naples and Sicily, in which latter country he published, at Palermo, his first literary effort, a poem, entitled 'Le Ore del Giorno,' he successively visited Florence, Milan, Bologna, and Venice, for the purpose of making himself thoroughly acquainted with the various treasures of art in those cities. In 1795 he fixed himself at Modena, and during the twelve following years appears to have given much of his attention to public affairs, having been for some time minister at the court of Sardinia. He resigned his post in 1808, when he was made president of the Academy of the Fine Arts at Venice; an office for which he was well qualified no less by the public-spirited zeal with which he discharged it than by his knowledge of art itself and the literature belonging to it. From this epoch in his life may be dated the commencement of his career as a writer, during which he enriched the branch of literature just mentioned by many important works. In the same year (1808) he published a treatise on 'The Beautiful' ('Il Bello'). This was succeeded by his great work, 'The History of Modern Sculpture' ('Storia della Scultura dal suo risorgimento in Italia al Secolo di Napoleone'), an undertaking to which he had been urged by his friends Giordani, D'Agincourt, and Schlegel. It is in three folio volumes, the first of which appeared in 1816, and the last in 1818, and contains about 180 outline plates, exhibiting a vast number of subjects from the earliest period—the age of the Pisani and Donatello—to that of Canova, to a notice of whose works the whole of the seventh or last book is devoted. Although not without defects, it is undeniably a performance of great research and erudition, bringing down to the present century the history of the art from the point at which it had been left by D'Agincourt, who himself had taken it up where Winckelmann had quitted it. Besides a vast body of information as to the professed subject, this work also embraces much subsidiary matter of great interest, particularly the descriptive and historical notices of St. Mark's at Venice, the cathedrals of Milan and Orvieto, St. Peter's, and many other Basilicas.

His next publication was a catalogue raisonné in two thick 8vo volumes of his own library, an immense collection of works in every department of the fine arts. This is a most valuable addition to bibliography, and shows that Cicognara spared no cost in the pursuit of his favourite studies. He likewise produced a work entitled 'Memorie per servire alla Storia della Calcografia,' and contributed numerous articles relative to subjects of art and artists to various journals. Even had he produced none of the works above enumerated, the name of Cicognara would have been transmitted to posterity with honour by the two splendid architectural volumes entitled 'Le Fabbriche più Cospicue di Venezia,' 1815-20, of which the greater share of the literary part and the chief conduct of the work belong to

him, although he was assisted in it by Diedo and Selva, who furnished the accounts of many of the buildings. It is illustrated with 250 engravings of all the most interesting structures of Venice. Cicognara died at Venice of a disease of the lungs, March 5, 1834, and his obsequies were performed with great solemnity in the cathedral of St. Mark.

CID. The adventures of this famed Castilian hero are nearly as much involved in fable and romance as those of our King Arthur and his Knights of the Round-Table, nor is it easy at this distance of time to separate the truth from the exaggeration of tradition and the inventions of ballad-writers. Ferreras and one or two other Spanish writers think however that they have established the following facts:—

The Cid (from the Arabic El Seid, 'the Lord') who was so called by the Moors of Spain whom he subjugated by his victories, was born at Burgos somewhere about 1040: his real name was Rodrigo Diaz de Bivar. He attached himself to Sanchez II., king of Leon and Castile, whose life he once saved in battle. At the siege of Zamora, Sanchez was treacherously slain, and his brother Alfonso, the next in order of succession, was suspected of the deed. The Cid insisted that, before taking possession of the vacant throne, Alfonso should purge himself by taking an oath of his innocence of his brother's murder; and when the rest of the nobles hung back, he alone exacted and made the king repeat the vow, to which he added the most awful maledictions in case of perjury. After such a step he could expect little court favour, and the state of Spain encouraged his propensities to war and adventure. His life was a continued series of combats with the Moors, who occupied by far the largest and richest parts of the country. He fell upon them in Aragon, burning, plundering, and slaughtering wherever he went; he took Alcocer, and making that place his stronghold, he was gradually joined by a numerous band, half patriots, half freebooters, with which he made innumerable incursions into the neighbouring territories of the Moors. Still gathering force, he penetrated to the district of Ternel at the south-western extremity of Aragon, and there established himself in a strong fortress on a rock, which is still called 'La Peña de el Cid' ('The Rock of the Cid'). By the sudden death or murder of the Moorish lord of Valencia, he was encouraged to extend his incursions into that province, and to the shores of the Mediterranean. Here too he was eventually enabled to establish himself. After a long siege he took Valencia, the capital city, and held it until his death, which happened about 1099.

The Cid appears to have really had a wife named Ximena, the Chimène of the celebrated French tragedy 'Le Cid,' but the story of his affecting courtship, and the struggle and contrast of affections in the heart of his mistress, are mainly inventions of Corneille. The Spanish chronicles and ballads from which the French tragedian took the notion of his plot, or from a drama founded upon them, do indeed relate that the Cid had killed Ximena's father; but they destroy all interest in the heroine by saying that after her father's death, and before any tender addresses on the part of his slayer, she earnestly begged the king to marry her to the Cid, "because," she is made to say by these naive writers, "I am quite certain that his possessions will one day be greater than those of any man in your dominions."

The original 'Cronica de el Famoso Cavallero Cid Ruy Diaz Campeador' is supposed to have been written in the 13th century, about 150 years after the hero's death. Mr. Southey in his curious work makes use of a printed edition of 1593, and says the first and only other edition was printed in 1552; but there is a copy of an edition in the library of the British Museum which bears the date of 1541.

The 'Poema de el Cid,' which is believed to contain rather more historic truth than the prose chronicle, was written about the middle of the 12th century, or only some fifty years after the Cid's death. The author has been called the 'Homer of Spain,' but his name has not been preserved. Though scarcely justifying the extreme praise of Southey, who terms it "the oldest poem in the Spanish language, and beyond comparison the finest," the 'Poema' contains some powerful passages, and is highly interesting from its undoubted antiquity.

Besides this poem the Spaniards have an immense number of romances and ballads relating to the exploits of the national hero. No fewer than 102 of these are in the real old style of the 13th and 14th centuries; many are evidently more modern, and many more have never been printed. In some of these ballads the wonderful achievements of Bernardo de el Carpio, Ferran Gonzalez, and the rest of the twelve peers (for Spain had her twelve 'peerless' knights as well as Britain and France), are interwoven with the adventures of the great Cid. An ample notice of these different works will be found in Mr. Southey's 'Chronicle of the Cid,' 1 vol. 4to, 1808. See also Lockhart's 'Spanish Ballads,' and 'the Cid' by G. Dennis.

CIGNANI, CARLO, was born at Bologna, May 15, 1628. His father was a notary, but claimed his descent from an old Ghibelline family of Florence, who had been driven from their native city by the Guelphs. Carlo, who showed an early taste for painting, was put under Giambattista Cairo for instruction. He soon surpassed his master, and was removed to the care of Albani, under whom he rapidly rose in reputation and success. He subsequently enlarged his style of painting by a careful study of the works of Correggio and Annibal Caracci, from whom he learned the art of giving size and space to his pictures, by means of a powerful and skilful use of *chiaroscuro*. Cignani had a singular degree of prosperity; commissions crowded

upon him, he enjoyed the friendship and correspondence of many of the reigning princes of his time, and acquired great wealth. He was also made a count by Ranuzio II., his native sovereign.

Being invited to paint the Duomo of Forlì, he removed thither with his family, and resided there for the remainder of his life. While Forlì was occupied by some German troops during the war between the pope and the emperor, Cignani presented a picture to the commander of the forces, who in return, besides a handsome gift in money, issued an extraordinary order to his troops to refrain in every way from molesting the good people of the city. The citizens testified their gratitude to Cignani by enrolling him among their nobility. In 1708, when the Clementine Academy was instituted, Cignani was elected president. He died September 6, 1719, leaving two sons, one of whom, Felice, was a painter.

Cignani painted an infinite variety of subjects—sacred, classical, and even comic. His colouring is pleasing and brilliant, and his finish most elaborate. His chief work is the Duomo at Forlì, an immense composition, ingeniously disposed, which represents the 'Assumption of the Virgin.'

CIGNAROLI, GIAMBETTINO, one of the most distinguished of the Italian oil-painters of the 18th century, was born at Salò, near Verona, in 1706. He studied first under Santo Prunati, and afterwards, according to report, with Balestra. There are several excellent works in oil by Cignaroli in Verona, Pontremoli, Pisa, and at Parma. In the last-named place there is a 'Journey into Egypt,' in the church of Sant' Antonio Abate, much praised by Lanzi. In his style Cignaroli resembled Carlo Maratti, but he was inferior to him in colouring: his carnations are occasionally green, with shadows and half-tints, and sometimes too red. He was a great admirer of the works of Guido and of Correggio. With the exception of some works executed in his youth in Venice, he did not paint in fresco; he found the practice injurious to his health.

Cignaroli lived chiefly at Verona, where he educated a numerous school, and he died there in 1770, possessed of considerable wealth. He executed several works for other places, and had several invitations to visit foreign courts, all of which however he declined. In 1769 the emperor Joseph II. visited Cignaroli in his studio, and observed afterwards, that in Verona he had seen two very rare things—the amphitheatre and the first painter of Europe.

He is said to have been a very accomplished man; he was a poet and a writer upon art. A good collection of books on the arts was bequeathed by him to the Academy of Verona, which preserves his bust. A very flattering memoir of him, by Padre Ippolito Bevilacqua dell' Omtorio, was published at Verona in 1771, the year after his death.

CIGOLI, LUDOVICO CARDI DA, Cavaliere, a very celebrated Florentine painter, was born at Cigoli in 1559. He was one of the great reformers of style of the Florentine school, and one of those masters whose works formed an epoch in the history of painting in Tuscany. Cigoli was the first who successfully opposed the anatomical school of the imitators of Michel Angelo, and he was seconded in his efforts by his friend Gregorio Pagani.

Cigoli was the scholar of Santo di Titi, but his style was founded upon the works of Barroccio and Correggio, and had much in common with the eclectic school of the Caracci. His drawing was generally correct, and in colouring and chiaroscuro he was superior to Barroccio, but inferior to Correggio, especially in local tones. His chief productions are large altar-pieces, some of which are among the finest pictures in Italy. The 'Lame Man healed by St. Peter,' in St. Peter's at Rome, painted for Clement VII., is a very celebrated work, though now destroyed, and was pronounced by Andrea Sacchi the third picture in Rome: the first being the 'Transfiguration' by Raffaele, and the second the 'Communion of St. Jerome' by Domenichino, now hanging opposite to each other in the same room in the Vatican. There is also at Florence a 'Martyrdom of St. Stephen,' at the Nuns of Monte Domini, which Pietro da Cortona pronounced to be one of the finest pictures in Florence. The 'Lame Man Healed' has been engraved by Dorigny, Callot, and Scacciati. As a fresco-painter, Cigoli was not successful. He was also an architect; and he wrote a practical treatise on perspective, 'Prospettiva pratica di Ludovico Cigoli Cav. e Pittore,' with diagrams engraved in copper by his brother Bastiano Card. He invented a perspective-machine, for drawing objects in perspective from nature without the assistance of rules. Cigoli died at Rome in 1613, shortly after the completion of some frescoes painted for Paul V., in that pope's chapel in the church of Santa Maria Maggiore. Cigoli was himself dissatisfied with his works, and wished to repaint them, but the pope would not permit him. He was a Cavaliere of the Tuscan order of San Stefano, and a Knight of Malta.

(Baldinucci, *Notizie dei Professori del Disegno*, &c.; Lanzi, *Storia Pittorica*, &c.)

CIMABUE, GIOVANNI, was born at Florence, in the year 1240, of a noble family. During his youth he was sent by his father to study letters at the convent of Santa Maria Novella. When some Greek artists came to ornament the convent-church with paintings, he abandoned studies to which he was little inclined, and devoted his attention to watching them, and he was ultimately permitted to assist them. Studying earnestly and practising diligently, he soon became

noted as one of the best painters of the day, and executed many works for religious persons and communities. His fame having spread abroad, he was invited to adorn the church of St. Francis at Assisi. He painted part of the walls in concert with certain Greek painters; but having far surpassed his assistants, his courage and ambition increased, and he went on with the work alone. He was recalled to Florence by private affairs, and obliged to leave his work uncompleted. It was afterwards finished by Giotto. After his return to Florence, among other pictures he painted a Madonna for the church of Santa Maria Novella, which was of a size so unusual at that time, and was considered so novel and splendid, that it was carried to the church in procession; and according to the tradition, when Charles of Anjou visited the church, multitudes who had not yet obtained a sight of the picture accompanied him with such rejoicing and festivity, that the street was afterwards called Borgo Allegri, literally 'Merry Borough.' Cimabue was engaged as an architect, in conjunction with Arnolfo Lapi, to build the church of Santa Maria del Fiore; but he died shortly after, in the year 1300.

Previously to the time of Cimabue, painting had sunk to a merely mechanical occupation, and was chiefly in the hands of Greeks, who worked after certain fixed patterns, each blindly copying his predecessor. Cimabue's right to be considered as the restorer of the art has been warmly urged, and as warmly contested. It appears probable that a re-action had taken place, and that contemporary or even preceding artists had shown an inclination to abandon the mechanical dryness of the modern Greek artificers, when Cimabue took up the profession. The ardour of his disposition however, and perhaps his rank in society, induced him to venture upon the most notable deviations from the cramped style of the period; and the revival of the art would probably have been delayed some time longer, had it not been for the impulse which it received through him. While adhering to the traditional types in his religious subjects, he put some life into the heads and into the action of his figures, abandoning the cold straight lines of his Greek instructors. He is supposed to have been the first to recur, after a long interval, to the study of nature, and to have drawn from the living model, though but sparingly. Nor is it the least debt which painting owes to Cimabue, that he discovered and fostered the genius of Giotto.

Cimabue worked in fresco and distemper, oil painting being a later discovery. Some of his works still exist; the principal are in the church of Santa Maria Novella at Florence, and that of St. Francis at Assisi.

(Vasari; Baldinucci; Lanzi.)

CIMAROSA, DOMENICO, one of the most celebrated composers of the Italian theatre, was born at Naples in 1754. To Aprile he was indebted for his first instructions in music, but he completed his studies under Durante at the Conservatorio of Loretto. His general education was also of a superior kind, and he was not only esteemed for his professional ability, but for his well-informed mind and amiable temper. The first work that made him known was 'L'Italiana in Londra,' performed in 1779. But it is 'Il Matrimonio Segreto' which will transmit his name to posterity; for of his thirty operas, most of which were in their day the admiration of all amateurs, the last-mentioned is the only one now ever performed. When this was brought out at Vienna it so delighted the Emperor Joseph II., that at its conclusion he invited the singers and band to a supper, then sent them back to the theatre, and the whole piece was repeated; the only instance on record of the encore of an entire opera. In 1787 Cimarosa was invited by the Empress Catharine to St. Petersburg, where he produced three operas. He returned to Naples, and having shown no little partiality for the French during their occupation of that city, very narrowly escaped the sanguinary proscription which disgraced the restoration of the old royal family. He died at Venice in 1801.

Cimarosa excelled most in comic opera, but his 'Orazi e Curiazi' proves that he could compose well in a different style. He is the link which unites the old and modern schools, his scores exhibiting an instrumentation much stronger than that of Paisiello, though inferior in vigour and richness to that of Mozart.

CIMON (Κίμων), the name of two Athenians, one the father (Herod. vi. 34) and the other the son of Miltiades. The memory of the elder Cimon rests almost entirely on the fame of his son; scarcely anything is known of him except that he was remarkably stupid. Cimon, the son of Miltiades and Hegesipyle, was born about B.C. 502. Miltiades died in prison, and Cimon had to pay the fine which had been imposed on his father. Without the aid of the opulent Callias, who is said to have assisted him, fifty talents would probably have made a large and inconvenient inroad on his patrimony (Herod. vi. 136.) The anecdotes which remain of Cimon's early youth are not creditable either to his morals or to his intellect. The worst excesses are laid to his charge. Although little confidence can be given to the details of these numerous reports, so much seems to be clear, that he did not do as others of his rank did, or as it was expected that the son of Miltiades would do. He even neglected what in Athens were usually deemed the essential branches of a liberal education. On the other hand, the stupidity which is ascribed to him at this period, and the reputation for which fixed on him his grandfather's nickname Coalemus (ὁ κολέμος, 'the idiot'), was probably nothing more than a natural

reserve, combined with a certain inaptitude to social vivacity or oratorical display, which however may not have at all disqualified him for the services of active life. He seems to have excelled rather in doing, than in talking about doing. Aristides almost alone discerned in him the elements of a great character; and it is probably to his fostering charge and counsels that the glorious results which were afterwards developed are partly due.

Cimon's entrance into public life may be placed at the conquest of Eion, on the Strymon, B.C. 476. This town, which was very important to the Persians, was desperately defended by the garrison under the command of Pagas, who at last, rather than surrender, raised a huge pile, placed on it his wife and children, and servants, and all his treasures, and after throwing his gold and silver into the Strymon, cast himself into the flames. (Herod. vii. 107; Thucyd. i. 98.) Cimon's next victory was at the island of Scyros, which he seized under the pretence that it had been guilty of piracy which called for punishment. He planted a colony of Athenians, and divided the land amongst them. (Thucyd. i. 98.) But Cimon's most important victory was at the Eurymedon in Pamphylia, B.C. 466, where he sunk or took 200 Persian ships, and carried away prodigious booty from their tents on the banks of the river. A squadron of Phœnician ships which was coming to the aid of the Persians was met by Cimon, and wholly destroyed. The Persians were still in possession of the coast of Thrace. That Cimon should feel peculiar interest in wresting these possessions from their power is easy to be explained. Olorus, the father of Hegempyle, had been king of Thrace. (Herod. vi. 39.) Accordingly he sailed with a small force and dislodged them from his patrimony, and from a large extent of adjoining country. Twice he led a force to assist the Lacedæmonians, B.C. 464 and 461, at the siege of Ithome. The insulting manner in which the services of the Athenians were rejected by the Lacedæmonians (Thucyd. i. 101-2) on the latter occasion, seems to have put the people in ill humour with all the friends of Sparta; and this may have had some effect in bringing about Cimon's exile. Towards the end of the same year (B.C. 461) in which they returned from Ithome, Cimon was banished for ten years by ostracism. (Clinton, 'Fast. Hel.' vol. i. p. 48.) In the year B.C. 457 there was a battle between the Lacedæmonians and Athenians, at Tanagra in Boeotia. Cimon presented himself to fight on the side of the Athenians, and took his stand among those of his own tribe. The council of 500 were consulted, and he was not allowed to remain: he left the army beseeching his friends to act like brave men, and to prove their attachment to their country by their deeds. The Athenians however were signally worsted; and this, with other defeats which they suffered during the exile of Cimon, seems to have led them to wish for his return. In the fifth year of his banishment he was recalled by a decree, of which Pericles himself was the mover. A five years' truce between the Athenians and Lacedæmonians was concluded through the intervention of Cimon B.C. 450. In the following year, B.C. 449, he was appointed to the command of a fleet of 200 vessels, which sailed to assist the Egyptian king Amyrtæus. He sent on a squadron of sixty galleys to the aid of Amyrtæus, and with the rest besieged Citium in Cyprus. Here he died, either from illness or from a wound. Just before he died he forbade his men to report his death until they arrived at Athens; and Plutarch preserves the remark of Phanodemus, that the army was as it were conducted by Cimon thirty days after he was dead. Though the Athenians were forced by want of provisions to raise the siege of Citium, they did not return home without a victory: they met with a fleet of Phœnician and Cilician ships near Salamis in Cyprus, and completely defeated them. They afterwards defeated a force on shore.

The slender private fortune to which Cimon succeeded had been considerably augmented by his Persian victories, and especially by the recovery of his patrimonial estates in Thrace. He did not use his acquisitions for personal aggrandisement: his munificence was not only fully equal to his means, but was in many respects judiciously dispensed: he preferred hospitality to luxury, and would rather provide a frugal entertainment for many, than a sumptuous banquet for a few. Many of the splendid improvements which he made in Athens were effected at his own cost. The walls from the city to the harbours of Piræus and Phalerum were commenced, and in great part executed at Cimon's expense. He changed the Academy from a barren uncultivated field to a shady and pleasant grove, and planted the Agora with plane-trees. It is probable that his taste in these public decorations was improved by his acquaintance with the painter Polygnotus.

The great object of the policy of Cimon was unceasing war with the Persians, and, in order to prosecute this the more effectually, he strove to maintain the unity of the Greeks. Himself of noble birth, he naturally belonged to the aristocratical party, and was anxious to preserve the old institutions of his country, which time and usage had rendered sacred. He desired to see Sparta independent, an ally, or even a rival, rather than a subject of Athens; and this circumstance exposed him to many odious charges, which, however groundless and often refuted, probably exerted an influence on the estimation in which he was held. While Cimon was engaged in continual expeditions, and was nearly five years in exile, a line of politics, altogether different from his, came into vogue under the auspices of Pericles

[PERICLES], who must be considered as Cimon's successor on the political stage.

(Plutarch; Nepos, *Life of Cimon*; Thirlwall, *Greece*, vol. iii, pp. 1-36; Heeren, *Political History of Greece*, p. 223, Engl. transl.)

CINCINNATUS, a celebrated Roman consul. Little is known of him previous to the difficulties of his son Cæso, who, for opposing the tribunes in the performance of their functions, and for ill-treating an old ex-tribune, was to be tried by the Iulian law. Sureties however were bound for his appearance. In the meantime he went into voluntary exile, and, according to Livy, the sum in which the sureties were bound was exacted from Cincinnatus. In order to pay it, he was obliged to sell nearly all his estates, and afterwards retire to a small farm on the banks of the Tiber, where he cultivated the ground with his own hands. Being subsequently chosen consul, the messengers sent to acquaint him with his election found him engaged in the labours of agriculture. It is said that Cincinnatus, on hearing the news which they brought, was less elated by the honour his country had paid him, than grieved for the prospects of his farm during his absence. In the year of his consulship he succeeded in restoring tranquillity to the city, and establishing a partial agreement with the tribunes: the senate wished to continue him in office, but he insisted on resigning it at the close of the year, when he retired to his farm and rural occupations. Soon afterwards (A.U.C. 297) he was chosen dictator, and again received the announcement of his new honour while employed in the cultivation of his field. Conducted into Rome amidst the acclamation of the people, he forthwith marched against the Æqui, and gained a signal victory, after which he entered the city in triumph. He procured the recall of his son Cæso from exile, and then abdicated the dictatorship on the sixteenth day after he had received it. He afterwards headed an army against the Volsci, and added another to his former victories. In the absence of military tribunes, he was subsequently created interrex for a short time. A second time he was chosen dictator. Cincinnatus was now more than eighty years of age, and nothing but the solicitations of the consuls and senate induced him to accept the office. In all the posts which he filled at different times, his virtue and probity, as well as his patriotism and military success, gained him general admiration. Niebuhr (vol. ii. p. 289) rejects the story of Cincinnatus paying the fine of Cæso, as a mere fiction, fabricated to account for the humble circumstances of so great a man. (Dionysius Halicarnassensis, x.; Livius, iii. 26, 30, 31, &c.; Cicero, *De Fin.* ii. 4; Niebuhr, *Rome*, vol. ii. p. 286, &c., Engl. transl.)

CINCIUS. L. CINCIUS ALIMENTUS, and his contemporary Fabius Pictor, are mentioned by Dionysius of Halicarnassus ('Roman Antiq.' i., c. 6, ed. Hudson), as the oldest of the Roman annalists. Alimentus is also frequently mentioned by Livy (xxi. 38, xxvi. 23, &c.)

The time of the birth and death of Cincius is not known, but he was actively engaged during the occupation of Italy by Hannibal. Alimentus was of a plebeian family. He was quaestor B.C. 219, tribunus plebis B.C. 214, and plebeian ædile B.C. 212. After Marcellus had taken Syracuse, and left Sicily, Cincius held that province for two years as prætor (Livy, xxvi. 28, xxvii. 7), in the years B.C. 210 and 209. He took with him the soldiers who had survived the defeat at Cannæ. In the next year he had the command of a naval force, with which he crossed over from Sicily to Locri, on which he made an unsuccessful attack, and was obliged to retreat. He was afterwards one of three commissioners who were sent by the Senate to give their advice to T. Quinctius Crispinus, the consul, who was lying wounded at Capua. It is not known whether it was at this time or later that he fell into Hannibal's hands, a circumstance which gave him the opportunity of acquiring a more exact knowledge of the events of that period. He learned some facts from the mouth of Hannibal himself (Livy, xxi. 38). Cincius wrote a history of Rome from the foundation of the city to his own time, of which Dionysius says that he treated minutely of the events with which he was personally acquainted, but in a summary way of the events which followed the foundation of the city. Neither the title of his work nor the number of books is known. The work of Cincius is stated by Dionysius to have been written in Greek, and there is no evidence to oppose to this. Livy frequently mentions Alimentus, and in one passage (vii. 3) he calls him an exact authority.

Other works were attributed to Cincius—on Gorgias of Leontini, on the Fasti, the Comitæ, on the authority of the consuls, on the office of a Jurisconsult, on Military Matters, on Ancient Words, and De Festis Mystagogicis. But it is not certain that the Cincius who was the author of these works was the same as the historian, though it is likely enough that an historian might write on military tactics. Gellius (xvi. 4) gives several extracts from the work on military matters, but he simply calls the author Cincius. The chronological difficulty which Krause raises against the author of the treatise on military matters being also the historian is not very great. His arguments against the probability of Cincius having written a grammatical work such as that on ancient words are much stronger; and indeed there is no sufficient evidence that the other works that have been mentioned as written by Cincius, were written by the historian.

The epoch which Cincius assigned to the foundation of Rome is about the fourth year of the twelfth Olympiad, or B.C. 728. The discrepancy from other reckonings is accounted for by supposing that Cincius either followed other evidence than the annals of the Roman

pontifices; or that he made his calculation by changing the lunar years of the early Roman kings, which were of ten months, into years of twelve months, according to the reckoning of the period when he wrote. Now if we admit, as Junius Gracchanus states, that the old calendar was in use to the time of the first Tarquin, which will give a period of 192 years from the foundation of the city, we may adopt the following solution of Niebuhr:—"If Cincius took these to be cyclical years, he got exactly a secul (110 years) for the first four kings; and if he subtracted the difference, twenty-two years, from the era of Polybius, the result for the building of the city would be the very date, Ol. 12, 4." (Niebuhr, 'Roman History,' Transl. i. 280).

(The fragments of Cincius are printed in Krause's *Vite et Fragmenta Veterum Historicorum Romanorum*, Berlin, 1833.)

CINNA, LUCIUS CORNELIUS, a Roman patrician, who belonged to the party of Marius. In B.C. 86 he obtained the consulship with Octavius, who made a strenuous opposition to his proposal for recalling Marius and his party from banishment. A dispute followed between the consuls, which was attended with bloodshed. Cinna, unable to make head against his opponents in Rome, withdrew to Tibur, Praeneste, and other neighbouring towns, to seek for aid. By thus leaving his post he resigned his office, and the senate took an early opportunity to appoint another consul, L. C. Merula, in his room. Cinna, now in concert with Marius, Carbo, and Sertorius, advanced to Rome, and laying siege to the city, the senate were forced to propose a treaty, which was at last concluded. Cinna was reinstated in the consulship, and Marius was readmitted as a Roman citizen. Marius however refused to enter the city until the sentence of banishment was formally repealed. Accordingly an assembly of the people was held; but while the votes were taking, Marius entered Rome with armed men, and forthwith proceeded to take vengeance on his opponents. Sulla's house was destroyed, and every quarter of the city was the scene of robbery and murder. Octavius, the colleague of Cinna, with many senators, fell in the massacre. The partisans of Marius were as reckless as their leader. At last Cinna and Marius themselves became desirous of putting an end to these revolting proceedings, and among other measures they seized on the consulship together. Marius died at the age of seventy years, on the first day of his entering on the office. Cinna continued the usurpation which he had begun, and chose for his colleague Valerius Flaccus, to whom he assigned the province of Asia.

When Sulla had brought the Mithridatic war to a close, he contemplated returning to Italy, in order to punish his enemies. Previously however to setting sail, he sent the senate a statement of the services he had rendered and the wrongs he had suffered, at the same time threatening his enemies with his vengeance. The senate endeavoured to appease Sulla. They also attempted to moderate the fury of Cinna, but he persisted in prosecuting the war. He made himself consul, B.C. 83, with Papirius Carbo [CARBO], to whom he gave the command in Gaul. Cinna now prepared to oppose Sulla, and intended to meet him in Thessaly, by which route it was supposed he would return to Italy. The troops however were reluctant to embark, and an attempt to force them ended in a mutiny, in which Cinna was killed. C. Julius Caesar married Cinna's daughter Cornelia.

(Appian, *de Bell. Civ.*, i. 389-97; Livius, *Epit.* lxxix., lxxx., lxxxiii.; Florus, iii., 21; Velleius Paterculus, ii., 19-24; Dion Cassius in *Fragm.*; Plutarch, *Lives of Marius and Sulla*.)

CORNELIUS CINNA, a grandson of Pompey, headed a conspiracy against Augustus, who however generously pardoned him and made him consul. Their friendship remained afterwards unbroken.

CIONE, ANDREA DI [ORCAGNA.]

CIPRIANI, GIOVANNI BATISTA, descended from an ancient family of Pistoia, was born at Florence in 1727. He received his first instructions from Heckford, an English artist. He afterwards studied under Gabbiani; or, according to Lanzi, he studied from a collection of drawings by Gabbiani, upon which he formed his style. In 1755 he came to England, and subsequently married an English lady of moderate fortune, by whom he had three children. He was one of the original members of the Royal Academy, and was presented with a silver cup by that body in return for the design for their diploma, which he furnished. He died, much esteemed, December 14, 1785, and was buried at Chelsea. Cipriani executed few paintings. Lanzi mentions two, in the Abbey of St. Michael on the Sea. He employed himself chiefly in drawing designs, of which Bartolozzi engraved a great number. His designs exhibit skill in drawing, and a kind of meretricious grace, but they belong to an essentially corrupt school, and the influence of Cipriani upon English art was as far as it extended certainly mischievous.

CISNEROS, FRANCIS XIMENEZ DE (by the Spaniards generally called Cardinal Cisneros; but in biographical and other works he goes under the name of Ximenez), a celebrated statesman and patron of literature, a cardinal and primate of Spain, was born in 1437 at Torrelaguna in New Castile. He studied at a school at Alcalá de Henares and at the university of Salamanca, and afterwards went to Rome, where he acquired such reputation, that Sixtus IV. promised him the first vacant prebend in the cathedral of Toledo; but the Archbishop of Toledo, vexed at this inroad on his patronage, and at the firmness with which Cisneros demanded it as his right, threw him into a dungeon. Being released at the end of six years, Cisneros went to

Sigüenza, where Cardinal Mendoza appointed him his grand vicar. In 1482, abandoning his brilliant prospects, he embraced the Franciscan rule. In 1492 Queen Isabella took him for her confessor, and in 1495 nominated him Archbishop of Toledo. This honour he declined with a firmness which nothing but the commands of the pope could overcome. In this exalted station he retained all his monastic severity. He constantly wore under the pontifical robes the coarse frock of St. Francis. In his travels he always endeavoured to lodge at some convent of his order, and he conformed to all the rules like an ordinary member. He set apart half of his enormous revenue (at that time amounting to 200,000 ducats) for the relief of the necessitous; and he made a daily distribution of provisions to thirty poor. He also expended considerable sums in the ransom of captives.

In 1498 Cisneros founded the University of Alcalá de Henares, in which he provided for poor students, appointed a fund for prizes, and invited distinguished men from Paris, Bologna, Salamanca, and Valladolid. He instituted also a seminary for young ladies of respectable families who were destitute of fortune. Adjoining it he established a nunnery for those among them who chose to retire from the world: to the rest he allotted portions, and disposed of them in marriage suitably to their condition.

In 1502 he undertook, assisted by eminent scholars, his Complutensian Polyglot, the type and the model of all subsequent ones. He sent to every quarter for manuscripts, and Leo X. obliged him with a communication of what he possessed. He collected seven copies in Hebrew at the expense of 4000 ducats, besides procuring from Rome a Greek manuscript, and from other quarters many Latin manuscripts: not a single manuscript of this collection was of less antiquity than 800 years. The whole charge of the undertaking, which was completed in fifteen years, amounted to the immense sum of 50,000 ducats.

On the death of Queen Isabella in 1504, as all parties strove to attach Cisneros to their interest, he became the arbitrator between King Ferdinand and the Archduke Philip, the husband of Joanna, heiress of the crown. On the death of Philip, two years after, Cisneros was appointed regent on account of the incapacity of Joanna and the absence of Ferdinand. This was a critical moment for him, but his prudence overcame all difficulties, and kept all parties in check. He levied troops at the public expense, totally independent of the grandees, from whose hands he succeeded at last in rescuing the crown. He thus began, perhaps unconsciously, to vindicate the rights of the people against the nobility in Europe. By the feudal system, the military power was lodged in the hands of the nobles, and men of inferior condition were called into the field as their vassals. A king with scanty revenues therefore depended on them in all his operations. In 1507 Julius II. gave Cisneros the cardinal's hat. In 1508 the septuagenarian cardinal set off from Malaga at the head of 10,000 foot and 4000 horse for the conquest of Oran, on the coast of Africa, which he added to the Spanish dominions at his own expense.

When Leo X., in order to raise money to complete the church of St. Peter, proposed to sell dispensations, Cisneros opposed the introduction of the pope's bulls into his diocese. On another occasion, as a primate of Spain, he prevailed on the king to exclude all bulls but what had received the sanction of the royal council; and ever since that time this salutary advice has been acted upon in Spain. At another time he opposed a claim of the same pope to the tenth of ecclesiastical benefices, and obliged him to be content with a tax of a tenth upon the clergy of the States of the Church.

Ferdinand at his death, 23rd of January 1516, left Cardinal Cisneros regent till the arrival of his grandson, Charles I. of Spain, afterwards Charles V. of Germany. The Dean of Louvain (afterwards Pope Adrian VI.), opposed this nomination. Cisneros however consented to admit him into the administration, and chose Madrid for his residence, that he might be more independent of the nobility, and better able to control their factions. The grandees objected to the power of Ferdinand to confer the regency, himself being only a regent, as the widower of Isabella; and the letter of Charles, which Cisneros showed them in ratification of Ferdinand's will, they treated as a mere matter of form. To satisfy their objections at once, the cardinal coolly requested them to wait upon him. From a balcony he showed them 2000 men in array, with a formidable train of artillery, which he ordered to be discharged. "There," said he, raising his voice, "are the powers which I have received from his Majesty, and in a word *hæc est ultima ratio regum*."

John Albrecht, the dispossessed king of Navarre, supported by some of the grandees, was forming a scheme to recover his kingdom. Cisneros, who had foreseen the danger long before, ordered a powerful body of troops to enter Navarre, and completely frustrated the attempt. To secure Navarre, he caused its numerous and expensive fortresses to be demolished, except Pampeluna, which he strengthened. To this precaution Spain was not only then but often since indebted for the preservation of Navarre. In order to pay the debts of Ferdinand and the officers of his new militia, and to establish numerous and well-furnished magazines, Cisneros boldly undertook the abolition of unnecessary pensions, and enforced the restitution of many extensive crown demesnes, which had been alienated chiefly to the nobility in the late reign. He did not spare his dearest friends, nor even men of learning. The historian Peter Martyr of Anghiera and

Gonzalez Oviedo suffered with the rest, and in revenge have defamed the cardinal's character.

While Charles remained in Flanders, every pretender to favour resented thither, but nothing could be obtained without pecuniary application to his favourite Chievres. Great sums were drawn out of Spain, and everything was disposed of to the highest bidder. The inferior officers followed the example of their head, and this infamous traffic became general. On the other hand, seeing Flanders on the eve of becoming a distant province of a vast monarchy, the Flemish ministers detained the king as long as they could, spreading all the time delusive reports of his instant departure, and cheating the cardinal under the pretext of defraying the expense of the king's voyage. When after twenty months of entreaties Cisneros prevailed on Charles to embark for Spain, and was himself proceeding towards the coast to meet him, he was seized with a violent disorder, at the convent of Boecullina, near Aranda de Duero, which was attributed to poison. The Spanish grandees and Flemish courtiers now regulated the advance of the court by the probable extent of the cardinal's life. Weakened by disease, fatigue, and austerities, he still directed, to the great vexation of the courtiers, the helm of state, and seemed to survive only to evince his greatness of spirit unimpaired by bodily suffering. Under pretext of giving time to the towns for preparing the honours due to the king, they succeeded in deferring his entry into Castile till the cardinal's death, which happened on the 8th of November 1517, but not before Charles, whose pride was worked upon by his flatterers, had written, with signal ingratitude, a letter to Cisneros signifying to him his dismissal. The rare union of calmness, firmness, and decision in Cisneros, is well shown in Gometius (Gomez de Castro), 'De Rebus gestis à Francisco Ximenio;' in Marsollier, Fléclier, Moreri, and Robertson.

CLAIRAUT, ALEXIS CLAUDE, sometimes spelt CLAIRAULT (we have taken the spelling from the title of his own works), was born at Paris, May 7, 1713. His father, John Baptist Clairaut, was a teacher of mathematics. The early proficiency of the son in mathematics is better attested than in any other similar case, by the actual appearance of his celebrated treatise on 'Curves of Double Curvature,' in 1731, when he was eighteen years of age, accompanied by the usual official recommendations, which prove that it was ready for the press two years before; it is said to have been begun when he was only thirteen years old. He read the 'Conic Sections' of De L'Hôpital, and also the 'Infinitesimals Petites' of the same author, when he was only ten years old; a fact which we should have forborne to state, had it not been for the evidence contained in the treatise just cited, and in this fact, of public notoriety, that at the age of twelve years he presented a memoir on some remarkable curves to the Academy of Sciences, and removed all doubts as to its authorship by his personal explanations.

In 1731, being then under the legal age, Clairaut was admitted into the Academy of Sciences. He formed an intimate acquaintance with Maupertuis, and commenced at this period his researches on the figure of the earth. In 1735 he accompanied Maupertuis, Camus, Lemonnier, &c. in their expedition to Lapland, for the purpose of measuring a degree of the meridian. This measure has frequently been considered as of little value: it must however be remarked, that such an opinion has been formed on the strength of discrepancies which were sufficiently apparent to the measurers themselves, and which caused them to review all their operations; as also, that circumstances connected with local attractions are fully sufficient to explain the whole difficulty. The work of Clairaut on the 'Figure of the Earth' appeared in 1743, and was reprinted in 1808. It contains the remarkable discovery which is usually called Clairaut's Theorem. Considering the earth as an elliptic spheroid, it should seem that the variation of gravity on the surface would depend upon the law of density of the interior strata. But Clairaut showed that this variation is altogether independent of the law of density, and may be deduced from a knowledge of the form of the exterior surface. In this theorem, the second and higher powers of the eccentricity are rejected. Mr. Airy (in an early volume of the 'Cambridge Transactions') has shown that it remains true when the higher powers are taken into account.

In 1759 Clairaut gained the prize of the Petersburg Academy for his paper on the 'Theory of the Moon.' It is more essential for us here to state the position which he occupies among the successors of Newton, than to enter into details which are better suited to other articles. Newton had left one prominent point of the lunar theory altogether unexplained by his theory of gravitation, namely, the motion of the lunar apogee, of which, though able to assign a sufficient reason for the phenomenon of progression, he was not able to deduce more than half the quantity of the phenomenon. Clairaut at first concluded that the law of gravitation was incompletely expressed; but further consideration, and more extensive application of analysis, showed that the whole motion was a necessary consequence of the Newtonian supposition of mutual attraction. In two points of view, therefore, as the first who applied what is now called the modern analysis to the problem of the lunar motion, and as the first who added an unexplained phenomenon to the theory which Newton had left, Clairaut stands in a conspicuous position.

Clairaut was the first who applied the Newtonian theory to the motion of comets, in reference to the perturbation of their motions

by the attraction of the planets. In 1757 astronomers began to expect the fulfilment of Halley's prediction relative to the comet (whose appearance in 1835 again excited much public curiosity). Lalande proposed to Clairaut to undertake the actual computation of the quantity of Jupiter's action on the comet during a revolution, and offered his assistance in the drudgery of the work. For the manner in which this enormous labour was executed the reader may consult the article 'Halley's Comet,' in the 'Companion to the Almanac for 1835.' The result was that Clairaut's prediction came very near the truth; the return of the comet was at first placed in November 1758; in that month Clairaut predicted that it would arrive at its nearest point to the sun about April 13, 1759, stating that he might possibly be wrong by a month. The observed perihelion of the comet was on the 13th of March. The error would have been considerably less if the existence of Uranus, and a more correct value of the mass of Saturn, had been known.

The figure of the earth, the theory of the moon, and Halley's comet, are the three prominent points on which the fame of Clairaut rests. We might mention his work on 'Geometry,' drawn up, it is said, for the use of Madame du Chastellet; his 'Elements of Algebra,' remarkable at the time for the abandonment of the dogmatical form in which it was customary to write elementary works; and many papers in the 'Memoirs of the Academy,' containing several remarkable discoveries in pure mathematics. But we shall pass on to some notice of his career in connection with that of D'Alembert. These two great men were rivals in their scientific labours, and though their disputes never passed the bounds of courtesy, the life of each, with respect to the other, was either armed truce or open war. The characters of the two were essentially opposite: Clairaut was a man of the world, of high polish, and who took great care never to offend the self-love of any one; D'Alembert was blunt and rude, though essentially well-meaning and kind; if we may use such a colloquial phrase, he 'stood no nonsense;' 'j'aimie mieux être incivil qu'ennuyé' was his avowed maxim. Clairaut was always in the world, desirous to shine, and to unite the man of fashion with the philosopher, of all which D'Alembert was the reverse. The attacks usually came from the latter, confined entirely to the writings of his opponent; and he was frequently right, being a thinker of a more safe and cautious order than Clairaut, who was more than once too hasty. For instance, when Clairaut took the whole revolution of Halley's comet, or more than fifty years, as the unit of which the error committed by him should be considered as a fraction, D'Alembert asserted that the magnitude of the latter should be compared, in the estimation of precision, with the difference between two successive revolutions, or about a year and a half. Later analysts, and Laplace in particular, have considered that D'Alembert was right. The preceding comparison is drawn from Bossut ('Hist. des Math.'), who was the personal friend and the decided eulogist of both. He adds that the polished character of Clairaut procured him an *existence* and a consideration in the great world which talent alone would not have sufficed to gain; and more than insinuates that dissipation destroyed his constitution. However this may be, Clairaut died at Paris, May 17, 1765, at the age of 52. He was never married: his father (who survived him a short time) had a very numerous family, of whom only one daughter survived.

(See the *Eloge* in the *Memoirs of the Academy*; the *Life* by Lacroix in the *Biog. Univ.*; and the work of Bossut above cited.)

The works of Clairaut, independently of Memoirs presented to the Academy, are:—1. 'Recherches sur les Courbes à double Courbure,' Paris, 1731. 2. 'Éléments de Géométrie,' Paris, 1741; and various editions up to 1765. 3. 'La Figure de la Terre déterminée,' &c. ('Account of the Lapland Measure, by Maupertuis, Clairaut,' &c.); Paris, 1738; in Latin, by Zeller; Leipzig, 1742. 4. 'La Théorie de la Figure de la Terre,' Paris, 1743; again in 1808. 5. 'Éléments d'Algèbre,' Paris, 1746; again in 1760 ('très estimée,' Lacroix); again in 1797 and 1801 (marked sixth edition), by Garnier, with a Preliminary Treatise on Arithmetic. 6. 'Théorie de la Lune,' St. Petersburg, 1752; (prize essay) second edition, 1765. 7. 'Tables de la Lune,' &c., Paris, 1754; republished with (6) in 1765. 8. 'Théorie du Mouvement des Comètes,' Paris, 1760; the account of the great process relative to Halley's comet. D'Alembert wrote against this in the 'Journ. Encycl.,' February 1761; Clairaut replied in the 'Journ. des Sav.,' June 1761. 9. 'Recherches sur la Comète,' &c., St. Petersburg, 1762 (Supplement to 8). 10. 'Explication des Principaux Phénomènes,' &c., compiled by Madame du Chastellet from Clairaut's instructions, and printed at the end of her translation of Newton, Paris, 1759. [CHASTELLET, MADAME DU.]

CLAIRON, CLAIRE JOSEPHE LEYRIS DE LA TUDE, a celebrated French actress, whose name frequently occurs in the literary memoirs and correspondence of her day, was born near Condé, in French Flanders, in 1723. She made her early appearances in the Flemish theatres and those of the neighbouring provinces of France. In 1732 she was called to the Parisian Opera, and soon afterwards to the Comédie Française. Although her name is now seldom mentioned, no actress of any age or country appears to have been the object of a reputation so wide and an admiration so intense. No one can read the letters of Voltaire and his contemporaries, or the memoirs of Marmontel and others, without being struck by the frequent recurrence of her name, associated with enthusiastic eulogies. She was evidently a woman of vicious morals, yet she was proud and unbending

in public; and Voltaire, who had obvious motives for esteeming her from her successful representation of several of his characters, speaks of her in his 'Candide' as a person moving in so high and select a circle, that the boast of having met her in society is put into the mouth of an obscure braggart addicted to telling extravagant fictions. The prevailing character of her acting was the natural, and in this she was distinguished from her rival Dumesnil, who was considered the representative of art. Mademoiselle Clairon quitted the Comédie-Française in 1766. She lived for many years as mistress of the Margrave of Anspach, and died in 1803. Some memoirs relating to her were printed in 1799 by her pupil Mdle. Raucourt, and there are many anecdotes of her in the memoirs of the Margravine of Anspach and the 'Mémoires de Fleury' (the actor).

CLAPPERTON, HUGH, was born in 1788, at Annan, in Dumfriesshire, N.B., where his father was settled as a surgeon and country practitioner. After receiving the rudiments of a plain education, with some instruction in mathematics, he went to sea at the age of thirteen, being bound apprentice in a merchant-ship that sailed between Liverpool and America. After making several voyages he was impressed and sent on board a man-of-war as a common seaman. Fortunately Clapperton had an uncle, a captain of marines, through whose interest with the naval commanders then in commission in the Mediterranean, he was put on the quarter-deck and made a midshipman. In this capacity he gave proofs both of fortitude and courage. In 1814 he went to Upper Canada, and some time after his arrival he was promoted to the rank of lieutenant, and appointed to the command of a schooner belonging to the British flotilla on the lakes. In 1817, this flotilla having been dismantled, Lieutenant Clapperton returned home on half-pay. He amused himself in his native district with shooting and fishing, until 1820, when he removed to Edinburgh and became acquainted with Dr. Oudney, whose mind was absorbed by the subject of African discovery. In 1823 he was employed by Lord Bathurst, in conjunction with Dr. Oudney and Major Denham, to make a journey to Timbuctoo, in central Africa. The doctor died at an early stage of the journey in January 1824. Proceeding south from Tripoli, on the Mediterranean, by Musafia, and by Zangalia, on the east of the great Lake Tchad, Clapperton, after great sufferings, reached Saccatoo, where he was obliged to turn back. He and Denham determined the positions of the kingdoms of Mandara, Bournou, and Houssa, and of their chief towns, but they were not able to ascertain the course and termination of the Niger—the main object of the expedition. Their description of Lake Tchad, with the huge hippopotami in it, and the elephants and other wild animals on its shores, is exceedingly interesting. On the 22nd of June 1825, soon after his return to England, Clapperton was raised to the rank of commander, and engaged almost immediately to start afresh on the same perilous journey. His companions were Captain Pearce, R.N., Mr. Dickson, and Dr. Morrison, a navy surgeon and naturalist; the party was attended by Richard Lander, Dawson, and two or three other servants. This time Clapperton penetrated into Africa from the coast of the Atlantic. The party landed in the Bight of Benin on the 28th of November 1825, and proceeded inland from Badagry, December 7; but they had scarcely moved from the shore when they were attacked by the usual maladies of the country. Dawson died at Tshow, not far from Badagry, and Captain Pearce soon after, at Engwa. Dr. Morrison, who had returned towards the coast, expired at Jannah. The survivors, meeting with great kindness and hospitality from the natives, reached Katunga, the capital of Yariba, on the 15th of January 1826. They proceeded to the great commercial city of Kano, and thence, bearing to the west, went to Saccatoo, which Clapperton had reached from the side of the Mediterranean on his former journey. Here Bello, the king or chief of the country, detained his old acquaintance on account of wars carrying on, and (it is said) at the jealous suggestions of the Dey of Tripoli, who represented the English as aiming at the possession of all Africa. Clapperton's vigorous constitution gave way under the effects of the climate and privation, and he died of dysentery on the 13th of April 1827, at Chungary, a village four miles from Saccatoo.

(*Narrative of Travels and Discoveries in Northern and Central Africa in the years 1822, 1823, 1824*, by Major Denham, Commander Clapperton, and the late Dr. Oudney, 4to., Lond., 1826.—*Journal of a Second Expedition into the Interior of Africa, &c.*, by the late Commander Clapperton. 4to., Lond., 1829. To this volume a Memoir of his life is prefixed.—*Records of Captain Clapperton's Last Expedition to Africa*, by Richard Lander, the only surviving member of the Expedition. 2 vols., small 8vo., Lond., 1830.)

*CLARE, JOHN, was born at Helpstone, near Peterborough, Northamptonshire, July 18, 1793. His parents were extremely poor, his father, a farm labourer, only being able with great difficulty to provide food for his family, and in his latter years constrained from illness to eke out a subsistence by a weekly allowance from the parish. As soon as possible the boy was sent to work in the fields, and by extra work as a plough-boy and by helping his father morning and evening at threshing, he earned enough to pay for occasional education at the school of a neighbouring parish. He thus in the course of three years learned sufficient at odd times to be able to read the Bible with ease, and from the little prizes he won by such extra tasks as the repetition by heart of a chapter in Job and the like, he was

enabled to purchase a few books. A good-natured neighbour kindly assisted him in mastering writing and arithmetic. As early as his thirteenth year the boy had begun to write verses, and when he grew to manhood, notwithstanding the hard toil and poverty of a peasant's life—his highest wages, and that during only part of the year, were but nine shillings a week—he continued to write them, though they attracted no notice beyond that of his companions, till about the end of 1816, when a 'Sonnet to the Setting Sun,' signed J. C., written on a loose piece of paper, fell into the hands of Mr. Drury, bookseller of Stamford, who, struck by its simplicity and freshness of character, enquired after the author, and having visited him at Helpstone, was shown other poems, with which he was equally pleased. The result was the publication in 1820 of a small volume of 'Poems descriptive of Rural Life and Scenery,' by John Clare, a Northamptonshire Peasant, to which was prefixed a brief account of the author by Mr. Octavius Gilchrist. The volume attracted much attention; the verses were felt to be the genuine utterance of a simple-hearted peasant's love of nature and natural scenery, and efforts were at once made to place him in a position less hostile to the exercise of his native genius. A sufficient sum was raised to place him in a house free of rent, and a small income (but one larger than he had any prospect of being able to acquire by field labour) was partly secured to him. His future thus, as it seemed, happily provided for, Clare married the Patty of his verse, and took his parents (his father now a confirmed paralytic) home to live with him. But the annuity, even if regularly paid, would have been insufficient to maintain his household with the new wants which the introduction to a higher grade of society had created. Many of the contributors however failed to keep up their subscriptions, while as the annuity fell off his family increased; he could find no profitable employment; the little trading speculations he entered into were unsuccessful; and as want and misery became imminent, he fell into a deep melancholy, which issued in mental alienation. After awhile the worse form of his disease passed away, and, though still with a mind hopelessly deranged, he requires no constraint. Poetry, which as he wrote used in early life to "lull the throbbings of his woe-worn soul," has proved a solace in the miserable circumstances of his closing days. He lives on talking and thinking chiefly of poetry, and in the harmless delusion that of every passage which recurs to his memory, or which he hears repeated, he is the author.

In 1821 Clare's poems were republished with another and longer piece, under the title of the 'Village Minstrel and other Poems'; a year or two later the 'Shepherd's Calendar and other Poems'; and in 1836 appeared another volume entitled the 'Rural Muse.' His later poems exhibited much greater mechanical dexterity than his earlier ones, and all their hearty enjoyment of rural life and country scenery; while they showed that he had diligently availed himself of the opportunities afforded him of studying the works of the greater masters of the art. But they showed also that Clare had not escaped the danger which besets most untaught writers, of mistaking imitative skill for creative power. His poems however if they display no great strength of thought or striking originality of manner, are not wanting in originality of matter, while they are invariably kindly in feeling, free from all affectation, and often very pleasing in expression.

*CLARENDON, GEORGE WILLIAM FREDERICK VILLIERS, fourth Earl of, born 12th of January 1800; is eldest son of the late Hon. George Villiers, by Theresa, only daughter of the first Lord Boringdon. He succeeded to the title on his uncle's death in December 1838. The founder of the Villiers family was a favourite of James I., whose descendants became ultimately earls of Jersey. About the middle of last century a younger son of the then Earl of Jersey married a daughter of the Earl of Essex, whose countess was heiress of the Hydes, formerly earls of Clarendon and Rochester. [HYDE.] This gentleman, who was successively joint postmaster-general, chancellor of the Duchy of Lancaster, and ambassador at the Court of Berlin, was ultimately created Earl of Clarendon in 1776; and it is his third son who was the father of the present peer.

Lord Clarendon was educated at Cambridge. He entered the civil service at an early age; and in 1823 was appointed to a commissionership of the excise in Dublin by the late Marquis of Anglesey. The ability, intelligence, mental activity, and general knowledge displayed by him in this capacity, recommended him to the home government for some higher employment. Accordingly, in 1831 he was employed by the government in arranging a commercial treaty with France; and, when a crisis arrived in Spanish affairs in 1833, he was sent to the Court of Madrid as British Envoy and Minister Plenipotentiary. Here again, though his stay was prolonged through a period of more than ordinary civil strife and confusion, he was so fortunate as to secure the confidence of the government which he represented, and at the same time the good opinion of the inhabitants of the Spanish metropolis. Soon after his accession to the earldom, in 1838, he returned to England. He had not long taken his seat in the House of Lords, when a speech which he delivered on the question of Spanish affairs attracted the public attention; and, on a re-arrangement of the Melbourne Cabinet taking place in January 1840, Lord Clarendon was appointed Lord Privy Seal, an office to which the chancellorship of the Duchy of Lancaster was added on Lord Holland's death in the same year. In 1841 Sir Robert Peel came again into power, and Lord Clarendon's official duties ceasing, he remained in opposition for

five years. On the accession of Lord John Russell to the premiership in 1846, he became President of the Board of Trade. This position, however, he did not long retain, as on the death of the Earl of Beaconsfield, he was sent to Ireland as Lord-Lieutenant in May 1847. He entered on his viceroyal duties at a period of considerable agitation. Famine and fever had brought on great national distress and suffering, and the death of O'Connell, which had been announced in Dublin a few days previously, was just beginning to cause much popular excitement: the Repeal Association were holding larger meetings and using stronger language than ever; and the partial rebellion of 1848 was beginning to cast its shadow before it. The following extract from Lord Clarendon's answer to an address presented to him by the Roman Catholic prelates, states in few words the spirit in which he entered on his duties as viceroy there:—"The eternal principles of justice and morality can never be violated with impunity, and the unrighteous legislation of bygone times has left in Ireland traces which must be long and severely felt. By penal enactments, doubtless, industry was discouraged, property was unequally distributed, the growth of a middle class was retarded, the people were demoralised, and the whole fabric of society rendered hollow and insecure. The remedy for such a state of things has of necessity been slow and difficult; but it is for the legislature and the government, and for all those who, living in better times and exercising authority, have at heart the true interests of Ireland, to efface the memory of the past, and by equal laws, impartial justice, and forbearing patience, steadily to carry on the great work of social regeneration, and to place the people of Ireland in the position which they are entitled to occupy." In spite however of this declaration, Lord Clarendon was obliged before the end of the year to proclaim several disaffected districts.

The energetic and prudent manner in which he met the threatened danger, and by which he averted the attempt at rebellion in the following year, established his political character in a point of view which the historian of that period will gladly turn to as a proof of the efficiency of a just moderation as opposed alike to a blind security or a violent system of coercion. At a later period he had to repress the excesses of the Orange party, and in so doing displayed firmness and moderation similar to that which the popular tumults had called forth. Lord Clarendon held the viceroyal office till February 1852, when, with the other members of the Russell-ministry, he resigned, and was replaced by the Earl of Eglinton. His impartial rule exposed him to the censures of the more violent writers and orators belonging to both the extreme parties which so long divided Ireland; but now that strife has somewhat subsided, all parties seem willing to acknowledge Lord Clarendon's desire to improve the national condition of the people and to increase the prosperity of the country. Immediately on the formation of the Aberdeen ministry, Lord Clarendon gave in his adhesion to the coalition cabinet, and took the seals of the Foreign Office, for which it was felt that he was admirably fitted by his address and skill in diplomacy, and from his deep insight into the views and feelings of the various courts and cabinets of Europe. The ability with which he has discharged the duties of that office since January 1853 has been repeatedly recognised, not merely by friends, but by political opponents; so much so, that when, in 1855, Lord Derby ineffectually attempted to form a ministry, he confessed that, in the event of becoming premier, he would have been ready to offer the Foreign seals to Lord Clarendon. On the accession of Lord Palmerston to power in February 1855, no change was made in the Foreign department. Accordingly, in the great and stirring events of the last three years, Lord Clarendon has been forced to occupy a leading position, and he has played a distinguished part well. But though he showed a proper energy in supporting the conduct of the war, Lord Clarendon was not unmindful of the blessings of peace, and did not desire to carry on hostilities further than was sufficient to secure the foundation of an honourable and lasting peace. Accordingly, when it was announced that a peace congress was about to be held at Paris, the nation looked to Lord Clarendon to take part in it on behalf of England. This duty Lord Clarendon discharged in conjunction with Lord Cowley, the British ambassador at Paris. In a speech delivered at the opening of the session of parliament in 1856, he explained fully the views with which her Majesty's ministers would enter on the negotiation with Russia. While he denied that the English government intended to carry on the war after the primary end and object had been attained, he still declared that until those negotiations should be concluded every preparation would continue to be made for war; and that if a peace should not be arranged the war would be prosecuted with increased activity. It was this speech, probably, which tended more than any other single cause to lead the national mind to acquiesce in the peace recently concluded (April 1856) between the belligerent powers; and the judgment and tact displayed by his lordship in the Congress at Paris have been the subject of no slight or partial praise among all classes. His discreet zeal in the matter of mooted reforms, both civil and religious, in the states of the Italian peninsula, has also been deservedly commended.

Lord Clarendon married in 1830 a sister of the present Earl of Verulam, by whom he has a youthful family. He was created a G.C.B. (Civil) in 1838, and in 1849 rewarded with the knighthood of the Garter. Of his brothers, one has been recently advanced to the bishopric of Carlisle, and the other is the Right Hon. Charles Pelham

Villiers, Judge-Advocate-General, and M.P. for Wolverhampton, whose early exertions in the cause of Free Trade are not likely to be easily forgotten by the British public. A sister of the Earl of Clarendon, Lady Theresa Lewis, is favourably known as the authoress of the series of biographical sketches entitled 'Friends and Contemporaries of the Lord Chancellor Clarendon.'

* CLARK, SIR JAMES, BART., Physician in Ordinary to the Queen, was born at Cullen, Banffshire, in December 1788. He received his early education at the grammar-school of Fordyce, and afterwards entered King's College, Aberdeen, where he took his M.A. degree. He next studied medicine at Edinburgh, and passed the College of Surgeons of that city and of London. In 1809 he entered the navy, and held his appointment afloat till 1815, when he returned to Edinburgh, and in 1817 took the degree of M.D. in that university.

Dr. Clark then travelled on the continent, and settling in Rome practised there eight years as physician; and during this period he visited the principal universities and medical schools in Italy, France, and Germany. He had thus an opportunity of becoming acquainted with the most eminent professors and physicians in Europe, and favourable means of observing the state of the profession, and the mode of conducting medical education in the principal medical schools of the continent. He visited also the most reputed mineral waters of those countries with the view of becoming acquainted with their effects on diseases; and while residing and travelling in Italy his attention was particularly directed to the nature and effects on health and disease of the different climates of the places frequented by invalids, more especially the effects on consumptive patients.

Dr. Clark having become known to Prince Leopold of Saxe Coburg at Rome, was appointed by him his physician in 1824. Two years later he returned to England, and having settled in London, was soon after appointed physician to St. George's parochial infirmary. In 1829 appeared his work 'On the Sanative Influence of Climate' (4th edit. 1856), which has become an authority. It contains the clearest and most philosophical account of the climates resorted to by invalids in this country and abroad; and meteorological tables, which at the date of publication were the best constructed and most complete of any before published in England. They have served as the basis of what has since been done in the same direction.

In 1832 Dr. Clark was elected a Fellow of the Royal Society; and on the death of Dr. Maton in 1835 he was appointed physician to the Duchess of Kent and the Princess Victoria; and became Physician in Ordinary on her Majesty's accession to the throne. It was in 1835 that he published 'A Treatise on Pulmonary Consumption and Scrofulous Diseases,' which, by its clear exposition and able reasoning, has had a material influence in altering the once mistaken mode of treating those diseases. Dr. Clark was the first to show the origin of consumption to be a deteriorated condition of the system; that the affection of the lungs was the result of a cachectic state of the constitution which he termed Tubercular Cachexia. The accuracy of this view has been recognised, and the term adopted to express the deteriorative character of consumptive and scrofulous diseases.

On the establishment of the University of London, Dr. Clark was chosen on the senate. While inquiring into the state of medical education in the foreign universities and medical schools, he had observed the superiority in several important respects of their methods of instruction, more especially that of clinical instruction. His views on this subject were published in his pamphlet 'On Clinical Instruction.' The defect therein signalled is still, we believe, one of the chief defects in medical education in this country. It has been remedied by the senate of the University of London, so far as regards the medical graduates of that institution.

Sir James Clark was created a baronet in 1838. He is a member of some of the chief foreign societies, scientific and medical, and has been chosen several times on the council of the Royal Society. In addition to his other claims to distinction, it is well known that he has taken a warm interest in sanitary reform, and has exerted his influence to promote the hygienic measures for the improvement of the public health, which now happily occupy the attention of government as well as of the nation. The article 'Change of Air' in the 'Cyclopædia of Prac. Med.' 1832, and one or two minor publications on medical reform, are from his pen.

CLARK, WILLIAM TIERNEY, a civil engineer, was born at Sion House, Somersetshire, August 23, 1783. He was apprenticed when very young to a millwright in Bristol, and followed the trade for several years in that city and at Colebrookdale. In 1808 he removed to London, and entered the service of the late Mr. Rennie as draughtsman; and held the employment until 1811, when he was appointed engineer of the West Middlesex Waterworks. The establishment was at that time on a very small scale—an engine of twenty-horse power supplying the neighbouring hamlets from an insufficient reservoir, yielding no profit to the company. But under Mr. Clark's advice the works were enlarged, and he spared no exertion to render them complete and effectual, until at last there were three pumping-engines of the aggregate power of 245 horses, and reservoirs capacious enough to contain from 35 to 40 million gallons, and producing an annual rental of nearly 70,000*l.* This post he retained for the rest of his life.

In 1819 Mr. Clark undertook to complete the Thames and Medway Canal, a work which had been stopped for want of capital, and under

his direction it was finished some years afterwards; and the great tunnel through the Frindsbury hills remains as a solid proof of his ability. His next work was the suspension-bridge over the Thames at Hammersmith, which was commenced in 1824 and finished in 1827. It is chiefly remarkable for the small deflection of the chains between the chord-line or points of suspension. The suspension-bridge at Marlow was also designed by Mr. Clark, and he was employed by the late Duke of Norfolk to build one over the Arun.

Mr. Clark was however best known by the suspension-bridge which he constructed across the Danube at Pesth. It was begun in 1839 and finished in 1849, at a cost of 622,000*l*. At times the bursting of dams and the pressure from accumulated ice in the winter threatened a total stoppage of the works, but all obstacles were overcome by the energy and perseverance of Mr. Clark, and the bridge remains an admirable monument of his genius and skill. To quote his own words from the volume in which he describes the bridge, it "encountered probably more difficulties than any structure of a similar kind in existence. The magnitude of the river over which it is thrown, the depth and nature of its bed, and the velocity of the current, created the misgivings, at one time almost universal in Hungary, that no permanent communication could ever be established across the Danube between Buda and Pesth. The moral difficulties to be overcome, no less than the physical obstacles, were very great. Pride, prejudice, and jealousy, had each to be encountered." Mr. Clark received a box set in brilliants from the Emperor of Austria in token of his approbation at the successful completion of the bridge, and the late Emperor of Russia sent him a first-class gold medal in return for a design for a magnificent suspension-bridge to be erected across the Neva.

Mr. Clark was elected a Fellow of the Royal Society in 1837; he was a Fellow also of the Astronomical Society, and a member of the Institution of Civil Engineers. He died September 22, 1852.

CLARKE, ADAM, LL.D., one of the most esteemed of the early ministers among the Wesleyan Methodists, was born in 1762. His parents resided in the north of Ireland. They appear to have been persons of respectable character; and by his mother, who was a native of Scotland, he appears to have become early imbued with a deep sense of the value of high devotional sentiment in union with religious knowledge. Of education, properly scholastic or systematic, he appears to have received little or none, and the want of it gave a character, and that not a favourable one, to the learning which by his own unwearied exertions he afterwards acquired.

As soon as his mind began to develop its peculiarities, it appeared that Adam Clarke was extremely eager after knowledge, and possessed within himself resources which would enable him to overcome very formidable obstacles. Placed with a linen manufacturer, who lived in the neighbourhood of his father, to learn the trade, he soon found that he was in a situation which afforded no means of gratifying his desire for knowledge. He determined to change the mode of life which had been marked out for him, and he returned to his home. Methodism had been introduced into the part of Ireland in which he resided. His father and mother belonged to that society; and a Mr. Breddon, one of Mr. Wesley's earliest ministers, was a friend and the religious instructor of the family, and to him at this period of his life he seems to have owed much. The religious meetings and classes of the new sect afforded to the preachers a ready opportunity of becoming acquainted with the character and mental capacity of the young men connected with the society, and such as were suited to the work and were willing to devote themselves to the ministry were gladly received. The union of considerable natural powers with no mean attainments, considering the great disadvantages under which he lay, and of the love of study, with a mind eminently devotional, pointed out young Clarke to the Methodist preachers who frequented his father's house, as one who might be very useful in the ministry among the people with whom his family had formed their religious connection. Their impression that this was the course of life pointed out for him, was communicated to the great father and director of Methodism. The result was that Clarke removed to England, and was admitted into the school which Wesley had founded at Kingswood near Bristol. He now gave himself up wholly to the acquisition of such knowledge as might be useful in his calling. Besides what formed the kind of instruction which was imparted to the students at Kingswood, he undertook to teach himself other things; and it was while here that he began the study of the Hebrew language, which was the commencement of that course of oriental study in which he afterwards spent much time, and made considerable progress.

The time soon came when he was to leave this school, and enter on the duties of an itinerant or travelling preacher. He was accustomed to relate with pride and pleasure that he received his commission to go forth from the mouth of Mr. Wesley himself. There was a peculiar and touching affectionateness in the old man's benediction. The circuit, as it is called, to which he was appointed was a tract of country near Bradford in Wiltshire. Thus in 1782 he became a Methodist preacher, and so continued to the time of his death. In the first twenty years he resided in various parts of the kingdom, but afterwards he lived, for the most part, in or about London, or at an estate which was purchased for him in Lancashire.

In his ministerial character he was singularly acceptable and useful. His preaching attracted crowds. He advanced in influence and repu-

tation in the body of Christians to whom he belonged: and for many of the latter years of his life he was regarded as one of the chief lights and brightest ornaments of that religious community.

If this however had been his only claim to distinction, the name of Dr. Clarke would not have appeared in this work or in the many writings in which, since his death, mention has been made of him. We have already intimated that he was eminently desirous of knowledge of very various kinds, and, while leading the laborious life of a travelling preacher, he found time for a great variety of discursive reading, as well as for much steady application to his philological studies, especially those of Oriental literature. He first gave public evidence of those studies in the year 1802, when he published, in six volumes, his book entitled 'A Bibliographical Dictionary.' This work gave him at once a literary reputation, and though it is not a work of much original research, it was at the time of its publication undoubtedly a very convenient book for the English student, containing as it did a great body of information well arranged concerning books and authors to which no other easy access was presented. The book had an extensive circulation, and has been more than once reprinted.

This work placed Clarke high in reputation among his brethren and the members of his connexion, though at first some were ready to doubt the value of this kind of book learning. He gained also by it a certain reputation among the bibliographical and philological inquirers of his time. About this period of his life his acquirements in Biblical knowledge and in Oriental literature began likewise to be taken notice of. On his coming to reside permanently in London, the Bible Society brought him into connection with some of the dignitaries of the church. His connection with the Surrey Institution gave him access to several persons of literary pursuits, and at the same time an easy access to books. He was admitted a Fellow of the Society of Antiquaries. The University of St. Andrews conferred on him the degree of M.A., and afterwards of LL.D. Some time after he became a member of the Royal Irish Academy. Clarke and his writings undoubtedly did much to remove the feeling of contempt with which many of the cultivated classes were apt to regard Methodism and its followers. The most extraordinary circumstance in his literary history remains however to be mentioned. The Board of Commissioners on the Public Records selected Dr. Clarke as a proper person to superintend the publication of the new edition of Rymer's 'Fœdera,' with the preparation of which they were charged. This was a great and difficult undertaking; for it was not the mere reprinting the work of Rymer, but a large mass of new materials were to be found and to be incorporated with the old. Some eminent antiquarian scholars had shrunk from the task. What particularly pointed out Dr. Clarke as a suitable person for this undertaking is not known, as it was evident that his studies had previously lain in a direction very different from that which pointed to such a work as the 'Fœdera,' and he himself acknowledged that he came to the task with very little acquaintance with the nature of it. He however laboured at it with much assiduity for several years. It is needless to say that archæology gained little by his editorial labours, whatever theology may have lost. His name appears in the title of both parts of the first volume, and in the first part of the second volume, which was published in 1818, and from that time Dr. Clarke relinquished his share in the undertaking.

From the time when he settled in London he was constantly in communication with the press. Of some works he was only the editor; others he abridged; and he prepared some original works, among which are particularly to be named a 'Supplement' to his 'Bibliographical Dictionary,' 'Memoirs of the Family of Wesley,' and a work for the assistance of biblical students. He was also a frequent contributor to the periodical literature of his day. His, as much perhaps as ever any man's, was at this period a life of incessant literary exertion.

But there was one great literary undertaking on which above all his mind was intent. This was an edition of the Holy Scriptures in the English version, illustrated with a commentary and critical notes, into which he proposed to throw the results of his own biblical studies, together with much that he might collect from preceding commentaries. It was to form a kind of Family Bible, and yet be at the same time a book which the biblical scholar might consult with advantage—a union which has been several times attempted. The first volume appeared in 1810, and excited no small attention on account of the novelty of some opinions expressed in it respecting the tempter of our first parents. From this period he pursued this work as the main business of his life, till he had completed it, which he did in 1826, when appeared the eighth and last volume. For eight of these years, namely, from 1815 to 1823, he lived at a place called Millbrook in Lancashire, where some friends had purchased for him a house and small estate.

We have not attempted to give an estimate of the literary value of Dr. Clarke's publications, or even to enumerate them all. As literary works they have their full need of fame. It would be absurd to place his scholarship on a level with that of the really great scholars, who have adorned our country; and many of the works which he undertook were such as required the union of the greatest attainable scholarship with a carefully-trained judgment and sound taste. It is perhaps one of the most observable circumstances about Dr. Clarke that his mind never seems to have acquired that refinement which

scholarship, when it is genuine, never fails to give, or that superiority to vulgar prejudices and to the affectation of display which is, we believe, the usual accompaniment of high attainments. There is in Dr. Clarke a remarkable affectation of bringing forward the Oriental learning he is understood to have possessed. He cannot keep it out of the introduction to the 'Fœdera.' It appears still more strangely in his 'Lives of the Wesley Family,' where he labours after an Arabic etymon of the surname of Wesley, a word really formed according to one of the commonest analogies of our own language. In the same work he gives encouragement to the most vulgar and childish of the popular superstitions. But while we make these remarks, we wish it to be understood that we regard Dr. Clarke as a person on whom it is impossible to look but with very great respect. He was in every sense of the word a good man, and his life presents an instructive lesson of rewards and honours attending useful labours and consistent virtuous action. We may add also that it shows how the cultivation and encouragement of the devotional spirit may be united with very vigorous exertion in things which have but a slight connection with it.

We must not omit to add two or three circumstances of his later years. While he resided in Lancashire the two Buddhist priests whom Sir Alexander Johnston brought from Ceylon for instruction in Christianity were placed in his family; he was the means of establishing a Methodist mission in the Shetland Islands; and in 1831, a little before his death, he had the satisfaction of establishing schools in the province of Ulster, the part of Ireland in which he was born. He accumulated a good library, including many manuscripts, and had formed a small museum of natural curiosities. From 1823, when he left Lancashire, Dr. Clarke resided at Haydon Hall in Middlesex, about 17 miles from London. He died of cholera, on the 26th of August 1832. His 'Miscellaneous Works' have been published in 13 vols. 12mo, London; and a 'Life' by J. B. B. Clarke in 3 vols. 8vo, 1838.

CLARKE, EDWARD DANIEL, LL.D., &c., was descended from a literary family, and born at Willington in Sussex on the 5th of June 1769. He received part of his early education in the grammar-school of Tunbridge, at that time conducted by Dr. Vicesimus Knox, and thence proceeded in 1786 to Jesus College, Cambridge. Having taken his degree, he was engaged by the Duke of Dorset in 1790 as tutor to his nephew, Mr. H. Tufton, with whom in the course of the following year he made the tour of Great Britain. Clarke had always been fond of books of travel, and this journey confirmed his passion, and led to his first essay in travel-writing. He published his journal, but without his name, and was very soon ashamed of it. The edition, which was in 2 vols. 8vo, with plates in aquatinta, is now extremely scarce. In 1791 he made a trip to Calais, and seems to have been delighted beyond measure at putting his feet on foreign land. In the course of the following year he engaged as a travelling companion to Lord Berwick, with whom he went through France, Switzerland, and Italy. He returned to England at the end of 1793. In the course of the following year he went again to Italy by the Rhine and the Tyrol, and returning again to England he was chosen fellow-elect of his college, a barren honour without any emolument. For want of a better occupation he for some time thought seriously of joining the Shropshire militia, in which he was offered a lieutenancy: but in September 1794 he became tutor in a distinguished Welsh family (that of Sir Thomas Mostyn), with whom he resided some time in Wales, where he made the acquaintance of Mr. Pennant. He was afterwards connected in the same manner with the family of Lord Uxbridge, with a member of which he made the tour of Scotland and the Western Isles in 1797. In all these excursions he kept journals, and practised himself in the art of observing scenes and objects, and describing them. About this time he was elected fellow of his college, and being in addition appointed burar, he took up his residence at Cambridge at Easter, 1798. In the spring of the following year he set out with Mr. Cripps, a young man of fortune, on a tour to the countries north of the Baltic. This journey, which was at first intended to occupy only six months, was continued through more than three years and a half, during which master and pupil traversed Denmark, Norway, Sweden, Lapland, Finland, Russia, Tartary, Circassia, Asia Minor, Syria, Palestine, part of Egypt, Greece, Turkey in Europe, and finally returned from Constantinople, across the Balkan Mountains, through Germany, France, &c., to England. In consequence of their donations to the University of Cambridge, and other merits, Clarke received the degree of LL.D., and Cripps that of M.A. Among their valuable donations was a fragment of a colossal statue of the Eleusinian Ceres, of the best period of Grecian art. Clarke was also the means of securing for his country the ancient sarcophagus, generally but incorrectly called that of Alexander the Great, now in the British Museum. He made considerable collections of medals, minerals, and rare plants; many of the latter he procured from Professor Pallas in the Crimea. The valuable collection of manuscripts which he had made during his travels he sold to the Bodleian Library, Oxford. In 1807 he began at Cambridge a course of lectures on mineralogy, which had become his favourite subject; and at the end of the following year the university established a regular professorship of mineralogy in his favour. Having been ordained in 1805, he received the college living of Harlton, and about four years later he obtained the living of Yeldham from Sir William Rush, whose daughter he had married in 1806. From this time his

life was almost entirely passed at Cambridge or in its immediate neighbourhood. In 1810 he published the first volume of his 'Travels,' the second volume appeared in 1812, the third in 1814, the fourth in 1816, and the fifth in 1819. A concluding volume, edited by Robert Walpole, was brought out after his death, making the sixth volume, 4to. His 'Travels,' by which he is chiefly known, are the most popular of his works, and are written in a style which invariably captivates the reader. Full of enthusiasm, and gifted with a prolific imagination, he throws a charm over all that he describes; but unfortunately his judgment was not sufficiently formed by proper discipline, and neither his observations nor his conclusions can always be relied on. His essays and experiments in physics chiefly appeared in Thomson's 'Annals of Philosophy,' which contain his accounts of the blowpipe, cadmium, &c. In 1803 he published 'Testimonies of different authors respecting the colossal Statue of Ceres,' and in 1805 'A Dissertation on the Sarcophagus in the British Museum.' He died at Pall Mall, London, on the 9th of March 1822, and was buried in Jesus College Chapel on the 18th of the same month. (*Life and Remains of Edward Daniel Clarke*, by the Rev. William Otter, M.A., 2 vols. 8vo, London, 1825.)

CLARKE, DR. SAMUEL, was born in October, 1675, at Norwich, where, at the free school, he was distinguished for his progress in classical studies. He entered, in 1691, at Caius College, Cambridge, and applied with great success to the mathematics, under an able tutor, Mr., afterwards Sir John Ellis. The text-book then used in the university was a rugged Latin version of the treatise of Rohault, an implicit follower of the Cartesian theory. Clarke, at the age of twenty-one, after closely studying and justly appreciating the reasonings of Newton's 'Principia,' which had then just appeared, published a more classical version of the text of Rohault, with numerous critical notes, added with the view of bringing the Cartesian system into disrepute by exposing its fallacies. After passing through four editions as the university text-book, it gave place, as Clarke desired, to the adoption of undisguised Newtonian treatises. He now went through a diligent course of biblical reading, in the original languages, in the course of which he carefully studied the early Christian fathers. On his ordination he was introduced to Dr. More, bishop of Norwich, by Whiston, whom he succeeded as domestic chaplain to that bishop for twelve years. In 1699 he published three essays on Confirmation, Baptism, and Repentance, together with Reflections on Toland's 'Amyntor,' concerning the uncanonical Gospels. Two years afterwards followed his 'Paraphrase on the Four Gospels,' which induced Bishop More to present him with the living of Drayton, near Norwich. In 1704 he was appointed to preach the Boylean lecture at Oxford, when he chose for his subject 'The Being and Attributes of God.' The satisfaction which he gave on this occasion led to his re-election the following year, when he read a series of lectures on the evidences of natural and revealed religion. These discourses were arranged and published as a continuous argument, and passed through several editions with successive improvements.

Clarke's mode of demonstrating the existence of God by a process of reasoning from an *a priori* axiom, is precisely that of Spinoza, against whom the argument of Clarke is especially directed. Both take the same point of departure, and agree that, since something does exist, something always has existed. They assert that eternity and immensity, time and space, or duration and extent (for each of these pairs of terms is used without distinction), have always existed, the conception of their non-existence being impossible. It is then considered that, as these are only attributes or qualities, they must necessarily imply a co-existent substance whose attributes they are: a necessary and eternal Being is therefore acknowledged by both, but as to the nature of this Being they differ entirely. Spinoza, like some of the Greek philosophers, concludes this eternal and necessary substance to be the universe itself, material and mental (*ὁ πᾶν*), which he declares to be the great and only God in whom we live, and move, and have our being. (Compare the passage of Pope's 'Essay,' "All are but parts of one stupendous whole," &c.) Clarke asserts that this substance, of which duration and extent are the attributes, is an immaterial and spiritual Being; this metaphysical notion is probably derived from a passage in a scholium of Newton's 'Principia,' where it is said, "Durat (Deus) semper et adest ubique; et, existendo semper et ubique, durationem et spatium constituit," &c. Spinoza takes no notice of design as evidence of intelligence; and Clarke, in assigning to his personification of eternity and immensity certain moral attributes in accordance with his metaphysical hypothesis, admits that intelligence, in which lies all the difference between the Theists and Atheists, cannot be demonstrated by any reasoning *a priori*, but must depend for proof on the *a posteriori* evidence from observation and induction (prop. 8.) According to his premises, he cannot by logical sequence avoid landing himself on the same ground with Spinoza. Numerous replies and objections to this *a priori* argument appeared at the time of its first publication. (See a list in Kippis's 'Biog. Brit.,' and the correspondence between Butler, afterwards bishop of Durham, and Clarke, printed at the end of Bishop Butler's Works.) One of the principal was 'An Inquiry into the Ideas of Space, Time,' &c., by Bishop Law. The most subtle scholastics, Albert, Aquinas, and Scotus, rejected the *a priori* proof as an obvious *petitio principii*, and many modern writers regard the performance of Clarke as a failure. Pope, who on several occasions

says sarcastic things of Clarke, alludes to it in the following passage of the 'Dunciad,' b. iv., l. 455:—

"We nobly take the high-priori road,
And reason downward till we doubt of God."

Other writers and thinkers of perhaps equal ability assent to his argument. The 'Evidences' also met with strong opposition. The foundation of morality, according to Clarke, consists in the immutable differences, relations, and eternal fitness of things. The last expression being of frequent occurrence in this discourse, acquired a fashionable usage in the ethical vocabularies of the day. Regardless of moral sentiment, so fully developed since by Shaftesbury, Hutcheson, and Adam Smith, Clarke insists solely upon the principle that the criterion of moral rectitude is in the conformity to, or deviation from, the natural and eternal fitness of things: in other words, that an immoral act is an irrational act, that is, an act in violation of the actual ratios of existent things. The endeavour to reduce moral philosophy to mathematical certainty was characteristic of that age, and led to the formation of theories remarkable perhaps more for their ingenuity than utility. Dr. Price is an apologist for the moral theory of Clarke, and among its opponents we may instance Sir James Mackintosh. (Dissertat. 'Encyc. Brit.')

In 1706 Clarke obtained, through Bishop More, the rectory of St. Bennett's in London. He published in the same year an answer to the treatise of Dr. Dodwell 'On the Soul,' in which that divine contends that it is not immortal until made so by baptism. Several rejoinders followed on each side. [COLLINS, ANTHONY.] Clarke at this time published a Latin translation of the treatise 'On Optics,' by his friend Sir Isaac Newton, who in acknowledgment presented him with 500*l.* for his five children. His patron, Dr. More, next procured for him the rectorship of St. James's, and a chaplaincy to Queen Anne, which induced him to take his degree of D.D. In 1712 he published his edition of Cassar's 'Commentaries,' in folio, with notes, and some fine engravings. The same year appeared his treatise on 'The Scripture Doctrine of the Trinity,' a work which involved him for the remainder of his life in a controversy, in which his principal adversary was Dr. Waterland. The Lower House of Convocation, in 1714, complained to the bishops of the heterodox and dangerous tendency of its Arian tenets, and Clarke was prevailed upon to declare that he was sorry for his offence. A circumstantial account of this proceeding is given in the 'Apology for Dr. Clarke,' 1714. His favourite subject was the doctrine of philosophical liberty and necessity; on which he began, in 1715, to carry on an amicable controversy with Leibnitz. In advocating the doctrine of free will, Dr. Clarke had constantly in view the subversion of the writings of Spinoza. The death of Leibnitz left the controversy undecided, and Clarke soon afterwards resumed his argument in reply to the 'Philosophical Inquiry concerning Liberty,' by the friend of Locke, Anthony Collins.

In 1718 Dr. Robinson, bishop of London, put forth a pastoral letter, in which he strictly prohibited his clergy from adopting the Arian modifications of the primitive doxologies which had been supported by Dr. Clarke, a prohibition which called forth many pamphlets. In 1724 Clarke obtained the mastership of Wigston Hospital, and published a volume of seventeen sermons. On the death of Newton he declined the offer of the mastership of the Mint. At this time he published in the 'Philosophical Transactions' (401) a paper on the velocity and force of bodies in motion. In 1729 appeared his edition of Homer, with Latin version and notes, which is still used in schools. The last nine books were not prepared by Dr. Clarke. He died rather suddenly in May, 1729. His 'Exposition of the Church Catechism,' and ten volumes of sermons, were published after his death. The moral character of Clarke is praised by all his biographers: his temper was remarkably mild, and his manners modest and unassuming. As a writer he is plain and unaffected; very accurate, but monotonous, tame, and jejune. Voltaire, not inaptly calls him a 'moulin à raisonnement.' He was a wary and very skilful disputant, well disciplined in the scholastic logic. Inferior to Locke in comprehensiveness and originality, he was greatly superior to him in acquirements, being eminent as a divine, a mathematician, a metaphysician, and a philologist.

(Life by Bishop Hoadley; Whiston, *Historical Memoirs*; D. Stewart and Mackintosh, *Dissertations in Encyc. Brit.*)

CLARKSON, THOMAS, was born March 26, 1760, at Wisbeach, Cambridgeshire, where his father, who was a clergyman, was master of the free grammar school. He was at first educated under his father, and after that was sent to St. Paul's School, London, and thence to St. John's College, Cambridge, where he gained the first prize for a Latin dissertation proposed for the middle bachelors. In the following year, 1785, the Vice-Chancellor of the University announced as the subject of a Latin dissertation for the senior bachelors, 'Anne liceat invitis in servitutem dare?' ('Is it right to make slaves of others against their will?'). The prize was awarded to Clarkson for his essay, which was read with great applause in the Senate House, in June, 1786. He had used much industry in collecting materials for this dissertation, and had become greatly excited by what he had read of the miseries to which the slaves were subjected in the carrying on of the trade. He resolved to use all his efforts to get it suppressed, and in order to do so relinquished his chances of advancement in the church, for which he had been intended, and in which he had taken deacon's orders.

He translated his essay into English, and its publication brought him into connection with a small body of Quakers who had for several years formed an association for the suppression of the slave-trade, and he was afterwards introduced to Mr. Wilberforce, and other persons of influence. William Penn in 1688 had denounced the trade as cruel, impolitic, and unchristian; in 1727, at a general yearly meeting of the Quakers in London, it was declared "that the importing of negroes is cruel and unjust, and is severely censured by the meeting;" and in 1760 a similar meeting passed a resolution to exclude from their society all who "participated in any way in that guilty traffic." While Mr. Wilberforce, seconded by a party which gradually increased, repeatedly brought the question before the House of Commons, Mr. Clarkson was labouring without the walls of parliament, was collecting evidence, writing letters and pamphlets, and attending meetings at Liverpool and Bristol, then the chief centres of the trade, and at Plymouth, Bridgewater, and other places. He even went to Paris, and remained there six months in the greatest heat of the French revolution, furnishing Mirabeau with materials for speeches against the trade, which were delivered before the French Convention, but without producing the desired effect. In England however, after more than twenty years of incessant exertion, the cause was won: a law for the entire abolition of the trade in slaves was passed March 25, 1807, Mr. Wilberforce having first brought the subject before parliament in 1787.

But the exertions of Clarkson and his supporters, who had now become numerous, did not terminate with the suppression of the trade in slaves. The struggle was afterwards continued during another twenty years for the total abolition of slavery in the British West India Islands. In 1833 their efforts were again crowned with success, by the passing of the Emancipation Act, which liberated nearly a million of slaves, and awarded twenty millions of pounds sterling as compensation to their late owners. Declining health had prevented Clarkson from appearing in public during the latter years of the movement. Cataract had formed in both his eyes, and for a short time he was quite blind. He underwent an operation which completely restored his sight, and in 1840 he made his last public appearance at a meeting of the Anti-Slavery Convention at Exeter Hall, over which the Duke of Sussex presided. His talents and untiring energy were unanimously acknowledged, and he was enthusiastically greeted as the patriarch of the cause. He died at his residence, Playford Hall, Sussex, September 26, 1846, at the age of eight-six.

Besides several pamphlets and other small works, all bearing more or less directly on the one great object to which he had devoted his life, Mr. Clarkson published, in 1806, 'A Portraiture of Quakerism,' 3 vols. 8vo; in 1808, 'The History of the Abolition of the Slave Trade,' 2 vols. 8vo; in 1813, 'Memoirs of the Public and Private Life of William Penn,' 2 vols. 8vo; and in 1836, 'Researches, Antediluvian, Patriarchal, and Historical,' 8vo.

(Thomas Taylor, *Biographical Sketch of Thomas Clarkson; Gentleman's Magazine.*)

CLAUDE. Claude Gellée, called Claude Lorraine, was born at Champagne in Lorraine in 1600. His parents were very poor, and it is said by Sandrart, who was later in life the intimate associate of Claude, and his instructor in the practice of painting from nature, that he was originally apprenticed to a pastrycook. At the age of twelve, being left an orphan, he sought a home at the house of his elder brother, who was in business as a carver of wood at Friburg. A relation, who was a travelling dealer, observing some indications of a love for the fine arts, persuaded his brother to allow the lad to accompany him to Rome. Here he was somewhat unceremoniously deserted by his relative, but received pecuniary assistance from his brother. Seeing some paintings by Godfrey Waals which pleased him, he determined to go to Naples, where that painter then resided, to obtain the benefit of his instruction. At the expiration of two years he returned to Rome, where he engaged himself at first as house-servant to Agostino Tassi, then in considerable repute as a landscape-painter, and under him he studied with unwearied diligence to master the principles of art. Having acquired some repute, he made the tour of Italy and France, and part of Germany, staying occasionally for some time at different places to replenish his purse, and paying a visit to his native place. He appears to have frequently suffered through various misadventures, both in health and fortune, during his protracted tour.

On his return to Rome he was received with a general welcome, and a wide and increasing demand for his pictures. Commissions came to him from numerous places, and from many illustrious persons of the principal countries of Europe. He died in 1682.

Claude is an instance of what may be done by a constant and diligent study of nature, and by unwearied manual practice. It was his custom to spend great part of his time, often whole days, from dawn till night, in watching the changes of the appearance in earth and sky. He has left proofs of the painstaking labour with which he studied the details of a picture in finished studies of leaves and bits of ground. By these means, although it is said very slowly, he eventually acquired such mastery of hand and eye as produced him fame, wealth, and the rank of the first among landscape-painters. He painted for his study a landscape, compounded of many views, taken in the Villa Madama, with an infinite variety of trees, which he kept as a store of natural objects. He refused to sell it, even when

Clement IX. offered to cover it with pieces of gold. This picture, and another of 'Erecher and Abascurus,' he is said to have mentioned as his best productions. He used to make drawings of his pictures in a book, in order to prevent their being pirated. He left six of these registers, which he called his 'Libri di Verità;' one of them, well known by Enlens's engravings, is in the possession of the Duke of Devonshire.

His colouring is rich, powerful, and brilliant; his tints are varied as in nature itself. His aerial perspective is perfect; the foreground stands out with the force and brightness of an Italian sunshine; the distance recedes clear and wide, till the blue hills and blue sky meet in harmonious contrast, or melt into the rich, warm, dewy atmosphere of Roma. His architecture, if not very correct, is light and fanciful, and often charmingly mixed with foliage, which is graceful and moving. The water ripples and undulates in the tremulous light, or lies calm and glassy, with deepening shadows. His composition is a singular union of freedom and symmetry. If his landscapes have a fault, it is that the graceful is too invariably selected; a trifle of roughness, or irregularity, would add to the interest of the picture. Rich and varied as is his foliage, it must be confessed that he is often inaccurate in drawing the skeleton of his trees. His figures too are very poor; this however he freely admitted, saying he sold the landscape and gave away the figures, a trait of modesty which seems in accordance with his mild and amiable character. He left his property to two nephews and a niece, his only surviving relations. Most of the great galleries of Europe possess specimens, more or less excellent, of the paintings of Claude. England is very rich in his works. In the National Gallery there are ten of Claude's paintings, and some of them rank among his finest works. The gallery of the Earl of Grosvenor, and that of Mr. Mills at Leigh Court, near Bristol, also contain some famous specimens of the works of this greatest of landscape-painters. The British Museum possesses a good collection of Claude's drawings.

CLAUDE, JEAN, born in 1619, at Sauvetat, near Agen, was the son of a Protestant clergyman, and was himself brought up to the Church. He distinguished himself in controversial learning, and was appointed professor of theology in the Protestant college of Nismes, which place he filled for eight years. At the end of this time, the vexations of the government authorities obliging him to abandon his chair, he went to Paris, where he was soon after appointed to the church of Charenton, in 1666. In this situation he showed himself by his writings one of the ablest champions of the Protestant doctrines, an antagonist not unworthy of Bossuet, Arnauld, Nicole, and other distinguished Catholic divines. In 1671 he published his 'Réponse au Traité de la Perpétuité de la Foi sur l'Eucharistie,' 2 vols. 8vo. [ARNAULD.] In 1673 appeared his 'Défense de la Réformation, ou Réponse aux Préjugés légitimes de Nicole.' In 1681 Claude had a controversial conference with Bossuet, after which he published 'Réponse à la Conférence de Bossuet.' The conference, as usual, led to no approximation between the contending parties. In 1685 the Revocation of the edict of Nantes by Louis XIV. obliged Claude to seek refuge in Holland, where he was well received, on account both of his talents and his personal character, and the Prince of Orange granted him a pension. He died not long after, January 13, 1687, much regretted by his co-religionists as one of their ablest and most estimable advocates. His 'Plaintes des Protestans cruellement opprimés dans le Royaume de France' was published after his death, as well as other posthumous works, chiefly on theological and controversial subjects; he left also some sermons. His style though simple was vigorous, being sustained by considerable logical skill and erudition. Devèze wrote a biography of Claude, Amsterdam, 1687. His grandson, Jean Jacques Claude, was one of the earliest pastors of the French Protestant Church in Threadneedle-street, London, and died in 1712.

CLAUDIANUS, CLAUDIUS, was born at Alexandria in Egypt, A.D. 365. Though of a family originally Roman, his education was Greek; and he appears to have written first in the Greek language. His work on the 'Antiquities of Tarsus' is lost. His first Latin verses were written during the consulship of Probinus, A.D. 395. In this year he became a dependent of the regent Stilicho, guardian of the two minors, Arcadius and Honorius; and in his poems he sometimes alludes to his soldier's life. Both Stilicho and his beautiful wife Serena warmly befriended the poet, who repayed their kindness by no stinted measure of praise. Claudian seems to have enjoyed all the splendour and luxuries which the high station of Stilicho afforded; and he either purchased or requited those indulgences by lavishing indiscriminate eulogies on his patrons and bringing infamy and ridicule on their enemies.

The most important favour for which he was indebted to Serena appears to have been her assisting him to obtain a very wealthy bride. The nuptials were celebrated at Alexandria, and it seems probable that Claudian and his wife soon after came to Italy. After the war with Gildo he was honoured with a bronze statue, erected in the forum of Trajan, an honour which, as Gibbon (ch. 30) observes, he acknowledged as a man who deserved it: the inscription which was cut on the statue is still extant. (Orelli, 'Corpus Inscript.,' vol. I., p. 259.)

The death of Stilicho (A.D. 408) was soon followed by the ruin of his favourite. Hadrian, the successor of Stilicho, had formerly been the subject of a satirical epigram ('Epigr.,' 25, in some editions 30)

of Claudian, and he now began to watch for a favourable opportunity of revenge. The particulars of Claudian's death are not known; but it seems probable, though some recent scholars have doubted the statement, that his attempts to conciliate Hadrian were ineffectual, and that he finally fell a victim to his resentment.

Claudian's poetical merits are considerable. He does not excel in the chastised and severe beauties of the older poets whom he aspired to imitate, nor is he remarkable for great invention or a lofty imagination; but in what may be called the picturesque style he is surpassed by none: he brings out the smallest details of a scene into a vivid and correct form, amplified and ornamented with all the graces of diction. The most prosaic topic in his hands is invested with the charms of poetry. An elegant and harmonious versification always delights his reader. "In the decline of arts and of empire, a native of Egypt, who had received the education of a Greek, assumed in a mature age the familiar use and absolute command of the Latin language, soared above the heads of his feeble contemporaries, and placed himself, after an interval of 300 years, among the poets of ancient Rome." (Gibbon, 'Decline and Fall,' chap. 30.)

Claudian's principal poems are, 3 books 'De Raptu Proserpinæ;' 3 books 'De Laudibus Stilichonis;' 2 books 'In Rufinum;' 2 books 'In Eutropium;' 'De Bello Getico;' 'De Bello Gildonico,' &c. The best editions are those of Gesner and Burmann. Claudian is included in Weber's 'Corpus Poetarum Latinorum,' Frankfurt, 1833. The poems of Claudian were translated into English by A. Hawkins, Lond., 2 vols. 8vo, 1817.

CLAUDIUS, or CLODIUS, ALBINUS, a native of Adrumetum, in Africa, served with distinction under Marcus Aurelius and Commodus in various parts of the empire; in Asia, in Gaul, in Germany against the Frisians, and lastly in Britain. When Avidius Cassius, governor of Syria, revolted against M. Aurelius, Albinus, who commanded the troops in Bithynia, checked the revolt which was beginning to spread among his soldiers. In consequence of this service he was raised to the consulate, together with Pompeianus, the emperor's son-in-law, A.D. 176. When Septimius Severus became suspected of aspiring to the empire, Commodus, with the view of strengthening himself, offered to Albinus, who was then commanding in Britain, where he had succeeded Pertinax, the title of Cæsar, which Albinus declined. After the assassination of Commodus and of his short-lived successor Pertinax, Didius Julianus being made emperor by the prætorian guards of Rome, assumed the right of disposing of the empire to the highest bidder, three commanders of the legions abroad—Albinus in Britain, Severus in Illyricum, and Pescennius Niger in Syria—stood forth to dispute this right by the corresponding argument of the will of their own soldiers. Severus, who was the nearest to Rome, marched upon the city, upon which the senate proclaimed him emperor, and the prætorians made way for him by assassinating the unfortunate Julianus. Severus while on his march had written to Albinus, proclaiming him Cæsar, and adopting him as his successor. This time Albinus accepted the title, which he assumed publicly at the head of his legions; and the senate confirmed it, after the accession of Severus. But the new emperor having first overthrown his competitor Pescennius Niger, resolved to rid himself also of his dubious associate Albinus; who, having discovered his intentions in time, passed over into Gaul, where he was proclaimed emperor, and strengthened himself by fresh recruits. Severus hurried from the east against this new enemy, and after several partial engagements a great battle was fought near Lyon, in February A.D. 197, in which Severus was worsted at first and wounded, according to Spartianus, but succeeded in rallying his cavalry, with which he gained the victory. The soldiers of Albinus having taken refuge within Lyon, that city was invested, stormed, and burnt, by the troops of Severus. Albinus, according to Dion, killed himself, and his body was carried to Severus, who had the head cut off and taken to Rome, and the body thrown into the Rhone. Severus, with his characteristic inhumanity, put to death the wife and children of Albinus, and ordered a general proscription of all his friends, who were numerous in Gaul and in Spain, and even at Rome. Albinus appears to have been a man of considerable talents and information. He was a distinguished commander, and had many partisans among the senators, but was harsh and even cruel in his military discipline: and is said by Capitolinus to have been an enormous glutton. (Herodian, Dion, and Spartianus; and Julius Capitolinus in the *Historia Augusta*.)

Coin of Claudius Albinus.

British Museum. Actual size. Bronze. Weight 337 grains.

CLAUDIUS, MARCUS AURELIUS, surnamed GOTHICUS, was born in Illyricum A.D. 214, served in the army as tribune under Decius, was afterwards governor of his native province under Valerianus, and after the death of Gallienus in 268, near Milan, was proclaimed emperor by the army. The choice was immediately approved by the Senate. Claudius began his reign by defeating the usurper Aureolus, who had revolted against Gallienus, and had taken possession of Milan. Aureolus was killed in the battle. Claudius afterwards marched against the Germans, who had entered Italy, and defeated them on the banks of the Benacus (Lake of Garda). On arriving at Rome, he was received with great honour, and applied himself to reform many of the abuses which existed in the administration of the empire. In the following year he marched against the Goths, or Scythians, who had invaded the province of Moesia, defeated them with great slaughter, and made a vast number of prisoners, whom he distributed over various provinces as labourers. In consequence of this victory, he assumed the name of Gothicus. In the year after (A.D. 270) he died at Sirmium, in Pannonia, of a contagious disease which had spread in his army, after a short reign of little more than two years, during which he exhibited virtues and abilities that entitle him to be numbered among the best emperors of Rome. The Senate named his brother Quintilius his successor, but the army proclaimed Aurelianus, upon which Quintilius was killed, or killed himself according to others. (Trebellius Pollio in *Historia Augusta*.)

Coin of Claudius Gothicus.

British Museum. Actual size. Bronze. Weight 125 grains.

CLAUDIUS NERO, the son of Drusus Nero, the brother of Tiberius, and of Antonia Minor, the daughter of M. Antonius the Triumvir, by Octavia, the sister of Augustus, was born at Lyon B.C. 10. [Augustus.] In his youth he was sickly, weak, and timid, which made his mother say that he was but the half-finished sketch of a man. Augustus, in compassion, used to call him *miellus*, little wretch. He was left to the company of the women and the freedmen of the palace, and little notice was taken of him under Augustus and Tiberius. He lived in privacy, and appears to have applied himself with perseverance to study. He became a proficient in Greek and Latin, and wrote, with the assistance of Sulpicius Flavius, a history of Rome, in 43 books, which is lost. He suggested the addition of three new letters to the Roman alphabet, and he enforced the use of them during his reign, after which they fell into disuse, but still appeared in the time of Tacitus in the old inscriptions ('*Annal.*' xi. 14). He also applied himself with much perseverance to the study and practice of oratory, and Tacitus has transmitted to us a favourable specimen in a speech which he delivered before the senate when emperor, in favour of the Gauls, who were asking to be admitted to the rights of Roman citizens. ('*Annal.*' xi. 24.)

When Caligula, who was the nephew of Claudius, became emperor, he took his uncle as his colleague in the consulship, A.D. 37. After the expiration of his consulship Claudius again withdrew into privacy, from which he was dragged by some mutinous soldiers, who were overrunning the imperial palace after the death of Caligula, and who discovered Claudius concealed behind a tapestry, and trembling from fear. They raised him on their shoulders, and carried him to the camp, where he was proclaimed emperor by the troops in A.D. 41, against the wishes of the senate and of many of the citizens, who were for restoring the republic. This was the first example of that baneful practice, which the soldiers so often repeated, of disposing of the imperial crown. Claudius, who was then fifty years of age, began his reign by acts of justice and of mercy; he recalled exiles, restored to the rightful owners much property which had been confiscated under Tiberius and Caligula, rejected the honours and titles which the flattery of courtiers would have bestowed upon him, embellished Rome, formed an aqueduct for a fresh supply of water, which still bears his name, constructed a harbour at the mouth of the Tiber, and began the emissary of the Lake Fucinus. He also went over to Britain, which country he first permanently occupied, at least in part, by his generals Plautius and Vespasianus, and afterwards by Ostorius. Caractacus, who was brought prisoner before him at Rome, experienced the imperial clemency. Claudius afterwards fell into a state of apathy and imbecility, being entirely governed by his profligate wife Messalina and the freedmen of the palace who were leagued with her. They took advantage of his excessive timidity and credulity to make him sign the death-warrants of numerous senators and knights, whom they represented as conspirators, and whose property was confiscated for their benefit. Messalina openly abandoned herself to the most shameless licentiousness, and no one dared to check her, or remonstrate with the emperor on her conduct, for fear of incurring

her deadly revenge. She carried her effrontery at last so far as publicly to marry Caius Silius, one of the handsomest men of Rome, while Claudius was absent at Ostia. The emperor, who was roused from his torpor by the report of this scandal, gave orders that Messalina should be put to death. Soon afterwards he married (50) his own niece, Agrippina the younger, the widow of Domitius Aenobarbus, and mother of L. Domitius. Agrippina easily prevailed on the weak Claudius to adopt her son Domitius, who assumed his stepfather's name of Nero, by which he was afterwards known as emperor, and to give him in marriage his daughter Octavia. Agrippina having thus paved the way for the succession of her own son to the throne, to the prejudice of Britannicus, the son of Claudius by Messalina, completed her object by poisoning her husband at Sinuessa, where he had gone for the benefit of his health. Claudius died in 54, in his sixty-fourth year, after being in possession of the sovereign power for thirteen years and nine months. His funeral was celebrated with great pomp, and he was numbered among the gods, but his will was not read in public in order to avoid exciting disturbances among the people on account of the preference given to Nero over Britannicus.

(Tacitus, *Ann.* xii. 69; Suetonius, *Claudius*; Dion.)

Coin of Claudius Nero.

British Museum. Actual size. Bronze. Weight 437 grains.

CLAUSEL, BERTRAND, COUNT, Marshal of France, was born at Mirepoix, December 12, 1772. He entered the army very young, and became aide-de-camp to General Pérignon, with whom he served in the army of the Pyrenees, in 1794-95. He was already a brigadier-general when attached to the corps of Leclerc, whom he accompanied to St. Domingo, and soon was raised to the command of a division. On his return from that ill-fated expedition in 1804 he served in Italy and Germany. His services were next transferred to Spain, where he greatly distinguished himself. His name appears in most of the narratives of the great battles; and he was badly wounded at Salamanca. In 1813 he commanded one of the corps d'armées, which were employed against Wellington, and fought the English almost daily during the retreat into France. Having been induced to join Napoleon during the Hundred Days, he was obliged after the restoration to leave his country for several years, and retire to America. Subsequently, having returned to France, he was appointed to succeed Marshal Bourmont as commander-in-chief in Africa in 1830, was created a marshal himself the following year, and governor of Algeria in 1832. Foiled in his attempt upon Constantine in 1836, he returned dispirited to Paris, and closed his arduous life at Toulouse on the 20th of April 1841, his military career in the field having extended over thirty years.

(Rabbe; Feller, *Biog. Univ.*; *Dict. de Conversation*.)

CLAVIGERO, FRANCESCO SAVERIO, was born at Vera Cruz, in Mexico, about 1720. He entered the order of Jesuits, and was sent as missionary among the Indians in various parts of Mexico, where he says, in the preface to his work, he spent thirty-six years, visiting the country in every direction, living at times entirely among the Indians, whose language he learned, collecting their traditions, and examining the historical paintings, manuscripts, and monuments relative to the ancient history of the aboriginal tribes, with the view of writing a correct account of Mexico; since he had found, on reading the Spanish authors who had preceded him, that their works were disfigured by many errors and misrepresentations. After the Jesuits were suppressed by Spain in 1767, Clavigero left Mexico for Italy, where the pope granted to the expelled fathers an asylum in the States of the Church. Clavigero, and others of his brethren from Spanish America, had the town of Cesena assigned to them as their residence; a circumstance which gave Clavigero a good opportunity of comparing his own information with that collected by his brother missionaries in various provinces of Spanish America. He now set about writing his '*History of Mexico*,' which he published in Italian, '*Storia antica del Messico cavata dai migliori Storici Spagnuoli, e dai Manoscritti e dalli Pitture antiche degl' Indiani*,' 4 vols. 4to, Cesena, 1780-1, with maps and plates, which he dedicated to the learned Carl. In the first volume, after a long and critical list of all the Spanish writers on Mexico, the author gives an account of the countries constituting that empire; of their natural history, of their early inhabitants, their various migrations, and of the establishment of the dominion of the Aztecs, and concludes with a sketch of the political state of

the country when Cortez landed on its shores in 1521. The second volume treats of the manners, customs, arts, sciences, and language of the people. The third, which contains the account of the conquest by Cortez, is written with great impartiality. The author feels as a Mexican rather than a Spaniard. The fourth volume consists of dissertations on the physical and moral constitution of the ancient Mexicans, on their progress in the arts and sciences, on their religion, on the proper boundaries of the empire of Anahuac; and lastly, the author gives a list of works written in the various native languages since the conquest, either by Spaniards or natives. In these dissertations Clavigero has at times shown more industry and honest zeal than critical discrimination; his work however is, upon the whole, the best that has been written on ancient Mexico. It was translated into English by G. Cullen: 'The History of Mexico,' 2 vols. 4to, London, 1787. Clavigero died at Casena in October 1793.

CLAVIJO Y FAXARDO, JOSEPH, a Spanish writer, whose name is now better known in France and Germany than in Spain from a train of circumstances which have secured him an unenviable immortality. He was born at Lanzarote, one of the Canary islands, on the 19th of March 1726, and was educated in the Islands for the legal profession, but went in 1749 to seek his fortune in Madrid, and was appointed to a place in the war-office, where he had the merit of first suggesting the publication of a Spanish army-list, the series of which commences in 1763. The year before, 1762, he had begun, under the assumed name of Alvarez y Valladarez, a periodical collection of essays in imitation of the English 'Spectator,' to which he gave the title of 'El Pensador,' or 'The Thinker.' The work was so successful that he soon affixed his real name to it, and the third volume appeared with a royal privilege to protect it from piracy, commencing with the very unusual clause that his majesty had been "informed of the utility and profit which resulted to the public from this periodical undertaking." The king, Charles III., a warm patron of literature, at the same time promised him the first honourable post suited to his merits which should become vacant, and a few weeks after he was named Officer of the Archives of the first Secretary of State.

For some years Clavijo had been acquainted with two French ladies, Madame Guilbert and Mademoiselle Caron, who carried on some kind of business, probably millinery, at Madrid. He had received from them instruction in the niceties of the French language, and some hints in the composition of the 'Pensador,' much of which, like its English prototype, was occupied with speculations on the fair sex. At his first success he made proposals for the hand of Mademoiselle Caron, and the marriage was settled to take place as soon as he received his promised appointment. When the appointment came the lover cooled, and though the bauns had been put up, he ceased to frequent the house. Some scandal was excited, and the French ambassador was applied to. Clavijo began to be afraid of the result, solicited his betrothed for pardon, renewed his vows, brought the affair for the second time to the verge of marriage, and then repeated his desertion. The younger lady became seriously ill, the elder wrote to Paris to complain to their father and family, and their brother, Pierre Augustin Caron, came to Madrid to inquire into the matter. He was then a man of two-and-thirty, scarcely beginning to be known, but he afterwards became celebrated under the title of nobility which he purchased, the title of Beaumarchais. [BEAUMARCHAIS.]

Beaumarchais on his arrival at Madrid introduced himself with a friend to Clavijo, in the character of a French literary gentleman who was travelling, at the request of a literary society at Paris, to establish a correspondence with the most eminent writers of every country, and was of course attracted to the rising hope of Spain, the distinguished author of the 'Pensador.' When Clavijo, who welcomed his proposal with eagerness, inquired if he could serve him in any other way, the stranger, fixing his eyes on him, commenced a narrative of the wrongs of a French lady at Madrid, in which, as it proceeded, Clavijo could not fail with gradually darkening countenance to recognise the story in which he bore a principal part. "The eldest sister," Beaumarchais went on, "wrote off to France an account of the outrage to which they had been subjected, and the story affected their brother to such a degree that he made but one leap from Paris to Madrid. I am that brother, come to unmask a traitor, and to write his soul on his face in lines of blood. The traitor is yourself!" The startled Spaniard began to stammer out an explanation; the prepared and self-possessed Frenchman, pressing his advantage, cut him short with a declaration that what he came to demand was, not the completion of the marriage, but an acknowledgment, under Clavijo's own hand, that he was a villain who had deceived, betrayed, outraged his sister, without a cause. In case of refusal, Beaumarchais told him that he would pursue him till he should be obliged to give him a meeting behind Buenretiro, at that time the common spot for duels at Madrid. "Then, if I am more fortunate than you," he said, "I will take my dying sister in my arms, put her in my carriage, and return at once with her to France. If, on the contrary, fortune favours you, there is an end. I made my will before I set out; you will have every advantage over us, and may laugh at our expense." The interview after a long discussion ended with Clavijo's giving him the declaration he required, bearing on the face of it that it was "free and spontaneous;" and Beaumarchais left him with the understanding that Clavijo was to be permitted if possible to make his peace with his betrothed.

It was on the 19th of May 1764 that this declaration was given on the 20th of May, Marie Louise Caron and Joseph Clavijo signed a contract of marriage, in presence of several witnesses. Then for the third time the 'Pensador' began to waver. A duenna made her appearance who asserted that he had made her a promise of marriage several years before. Beaumarchais suspected, not without some cause, that the duenna was set on by the man she appeared to pursue. Clavijo then shifted his residence, and gave out that he was in fear of violence from Beaumarchais, who had forced him with a pistol at his throat to sign a contract for marrying his sister. The French ambassador advised his countryman to quit Spain as soon as possible for his own safety; but he took the bolder course of forcing his way to Grimaldi, the minister, and a narrative of the whole affair was put through Grimaldi's intervention into the hands of the king. Finally, the monarch in person decided that Clavijo should be deprived of his post, and for ever dismissed from the employment of the state.

Such is the statement of the whole affair made by Beaumarchais ten years after its occurrence. It took place in 1764; in 1774 Beaumarchais, who was then in prison at Paris, engaged in a law-suit with a certain Madame Goetzmann, finding that the public was prejudiced against him by a report that he had been expelled from Spain for discreditable proceedings there, published, as one of the legal documents in his defence, an account of his journey to Spain. His antagonists might have argued from it that, even when he had a good cause to defend, his proceedings were full of artifice; and that, in spite of his stratagems, he failed in his object. But nothing of this kind appears to have been said. It was currently remarked that his enemies, by trying to plunge Beaumarchais into an abyss, had forced him to save himself on a pedestal, and his conduct in the affair seems to have passed for a model of spirit and sagacity. In fact it was the narrative of his adventure with Clavijo that first raised him a reputation. It was read with eagerness and sympathy throughout Europe, and in Germany, falling into the hands of Göthe, it was in eight days turned into a tragedy, which became at once popular on the German and the Danish stage. The earlier part of the play, in which the characters bear their actual names, follows with tolerable closeness the narrative of Beaumarchais; in the latter part the renewed desertion of Clavijo, or as he is called Clavijo, is made to have a fatal effect on his betrothed, who dies of a broken heart, and at her funeral the lover, who is delineated as a man of worth led astray by ambition, dies by the sword of the brother, rejoicing that his death makes some atonement for the wrongs of his beloved.

At the time that Göthe's tragedy was making the names of Clavijo and Maria almost as familiar in northern Europe as those of Romeo and Juliet, Maria Caron had become the wife of a French merchant named Durand, and Clavijo was managing a theatre and editing a newspaper. The narrative of Beaumarchais concludes with the ignominious dismissal of the Spaniard from all his employments—a dismissal which was to last for life, but which appears to have been reversed in a very few years. In a Spanish work, the 'Noticias de la Historia General de las Islas de Canaria,' by Don Joseph de Viera y Clavijo, probably a relative of the author of the 'Pensador,' the fourth volume, published in 1783, which contains a 'Biblioteca de los Autores Canarios,' has a life of Clavijo y Faxardo, which enables us to obtain a glimpse at his side of the question. "He was," says the friendly biographer, "an officer of the archives of the chief secretariat of state in 1764, when a monster from France came to disturb his fortunes and to interrupt his useful labours. I give the name of monster not without reason to that Pierre Caron de Beaumarchais, who is known throughout Europe for his machinations, his law-suits, his adventures, his writings, his comedies, and his talents. He did not hesitate to publish in Paris in 1774 all the harm he had done to our Don Joseph Clavijo, by making himself here in Madrid the Don Quixote of a sister who aspired to his hand (que aspiraba a su mano). It would have been easy for Clavijo to refute a story so full of fictions that Wolfgang Göthe, a German poet, thought he found in it sufficient argument for a German tragedy called 'Clavijo,' which was translated into French by M. Friedel; but he rather chose to give the world a rare example of Christian philosophy and generosity, by causing to be acted in the theatre of the royal palace, of which he was at that time chief director, a comedy by this very Beaumarchais, entitled the 'Barber of Seville.'"

The defence of Clavijo, thus put forth evidently under his own auspices, leaves him in a worse position, when it is known, than he occupied before. In the 'Biographie Universelle,' Bourgoing, and in the 'Dictionnaire de la Conversation,' Audiffret, both Frenchmen, have taken up his defence, remarking that his only fault was that he could not love for ever, and that he was the victim of the hatred of Beaumarchais; but a man who is only able to reply to an accusation of having three times broken a contract of marriage, in one case formally signed, by a vague sneer at the lady who "aspired to his hand," without a denial of the facts alleged, is a man not to be excused. It should be remarked also that in the memoirs of 'Beaumarchais et son Temps,' published at Paris in 1856 by Louis de Lomenie, the statements respecting his proceedings in Spain appear to be borne out in almost every respect as exact, and that it is shown that he stayed at Madrid for nearly a twelvemonth after his memorable affray with Clavijo, so that there can be no doubt who remained master of the field. The

only material objection to the correctness of his narrative is that the reader is left to suppose that the disgrace in which Clavijo was plunged was lasting. On the contrary, it appears by the 'Biblioteca de los Autores Canarios,' that at all events as early as 1770 he was again in favour with Grimaldi, who in recompence of his excellent essays on the drama in the 'Pensador,' conferred on him the direction of the theatre of the palace. In 1773 he was entrusted by the secretary of state with the editorship of the 'Mercurio historico y politico,' one of the newspapers of Madrid. He translated some plays from the French, and published an original work bearing the title of 'El Tribunal de las Damas' ('The Ladies' Tribunal'), which was pirated in four surreptitious editions, the title probably exciting some curiosity. He was also appointed secretary to the Cabinet of Natural History at Madrid, of which he compiled a catalogue, and he published a translation of Buffon. He died an old bachelor of eighty in 1806.

In addition to the tragedy of Göthe, which is still a stock play in Germany, the story of Clavijo has thrice formed the subject of dramatic treatment in France. 'Norac et Javolci' (an anagram of Caron and Clavijo), by Marsollier des Vivetières, was produced in 1780; 'Beaumarchais en Espagne,' an anonymous work, in 1804; and 'Clavijo, ou la Jeunesse de Beaumarchais,' by Dorat-Cubières, in 1806. The quarrel between two persons, both of whom were afterwards dramatic authors, and one at least a manager, appears to have found singular favour in the eyes of dramatists.

It may be observed that the copy of the 'Pensador' in the British Museum is that which belonged to the German poet Tieck, and contains a note by him to the effect that he obtained it from Baumgärtner, formerly consul at Madrid, who received it from Clavijo himself, and assured Tieck that the third number, which is in manuscript, is in Clavijo's handwriting.

CLAVIUS, CHRISTOPHER, of Bamberg, entered into the order of Jesuits, and died at Rome February 5, 1612, aged seventy-five. He was selected by Gregory XIII. to superintend the reformation of the Calendar, in which capacity he had to endure and reply to the attacks of Moestlinus, Joseph Scaliger, Vieta, and others of less note. As a mathematical writer, Clavius is distinguished by the number of his works, the frequency with which they were reprinted, his rigid adherence to the geometry of the ancients, and the general soundness of his views. According to Riccioli ('Chronicon, Nov. Almag.'), the most learned Germans resorted to Rome, that they might converse with Clavius, and several were accustomed to say that they would rather be attacked by him than praised by others. As Clavius did not possess any great original talent, his works are now of little consequence, except to the mathematical historian. The following is the list of those which have been mentioned by succeeding writers:—

1, In 'Sphæram Johannis de Sacro-bosco Commentarius,' Rome, 1570, reprinted more than a dozen times: the last edition we can find is that at Leyden, 1618. 2, 'The Works of Euclid,' with a commentary; Rome, 1574; Cologne, 1591; Frankfurt, 1607, &c. 3, 'Epitome Arithmetica Practica,' Rome, 1583; Cologne, 1637, &c. 4, 'Edition of the Spherics of Iheodossius, with a Table of Sines, Tangents, &c.,' Rome, 1586. 5, 'A work on Gnomonics,' Rome, 1587; several times reprinted. 6, 'Defence of the Calendar against Moestlinus,' Rome, 1583. 7, 'Fabrica et Ueus, &c.,' a work on Horology, Rome, 1586; 'Constructio, &c.,' a second work, Louvain, 1595; 'Horol. Nov. Descr., &c.,' a third, Rome, 1599. 8, 'On the Astrolabe,' Rome, 1593, &c. 9, 'Refutation of J. Scaliger on the Calendar,' Rome, 1595; Mayence, 1609. 10, 'Romani Calendarii a Greg. XIII. Restituti Explicatio,' Rome, 1603. This is to us the most important of the works of Clavius: it contains the description of the reasons and methods employed in the alteration of the calendar, with the answer to Vieta and others. 11, 'Elements of Algebra,' Rome, 1604. 12, 'Geometria Practica,' Rome, 1604. 13, 'Refutation of George of Wirtemberg on the Calendar,' Rome, 1610. We have taken the earliest editions which we could find in any of the authors cited at the end.

A complete edition of the works of Clavius was published at Mayence in 1612. The account of the Calendar is in the fifth and last volume.

(Riccioli; Weidler; Blancanus; Lipenius; Bouillaud, *Cat. Bibl. Thua.*; Lalande; Delambre.)

CLAY, HENRY, was born in Hanover county, Virginia, April 12, 1777. He was the seventh son of a clergyman who died when Henry was very young, leaving his widow and family but scantily provided for. Having received a common school education, Henry obtained a situation as copying clerk in the chancery court of Richmond. Here he probably received a certain amount of initiation in legal proceedings, so that, although he was nineteen years of age when he formally commenced the study of the law, he was when only twenty admitted to practise at the bar. The tide of migration was then setting strongly westward, and the young advocate thought that the fertile valleys of the west offered for him also a promising field of labour. He accordingly removed to Lexington in Kentucky, and there, in October 1799, he fairly commenced his legal career. As an advocate he quickly achieved a marked success. Young Clay, it was soon seen, not only possessed great natural ability, and doubled its value by constant diligence, but had the more marketable talent of knowing how to manage a jury. Yet though he found himself on the road to fortune, his ambition was directed rather towards political than pro-

fessional success. The convention for framing a constitution for the state of Kentucky soon afforded him the opportunity he desired of taking a prominent part in political movements. His advocacy of a provision for the gradual abolition of slavery entailed on him some temporary unpopularity, but this was removed by his opposition to measures which were regarded as an encroachment on the part of the central government, and he was at the next election (1803) returned to the state legislature.

His political career was now fairly begun, and for nearly fifty years his life may be said to have been devoted to the service of his country. His first election to Congress was in 1806, but it was only for the remaining portion of a term; and in 1807 he was again elected to the General Assembly of Kentucky, of which he was chosen speaker; an office he held till he was in 1809 elected for an unexpired term of two years to the senate of the United States. In 1811 he was sent as a representative to Congress, and on the meeting of the House of Representatives he received the very remarkable honour of being elected speaker, though he was now for the first time a member of the house. But his speeches in the senate, and his conduct as speaker of the Kentucky Assembly, had established his reputation; and so well satisfied were the members with their choice, that he was five times re-elected speaker. During this period he took a prominent part in the great questions of the day, but especially distinguished himself by his earnest denunciations of the English claims to right of search and other maritime prerogatives; and as he was one of the prime instigators to the war with England, so during its continuance he remained one of its strongest advocates. He was in 1814 appointed, avowedly in consequence of the leading part he had taken in the discussions on the war, one of the commissioners to negotiate the treaty of peace; and for him is claimed the credit of having by his adroitness obtained for America some advantageous concessions. In France he was treated with much distinction, and on his return to America he was at once re-elected to Congress.

He now directed his energies to home legislation; but when the question of South American independence was mooted, Clay eagerly urged its immediate recognition: he was already promulgating his favourite idea of the eradication of every species of European authority from the American continent. While engaged in a decided course of opposition to the general policy of President Monroe, there were two great measures which specially occupied his mind. One was the establishment of a national system of internal improvements, which the president opposed as unconstitutional, but which Clay successfully vindicated from that objection; the other was the return to a modified protective system. Both of these measures were carried, and the successful issue of his exertions placed Clay in the estimation of a large portion of his countrymen in the very first rank of American statesmen. He was now looked to by many as the probable successor to the presidential chair, and it was well understood that he himself coveted that elevated post. That he might be in a better position to bear the increased expenditure its acceptance would necessarily entail, he resigned in 1819 his seat in Congress and returned to the active pursuit of his profession, in which he promptly regained a highly lucrative practice. But when the conventions began to consider the claims of the candidates for the presidency, it was apparent that Clay would not be chosen; his name was therefore withdrawn, and he returned in 1823 to the House of Representatives, by whom he was immediately restored to his place as speaker. Three candidates went to the vote for the presidency, but as neither could obtain the absolute majority required by law, the election lay ultimately in Congress, and there Clay exerted all his influence in favour of Adams, who was chosen; and he in return appointed Clay secretary of state. This office he held until 1827, and during his occupancy of it discharged its duties with marked diligence and vigour. The independence of the republics of Central as well as South America was promptly recognised by him, and he exerted every nerve to further the dogma of the annihilation of European influence in American affairs. His conduct as secretary was the subject of virulent attacks by his political opponents; and on one occasion he was provoked to challenge Mr. Randolph on account of some strong remarks in the House of Representatives: happily neither of the combatants was injured. Clay had many years before, when speaker of the Kentucky House of Assembly, challenged and fought a political opponent who had expressed himself with too much freedom in a debate.

On the election of General Jackson in 1829, Clay retired for awhile into private life, but in 1831 he was elected to the United States senate. In 1833 Clay was again an unsuccessful candidate for the presidency. He had now to renew the struggle for his protective tariff. The entire subject was re-opened, and the country was agitated from end to end. South and north were almost in open conflict. At length Clay brought forth his 'Compromise bill': it was accepted by both parties, and modified protection to national interests became the established law of the United States. His subsequent tour through the middle and eastern states was a continued triumph. Passed over at the presidential election of 1836, at that of 1839 his claims were again put forward; but though his party was now in the ascendancy, at their convention he was set aside by them for General Harrison, who was accordingly elected. Clay remained a member of the senate till 1842, when, finding that his strength was insufficient to sustain

him in his arduous course of self-imposed labour, and vexed at President Tyler successively vetoing measures which he had succeeded in persuading Congress to adopt, he took a formal leave of the scene of his prolonged labours and triumphs in a speech which produced a powerful impression on the senate and on the country. It was generally felt that the veteran statesman had scarcely been treated by his countrymen as his long and on the whole unquestionably popular course of public service deserved. It was acknowledged by his party that in their presidential conventions the honourable claims of their really great man had been set aside, and the coveted honour bestowed on obscure mediocrity. 'Justice to Clay' was adopted as a rallying cry, and in the election of 1844 he was put in nomination and supported by the full strength of his party. But this time the majority was on the other side, and Polk was elected. Clay remained in retirement till 1849, when he was again returned to the senate. To him was due the famous slavery 'Compromise Act' of 1850, which for a brief space quieted the bitter strife which the question of slavery had kindled in the union. But it only for the moment allayed the storm; and Clay lived long enough to perceive that as a permanent measure his project was a failure. He had laboured beyond his strength in endeavouring to reconcile the irreconcilable, and now he longed only for rest. But his was not to be a rest on earth. He resigned his office as senator, but before the day named for his resignation to take effect, he had ceased to live. He died June 29, 1852, aged seventy-five. He was buried with unusual pomp. In the chief towns of Kentucky every external honour was paid to his memory. At New York business was suspended in the city, the shops were closed, and the shipping carried their flags half-mast high during the day. Henry Clay was undoubtedly a man of powerful intellect, but he will hardly retain the rank which his contemporaries too readily assigned him. He was wanting in comprehensiveness. His views were at best too strictly national, and, as in the case of the protective tariff, and in his general foreign policy, he too readily took for granted that what seemed to give an advantage to his countrymen was really for their benefit in the large view of things. As an advocate he had few rivals; his legal learning was but small. Clay was in a word a thoroughly able politician; he is not likely to take permanent rank among the great statesmen of America.

CLAYTON, ROBERT, Bishop of Clogher, was born at Dublin in 1695, and educated at Westminster School and Trinity College, Dublin. He was successively appointed to the sees of Killala, Cork, and Clogher (holding the two latter together), although his orthodoxy seems to have been very doubtful from his first entrance into the Church. His preferment was owing to a lady who was connected with his family by marriage—Mrs. Clayton, afterwards Lady Sundon, who was one of Queen Caroline's chamber-women: his shameless eagerness for preferment, the intensely selfish worldly character of the man, and the degrading condition of ecclesiastical affairs at that period, are made painfully evident in the correspondence published in the so-called 'Memoirs of Viscountess Sundon,' 2 vols., 1847. Clayton's first published work was 'An Introduction to the History of the Jews.' This was followed by 'The Chronology of the Hebrew Bible vindicated,' published in 1747; 'A Dissertation on Prophecy,' in 1749; and 'An Essay on Spirit,' 1751: this essay, which was full of the notions contained in what is called the Arian heresy, gave great offence to the Church, and prevented his being promoted to the archbishopric of Tuam. There is some doubt whether Clayton was really the author of it, but he soon avowed all the sentiments which it contained, and even more, in his 'Vindication of the Old and New Testament, in answer to the Objections of the late Lord Bolingbroke, in Two Letters to a Young Nobleman,' which was published at different periods in three separate parts.

On the 2nd of February 1756, he made a motion in the Irish House of Lords for the expunging of both the Athanasian and Nicæan creeds from the Liturgy. The motion, which did not find a single supporter in the House, created a violent storm at court and out of doors; and when he renewed his attack in the following year, in the third part of his 'Vindication of the Old and New Testament,' &c., it burst upon his head. The king instructed the lord-lieutenant to bring on a legal prosecution of the bishop, but before the day fixed for the opening of the proceedings he was carried off by a nervous fever. He died February 26, 1758. Besides the works already mentioned, Bishop Clayton published 'A Journey to Mount Sinai and back again,' from a manuscript written by the Prefect of Egypt, in company with the missionaries of the Propaganda; to which are added some 'Remarks on the Origin of Hieroglyphics, and the Mythology of the Ancient Egyptians.' His writings are poor in substance, weak in thought, clumsy in structure, and if they ever had any value it has long since passed away. Clayton bore the character of being a generous and benevolent man, and his charities were frequently well directed.

CLEANTHES (Κλεάνθης) was the successor of Zeno of Citium in the Stoic school, and was himself succeeded by his pupil Chrysippus. As Zeno died in B.C. 263 or 259, the period of Cleanthes is approximately determined by that fact. [ZENO of Citium.] Cleanthes was a native of Assus in the Troas, and originally a boxer. He came to Athens with four drachms (about 3s.) in his pocket, and began to attend the lectures of Zeno. As he had to pay his teacher a small fee, and at the same time to gain his livelihood, he used to draw water for

the gardens about Athens in the night, and also grind corn. There is a story that he was brought before the Areopagus in order to show what his means of subsistence were, and he proved that he was an honest man by producing as witnesses the gardener and the mealman for whom he worked, whereupon the Areopagus voted him a present of ten minæ, which however Zeno would not allow him to receive. Ten minæ seems rather a large sum for the Areopagus to vote on such occasion; and it is not said whether they had a fund for remunerating persons who were brought before them on groundless charges. Cleanthes attended the lessons of Zeno for nineteen years. He was slow of comprehension, but very laborious, whence he got the name of the second Hercules. Though he did not learn quick, he kept what he got. He was a copious writer: a list of his numerous treatises is preserved by Diogenes Laertius. Nothing is known of his works, except that we may collect that he indulged in the subtleties of discussion; but it does not appear that he did much towards the extension or improvement of the Stoic doctrines: that was done by his pupil Chrysippus. But the stern character of Cleanthes was well adapted to give stability to the doctrines of Zeno. The story of his death is characteristic. He had a swelling in his jaw, and at the advice of physicians he abstained from food, and the complaint began to abate. The physicians told him that he might now take his usual food, but he remarked that he had already gone a good part of the journey, and so he continued fasting till he died, at the age of eighty, or of ninety-nine, according to Lucian and Valerius Maximus.

Cleanthes is the author of a hymn to Jupiter in Greek hexameters, which was first published by Fulvius Ursinus, at the end of the 'Fragments of the Nine Illustrious Women and of the Lyric Poets,' Antwerp, 1568, 8vo. It is printed in Cudworth's 'Intellectual System,' with a Latin poetical version by Dupont. The last edition is by Coraas, in his edition of the 'Enchiridion of Epictetus,' Paris 1826, 8vo.

The hymn of Cleanthes has always been a favourite with Christian philosophers; but the true understanding of it, as Ritter remarks, can only be reached by looking at it from the Stoical point of view.

(Diogenes Laertius, *Cleanthes*; Fabricius, *Biblioth. Græc.*, iii. 550; Ritter, *Geschichte der Philosophie*, iii. 521.)

CLEISTHENES, an Athenian, one of the family of the Alcmæonidae, was grandson of Cleisthenes, the tyrant of Sicily. After the expulsion of the Pisistratidae (B.C. 510) he changed his line of politics, and headed the democratical party: the opposite faction was conducted by Isagoras. Cleisthenes soon obtained the favour of the people, and the sanction of an oracle from Delphi enabled him to effect changes in the constitution of Attica which were productive of very important results. The four tribes into which Attica had anciently been distributed gave place to a division altogether new. He made ten tribes, called severally from the name of some hero: each tribe contained a given number of demi (*δῆμοι*), or townships, which were under the direction each of a demarch (township-governor). Every citizen was obliged to have his name enrolled in the register of some township. Many other changes were also effected. The senate was increased from 400 to 500; 50 were sent by each tribe. The process of ostracism is said to have been first formally established by Cleisthenes. The Spartan king Cleomenes, acting on the suggestions of Isagoras, insisted on the expulsion of Cleisthenes and the accused persons. (Herod., v. 70.) Cleisthenes left Athens (Herod., v. 72), but waited a favourable opportunity for prosecuting his schemes. Seven hundred families were banished at the same time. (Herod., v. 72.) When Cleomenes and Isagoras were besieged in the citadel which they had occupied, and were forced to capitulate, they left Athens with the Spartan troops, and Cleisthenes, with the seven hundred families, returned in triumph. (Thirlwall, *Greece*, vol. ii. pp. 73-80; Niebuhr, *Rome*, vol. ii. p. 395, &c., Eng. transl.)

CLEMENCE, ISAURE, a French poetess, born near Toulouse, but at what time has been a matter of much dispute. The first known writer who spoke of her is Guillaume Benoit, a jurist of the fifteenth century, who says that she instituted the floral games, "jeux floraux," at Toulouse, which were held yearly on the 1st of May, and that she instituted prizes for those who distinguished themselves in various kinds of poetry. The prizes were a gold violet, a silver eglantine, and a gold souci or marigold. This distribution of prizes continued till the Revolution. The capitouls or echevins of Toulouse distributed the prizes, on which occasion an eulogium was recited in memory of Clemence Isaure, and her statue in the Hôtel de Ville was crowned with flowers. In 1527, Etienne Dolet, a writer and printer at Lyon, who was hanged and burnt for heresy in 1546, wrote an eulogium of Clemence in Latin verse, with the title, 'De Muliere quidam que Ludos literarios Tolose constituit.' These writers were followed by numerous others, and among them De Thou and the President Berthier, who wrote about Clemence, and placed her existence in the 14th century. Catel however in his 'Mémoires du Languedoc,' expressed doubts on the subject, and treated the existence of Clemence as fabulous. Dom Vaissette, 'Histoire du Languedoc,' supports the personality of Clemence, and her foundation of the prizes, as proved by tradition, instruments, and public documents in the Hôtel de Ville of Toulouse. In 1775 a Memoir appeared, in which Clemence Isaure is stated to have lived in the latter half of the 15th century. This controversy seems to have originated in having attributed to Clemence

Isaure the original foundation of the poetical academy known by the name of the floral games. But that academy was founded long before Isaure by the troubadours, and was called the college of 'la gaie science,' or 'gai savoir.' The first authenticated meeting on record dates from the year 1323; they then assembled in a garden outside of Toulouse. The registers of this college, till about 1500, make no mention of Isaure. It may be about this latter period that she founded the prizes of gold and silver flowers, from which the academy took its more recent name. A quarto black letter volume of short poetic pieces was published at Toulouse in 1505, entitled 'Dictas de Dona Clemensa Isaure.' The accounts of Isaure's life and adventures which are found in several compilations appear very problematic. (*Encyclopédie Méthodique, Histoire*, art. 'Isaure'; Moreri, *Nouv. Biog. Gen.*; Noullet, *de Dame Clémence Isaure, substituée à M. D. la Vierge Marie*, Toulouse, 1852.)

CLEMENCIN, DIEGO, a patriotic Spanish statesman, and an author distinguished for the purity of his Castilian style, was, according to his opponent, Puigblanch, the son of a Frenchman. He was born in the city of Murcia on the 27th of September 1765, entered the college of San Fulgencio in that city at the age of nine, distinguished himself so much that he was engaged to draw up a plan for the reform of the studies of the college while he was yet a pupil, and was appointed professor of theology and philosophy before he was twenty-one. He gave up the church, for which he was intended, and in which a brilliant prospect was opening before him, from attachment to a lady, whom he married in 1798, after an engagement of ten years, and with whom he lived happily for upwards of thirty. The Duke of Osuna made him tutor to his children, and while he held the post he arranged the duke's magnificent library, which was afterwards thrown open to the public. The favourite, Godoy, to whom the duke was obnoxious, drove him into an honourable banishment by appointing him ambassador first to St. Petersburg and then to Vienna; but his diplomatic duties never carried him further than Paris, where Clemencin, who accompanied him, made good use of the libraries of the capital. On his return to Madrid in 1801 he was appointed member of the Academy of History, and for the remainder of his life continued in honourable connection with that body, of which he was for a long time the secretary. In July 1807 he read before it his 'elogio,' or eulogy on Queen Isabella the Catholic, the patroness of Columbus, which was first printed by the academy in 1821, so long was the course of literature and study in Spain interrupted by revolution and war. Of these calamities Clemencin had his full share. Early in 1807 he had been appointed editor of the official 'Gazette' of Madrid, as well as of the 'Mercurio,' formerly conducted by Clavijo. [CLAVIJO.] The day after the patriotic insurrection of the 2nd of May 1808, the first outbreak of the great Peninsular war, which was suppressed for the moment with violence by the French, who then had military possession of Madrid, Murat, their commander, sent for Clemencin, and demanded of him how he came to insert in the 'Gaceta' an article which had appeared just before the outbreak, in which he contradicted, and with truth, an article in some of the French journals respecting Ferdinand of Spain, then a prisoner at Valençay. Clemencin replied, that he printed nothing without an authorisation from the Spanish government. "Very well," replied Murat, "then unless the order for the insertion of that article is produced within an hour you shall be shot." The threat would doubtless have been carried into effect, but that the official who had transmitted the order, who was Cienfuegos, a poet of some note, was found within the prescribed time by the French soldiers sent in search of him, and brought from his bed, where he lay ill, to Murat, who sent him prisoner to France, where he died in the course of the following year from grief and indignation. Clemencin, who joined the cause of the patriots, was first engaged in editing a journal for the junta of Aragon, then as member of the Cortes of Cadiz, besieged by the French and assailed by the yellow fever, in drawing up and supporting the constitution of 1812. The absolutist reaction on Ferdinand's return in 1814, sent him to a country retirement at Fuenfria, a place to which he was much attached, and where, when the times were against him, he was accustomed to devote himself to literary pursuits amid the pleasures of the country. In the second constitutional outburst of 1820, Clemencin was again deputy for Murcia, and first secretary, then president of the Cortes, in which capacity, as also in that of minister, he found it necessary to address some strong language to King Ferdinand. Such however was the general respect for his high character and his literary acquirements, that on the second reaction of 1823 he was only banished from Madrid, and in 1827 obtained permission to return, after four years of his favourite Fuenfria. The third constitutional period of Spain raised him higher in honours than ever; but they came too late—he had lost his wife. He was appointed to draw up the oath to be taken by the present queen, was named principal librarian to her majesty, and also a 'procer del reyno,' or peer of the kingdom. He was also appointed to the somewhat less desirable office of censor of the press, pursuant to the new decree on the press of the date of the 2nd of May 1833. He died of cholera, on the 30th of July 1834, at Madrid.

During all this active and stormy life Clemencin had found leisure for many literary undertakings, as well as for numerous labours of philanthropy, having as early as 1804 taken a prominent part as a

member of the association of the 'Buen Pastor,' or 'Good Shepherd,' for the amelioration of the Spanish prisons. Among his early works are translations of portions of scripture and of the classics, the Epistles of St. John, the Germania of Tacitus, &c.; his later are chiefly on subjects of Spanish history. His 'Eulogy on Queen Isabella,' with its annexed dissertations, was the first important work on the subject, and though partly superseded by the better-known history of Prescott, is one of which it would still be desirable to see a translation in English. A French translation by Amanton which appeared at Paris in 1847 is of the 'Eulogy' only without the Dissertations, and thus conveys a very erroneous notion both of the merits and the magnitude of the original, which occupies the whole sixth volume of the 'Memoirs of the Spanish Academy of History,' the 'Eulogy' taking up fifty-four pages, and the 'Dissertations,' twenty-one in number, upwards of 500. During one of his compelled retirements to Fuenfria, Clemencin composed his great work, the 'Commentary on Don Quixote,' first published along with the text of the novel in six quarto volumes, Madrid, 1833-39, of which only the first three saw the light during the author's lifetime. Ticknor in his 'History of Spanish Literature' describes it as one of the best commentaries on any author ancient or modern. The English reader will perhaps be disposed to find fault with what the Spanish biographer Alvarez terms the "admirable prolixity" of the commentator, who thinks it necessary to relate the story of Orpheus, the Thracian musician, as well as that of Roque Guinart, the Catalan robber; but almost the only fault to be found with the commentary, which exceeds the text in volume, is that it gives too much. It is matter of surprise that nearly twenty years should have elapsed from the date of its publication without its having been made available to the English admirers of Cervantes. [SAAVEDRA.] Clemencin also composed a dissertation on the 'History of the Cid,' another on the 'Geography of Mediaeval Spain, &c.,' and was one of the committee appointed by the Spanish Academy for the reformation of Spanish orthography, who proposed the system now generally adopted. His 'Lecciones de Gramatica y Ortografia Castellana' were first published after his death in 1842.

CLEMENS, TITUS FLAVIUS ALEXANDRINUS, was born about the middle of the 2nd century of our era. According to St. Epiphanius he was an Athenian, and at first a follower of the Stoic philosophy; but according to others he belonged to the Platonic school, an opinion which seems countenanced by the manner in which he speaks of Plato and his philosophy in many passages of his writings. He says in his 'Stromateis' (lib. i.), that "he had for teachers several learned and excellent men; one an Ionian, who lived in Greece, another from Magna Græcia, a third from Colosyria, a fourth from Egypt, and others who had received the Christian doctrine in the East, of whom one was from Assyria, and the other from Palestine, of an ancient Hebrew family; but that at last he found in Egypt one superior to all, with whom he remained." This was Pantemus, whom he repeatedly mentions in his works, and who kept a Christian school at Alexandria, in which capacity Clemens succeeded him. St. Jerome says that Clemens was teacher of the catechumeni in that city. He was ordained presbyter of the church of Alexandria, where he appears to have remained the rest of his life. His death is believed to have happened about A.D. 220. Among his disciples were Origen, and Alexander, afterwards bishop of Jerusalem.

Clemens left many works, in which he has mixed with the precepts of the Christian doctrine and morality, which it was his object to inculcate, much information concerning the learning, philosophy, history, and manners of the heathens. Of the earlier Christian writers, he is the most conversant with the science and learning, with the opinions and practices, of the various nations of that day; and his works are extremely interesting, as showing the state of society, both among Heathen and Christian subjects of the Roman empire at that early time. They also contain much information on ancient history, chronology, and the various schools of philosophy; many extracts from ancient writers, whose works are lost; and also accounts of the early heresies and schisms which divided the primitive Christian church. The works of Clemens which have come down to us are:—1. 'Exhortation to the Greeks,' 1 book. This is an exhortation addressed to the heathens to abandon their false gods, whose absurd stories and obscene adventures he exposes by the testimony of the poets and philosophers of antiquity. 2. 'Pedagogus,' in 3 books. This is a treatise on Christian education. His satire of the vices and follies of the age is caustic and humorous, and reminds us at times of Juvenal. When we reflect that he lived under the reigns of Caracalla and Heliogabalus, we do not feel inclined to suspect him of exaggeration. 3. 'Stromateis,' in 8 books. The word stromateis he has used to mean a party-coloured or patch-work; "opus varie contextum," from the multifarious kind of information, religious and profane, anecdotal, historical, and didactic, put together without much regard to order or plan. Clemens says that he adopted this want of arrangement "to veil the doctrines of Christianity under the maxims of profane philosophy, in order to screen them from the eyes of the curious and the uninitiated, that those only who are intelligent and will give themselves the trouble of studying, may understand the meaning." Probably also he found this style of composition better adapted for his multifarious information, and best suited to his old age, in which

he apparently wrote it. In the first book he descants upon the utility of philosophy, and concludes by asserting, by the help of chronology and quotations, that the philosophy contained in the sacred books of the Hebrews was the most ancient, and that other nations had borrowed much from it. In the second he treats of faith, sin, and repentance; he asserts the free will of man, condemns licentiousness, commends lawful marriage with one wife and one alone. In the third he continues the preceding subject, condemns the incontinence of the Nicolaites, Valentinians, and other early heretics, and whilst speaking with great praise of virginity, defends marriage against the Marcionites. He says the apostles Peter and Philip were married and had children. In the fourth book he treats of Christian perfection and martyrdom, exhorting the Christians to submit to death for the love of God and of Christ. Perfection he places in the precept of loving God and our fellow-creatures. In the fifth he shows that the method of speaking by figures and symbols is very ancient, both among the Hebrews and the Greeks; the Greeks, he says, borrowed most of the truths they have written from those whom they called barbarians, and especially from the Jews. This book is full of quotations from ancient poets and other writers. In the sixth and seventh books he sketches the portrait of a true Gnostic, a term which with him is synonymous with that of a perfect Christian. It is a complete model of moral conduct. He combats the reproach of the Greeks about the divisions and schisms existing among the Christians. He says that schisms will arise in any community; that they were foretold by Christ; that they had existed among the heathens and the Jews; that the way to ascertain the truth is to consult the Scriptures, and the whole Scriptures, and not merely some parts of them, and to follow the tradition of the church; that there is only one universal church, older than all heresies, that it began under Tiberius, and was promulgated all over the world under Nero, while the older heresies date only from the reign of Hadrian. He then recapitulates the subject of his seven books, and promises to begin the next by a new subject. The eighth book, as we have it in our editions, differs altogether from the rest, being a treatise on logic. Photius, in his 'Bibliotheca,' says, that in some editions in his time the eighth book of the 'Stromateis' consisted of the treatise 'Can a rich man be saved?' which however is generally placed as a distinct work, after the eight books of the 'Stromateis.' This treatise has also been published separately, with a copious and learned commentary by a professor of Utrecht. 'Clementis Alexandrini liber: Quis dives salutem consequi possit, perpetuo Commentario illustratus a C. Seegario,' 1816. Among the works of Clemens which are lost was the 'Hypotyposesis,' or Commentaries on various parts of the Scriptures, in eight books, mentioned by Photius, who quotes several passages, and severely condemns it as heretical. (Photius among the 'Testimonia,' at the beginning of Clemens' works, Potter's edition.) This seems rather strange, as the other works of Clemens have been esteemed perfectly orthodox, and greatly commended by Eusebius, Jerome, and other ancient fathers, with the exception perhaps of one or two obscure passages concerning the nature of Christ and original sin. The errors however ascribed to the 'Hypotyposesis,' may be accounted for in some manner by the supposition that it was an earlier work of Clemens, written before he was properly instructed in the Christian doctrines, and while he was still much imbued with his Platonic philosophy. Upon the whole Clemens is more of a Christian philosopher and moralist, than a professor of dogmatic theology. Some believe that the 'Excerpta ex Scriptis Theodoti et Doctrina quæ Orientalis vocatur,' which appear at the end of Clemens' works as well as some other fragments, are extracts from his 'Hypotyposesis.' He also wrote several treatises, 'De Pascha,' 'De Jejunio,' 'De Obsecratione,' &c., which are lost. Clemens' works were published, with a Latin translation, by J. Potter, 2 vols. folio, Oxford, 1715; and also at Würzburg, 3 vols. 8vo, 1780. There are several other editions of the whole or of separate works: the latest perhaps is that of Caillean, vol. iv. of the 'Collectio selecta SS. Eccl. Patrum,' Paris, 1827.

CLEMENT I., or CLEMENS ROMANUS, succeeded Anacletus as Bishop of Rome in the latter part of the first century of our era. The chronology of the early bishops of Rome has been the subject of much controversy. One of the earliest authorities, Irenæus, bishop of Lyon, who lived in the latter part of the 2nd century, says that "when the blessed apostles, Peter and Paul, had founded and established the church at Rome, they delivered the office of the bishopric in it to Linus. To him succeeded Anacletus, after whom, in the third place after the apostles, Clement obtained that bishopric, who had seen the blessed apostles, and conversed with them; who had the preaching of the apostles still sounding in his ears, and their traditions before his eyes. Nor he alone, for there were still many alive who had been taught by the apostles. In the time therefore of this Clement, when there was no small dissension among the brethren at Corinth, the church at Rome sent a most excellent letter to the Corinthians, persuading them to peace among themselves," &c. This is the epistle which is ascribed to Clemens Romanus, by Clemens Alexandrinus, Origen, Eusebius, Jerome, and other ancient fathers, as having been written by him in the name of the Church of Rome to that of Corinth, and which was often read in the time of Eusebius in the churches, after the gospels, on account of the excellent precepts which it contains. Eusebius ('Hist. Eccl.' iii. 13) says that Clement succeeded Anacletus, or Anacletus, in the twelfth year of Domitian (A.D. 92), and that he

died in the third year of Trajan (A.D. 100), having been bishop nine years. After mentioning his epistle to the Corinthians, Eusebius says that another epistle was also ascribed to him by some, but was not generally received as genuine; and that "there had been published not long since other large and prolix works in his name, containing dialogues of Peter and Apion, of which the ancients had not made the least mention." Eusebius wrote at the beginning of the 4th century; and Jerome, who lived half a century later, repeats and confirms the remark of Eusebius. The first epistle of Clement, which was written in the name of the Church at Rome to that of Corinth, 'Dei Ecclesie quæ Romæ peregrinatur Ecclesie Dei quæ Corinthi peregrinatur,' and was occasioned by a schism which had broken out at Corinth among the Christians, is full of sound and charitable advice. It consists of fifty-nine chapters, and is one of the most interesting memorials of the primitive church. The second epistle, supposed also to be Clement's, is only a fragment, containing likewise moral and religious advice; but it breaks off abruptly in the middle of the twelfth chapter, and there is no evidence of its being written to the Corinthians. It is thought by Neander to be rather a portion of a sermon than of an epistle. Whether it is by Clement or some subsequent writer is uncertain. Both epistles were found at the end of the New Testament in a manuscript brought from Alexandria, and were published by Patrick Junius, 'Sancti Clementis Romani ad Corinthios Epistolæ duæ expressæ ad fidem MS. Cod. Alexandrini,' Oxford, 1683; and again by H. Wootton, Cambridge, 1718. A long account of Clement's life, pilgrimages, and martyrdom, has been made out by Gregory of Tours, Nicephorus, and others, entitled 'Acta S. Clementis,' and adopted by Baronius; but it is considered doubtful even by most orthodox Roman Catholics. It is not quite certain that Clement suffered martyrdom. He is said by some to have been exiled from Rome, and to have died in the Chersonesus Taurica; but this is also contested by others, and apparently with sufficient reason. Clement was succeeded in the see of Rome by Evaristus. Several other works have been attributed to Clement which are evidently apocryphal, such as eight books of Institutions or Constitutions, &c. (Tillemont, 'Mémoires pour l'Histoire de l'Eglise,' vol. ii.; Du Pin, 'Bibl. des Auteurs Eccles.,' Neander, 'Geneetische Entwicklung,' &c.) Wetstein published two more epistles attributed to Clement, which he found at the end of a Syriac version of the New Testament: they are chiefly in praise of virginity, and are regarded as spurious. The 'Epistles of Clement' have been frequently reprinted. Perhaps the most convenient recent edition is that of Hefele, reprinted in England with an introduction by A. Grenfell, M.A., 1841.

One of the oldest churches at Rome on the Cælian Mount is dedicated to St. Clement; but it is not quite certain whether it was built in honour of the bishop, or of FLAVIUS CLEMENT, the martyr, with whom the other has been often confounded. Flavius Clement was cousin to Domitian, and his colleague in the consulship (A.D. 95), and was put to death by order of that emperor on a charge of impiety towards the gods, which is understood to mean that he belonged to the Christian communion. His wife, Domitilla, was exiled on the same charge to Pandataria. Flavius Clemens is numbered among the martyrs by the earliest ecclesiastical historians. The old church, which is believed to have been built in the 5th century, fell to ruins, and was taken down by Adrian I. towards the end of the 8th century, and rebuilt by Nicholas I. in the 9th. In the year 1725, Cardinal Annibale Albani having made excavations under the great altar of St. Clement's, found a tomb with an inscription to Flavius Clemens, martyr. A full account of it, with a dissertation, was published: 'Tit. Flavii Clementis Viri Consularis et Martyris Tumulus illustratus,' Urbino, 1727.

CLEMENT II. (Suidger, bishop of Bamberg), succeeded Gregory VI. in the papal chair in 1046, and after crowning the emperor, Henry III., died October 7, 1047, and was succeeded first by Benedict IX., who had been previously deposed by the council of Satri, and who was again obliged to abdicate; and lastly by Damasus II.

CLEMENT III., a native of Rome, succeeded Gregory VIII. in 1188. He summoned a crusade against the Saracens, in which the emperor, Frederick I., Richard of England, and Philip of France embarked. He died after little more than three years' pontificate in March 1191. He was succeeded by Celestine III.

There was also an antipope, or competitor, of the celebrated Gregory VII., who assumed the name of Clement III. from 1080 to 1101, but he is not numbered among the legitimate popes.

CLEMENT IV., a native of St. Gilles, in Languedoc, succeeded Urban IV. in 1265. He showed the same inflexible hostility as his predecessor against the Suabian dynasty of Naples, and assisted Charles of Anjou in the conquest of that kingdom, which was accomplished by the defeat and death of Manfred at the battle of La Gran-della, near Benevento. Charles in return acknowledged himself as his coronation as feudatory of the see of Rome, and agreed to pay tribute. Conradin, Manfred's nephew, having attempted to recover his hereditary kingdom, was defeated by Charles at Tagliacozzo, and beheaded in the market-place at Naples, with the approbation of Clement, as it was reported. A month after Conradin's execution, Clement himself died, in November 1268. His death was followed by an interregnum of about two years, after which the cardinals elected Gregory X.

CLEMENT V., a Frenchman, and Archbishop of Bordeaux, suc-

ceeded Benedict XI. in 1305, by the influence of Philip le Bel, who induced him to remove the papal residence to France. Clement joined Philip in suppressing the order of the Templars, and in condemning the grand master and sixty knights to be burnt alive. Clement died in April 1314, and was succeeded, after a two years' interregnum, by John XXII. His decretals and constitutions were collected and published in 1308, under the title of 'Liber septimus Decretalium,' being the seventh book in order of time of the decisions and rescripts of the popes on matters of ecclesiastical discipline, and on matters concerning laymen, which then came within the cognisance of the ecclesiastical courts. They are known as the 'Clementines.'

CLEMENT VI., a Frenchman, succeeded Benedict XII. in 1342. He resided at Avignon like his immediate predecessors, and it was under his pontificate that Rienzi made the attempt to re-establish the republic at Rome. [RIENZI.] Clement took the part of Joanna I., queen of Naples, against her brother-in-law, Lewis of Hungary, who had invaded her dominions to avenge the murder of her husband. Joanna, on her part, sold or gave away to the papal see the town and county of Avignon, which belonged to her as sovereign of Provence. Clement fixed the jubilee to be held at Rome every fifty years. He died in 1352, and was succeeded by Innocent VI.

CLEMENT VII. (Giulio de' Medici, the natural son of Giuliano de' Medici, and nephew to Lorenzo the Magnificent), was made cardinal by his cousin, Leo X., and was afterwards promoted, in 1523, to the papal chair, then vacant by the death of Adrian VI. His pontificate was full of vicissitudes and calamities to Italy. He first allied himself with Francis I. against Charles V., in order to prevent the latter possessing himself of all Italy; but he only hastened the progress of the imperial arms, and saw his own capital, Rome, stormed and cruelly pillaged by the army of Charles, and himself besieged in the Castle Sant' Angelo. He afterwards made peace with the emperor, and united with him to destroy the independence of Florence, his native country. Clement's quarrel with Henry VIII. of England, which arose from his refusing the bull of divorce between that king and Catharine of Aragon, led to the schism between Henry and Rome. He died in 1534 after a long illness, leaving behind him a character stained by avarice, harshness, and deception: he had most of the failings, but none of the splendid or amiable qualities of his cousin, Leo X. He was succeeded by Paul III.

There was also an antipope in the 14th century, who was elected by a party among the cardinals in opposition to Urban VI., and who assumed the name of Clement VII. [URBAN VI.; BENEDICT, antipope.]

CLEMENT VIII. (Ippolito Aldobrandini), succeeded Innocent IX. in 1592. He was a man of learning, and of considerable political sagacity. He succeeded in the negotiations with Henri IV. of France, by which that prince made public profession of Catholicism, and was acknowledged king by his subjects. Clement annexed, by force, the duchy of Ferrara to the papal state after the death of Duke Alfonso II., disregarding the claims of the duke's cousin, Cesare d'Este, who was obliged to yield, and retire to Modena. Clement died in February 1605, and was succeeded by Leo XI. He published a new edition of the 'Vulgate,' differing in some particulars from that published under Sixtus V. in 1590. He also issued many bulls, the most remarkable of which are the 28th, defining the lawful and unlawful rites and usages of the Greek Church, and the 87th, concerning the practice of confession and absolution in writing.

CLEMENT IX. (Giulio Rospigliosi), of a noble family of Pistoia, succeeded Alexander VII. in June 1667. He showed a conciliatory spirit, hushed for awhile the controversy between the Jansenists and the Jesuits [ARNAULD], and settled the long-pending dispute between the see of Rome and the king of Portugal, on the right of nomination to the vacant bishoprics, by confirming the prelates appointed by King Pedro II. He took a warm interest in the war between Venice and the Turks, and sent assistance of men and money to the Venetians for the defence of Dalmatia and of Candia. The news of the loss of that island, which was finally conquered by the Turks in 1669, is said to have hastened the death of Clement, which occurred in December of that year. He was much regretted by his subjects as well as by foreign princes. He embellished Rome, and was magnificent in his expenditure. His nephew was made a Roman prince, and married the heiress of the house of Pallavicini of Genoa.

CLEMENT X. (Emilio Altieri), was eighty years of age at the time of his election as successor to Clement IX. in 1670. He entrusted the affairs of the administration chiefly to Cardinal Paluzzi, a distant relative, whom he adopted as his nephew, and gave him his family name of Altieri, as he had no nearer relations living. He died in 1676, and was succeeded by Innocent XI.

CLEMENT XI. (Gian Francesco Albani), succeeded Innocent XII. in November 1700. He was then fifty-one years of age, had been made a cardinal by Alexander VIII., and had a merited reputation for learning and general information. He was one of the men of letters who frequented the society of Christina of Sweden during her residence at Rome. It was with seeming repugnance, and after several days' hesitation, that he accepted the papal dignity. The war of the Spanish succession was then just breaking out, and Clement in vain exerted all his powers of persuasion with the courts of France and of Austria to prevent the impending calamity. Louis XIV., having placed his grand-

son Philip on the throne of Spain, demanded for him of the pope the investiture of the kingdoms of Naples and Sicily, whilst the emperor claimed it likewise as his right. Clement delayed giving his decision, and the intrigues of the agents of the two rival powers disturbed the peace of his own capital. In 1707 the Austrians, under Marshal Daun, traversed the papal state to proceed to the conquest of Naples; and the pope, unable to prevent them, stipulated only that they should not pass through the city of Rome. In the following year the pope came to an open rupture with the emperor, Joseph I., whose troops had taken possession of Comacchio in the papal state. After trying remonstrances in vain, Clement collected an army of 25,000 men, under the command of Count Marsigli; but the papal troops retreated before the Austrians, who occupied Romagna and the Marches, and the pope was obliged to sue for peace, which the emperor granted in January 1709. Comacchio was ultimately restored to the pope.

Clement was tenacious of what he considered as the prerogatives of his see over the clergy of other countries, and he quarrelled in 1715 with the House of Savoy, which then ruled over Sicily, about a tribunal in that island, called di Monarchia, which interfered with the ecclesiastical immunities and the alleged rights of Rome over Naples and Sicily, as fiefs of the papal see. The king, Victor Amadeus II., stood firm; and many of the Sicilian clergy, who refused to obey the directions of the tribunal, were either imprisoned or obliged to emigrate. About 400 of them took refuge at Rome. Clement had also long and serious disputes with France. He began by his bull 'Vineam Domini,' renewing the interdict which his predecessors had issued against the Jansenists, and declaring their propositions about grace and free will to be heretical. In 1718 he issued the famous bull 'Unigenitus,' which set the whole kingdom of France, court, parliament, and clergy in an uproar. This bull condemned 101 propositions of a book by Father Quesnel, entitled 'Moral Reflections on the New Testament;' in which that writer revived several opinions of St. Augustin, St. Prosper, and other old fathers, which sounded favourable to the Jansenistic dogmas of predestination and grace. The Jesuits, who asserted that grace was subordinate to the will of man, and who were accused by the Jansenists of Pelagian heresy, stirred themselves to have Quesnel's book condemned. Several French prelates, Bossuet and Cardinal Noailles among others, approved of the general tenor of Quesnel's book, which contains much sound moral doctrine. Cardinal Noailles had already indisposed the pope against him by presiding at an assembly of the French clergy in 1705, in which the bishops were declared to be judges in matters of doctrine, independent of the pretensions of the pope, who would reduce them to the condition of mere registrars and executors of the papal decrees. Father le Tellier, a Jesuit and confessor to Louis XIV., urged the king in favour of the bull 'Unigenitus,' which was at last registered by the parliament of Paris, after much opposition, and continued for years after to keep up a sort of schism between France and Rome.

Another source of trouble to Clement proceeded from the disputes concerning the Jesuit missionaries in China, who had gained considerable influence at the court of Peking, and were accused by the other missionaries of latitudinarianism, of winking at several superstitious practices in order to make proselytes, and of even countenancing idolatry. Clement sent in 1702 Cardinal de Tournon as legate to China; but the cardinal on arriving at Macao was so worried by the angry controversialists that he died of anxiety and disappointment. Clement afterwards issued a constitution, or series of ordinances, by which he regulated the course to be followed by missionaries in making proselytes; and when that course failed, sent the prelate Mezzabarba as his legate; but the legate was coldly received by the emperor, who was said to be prepossessed against him by the Jesuits, and soon dismissed from the celestial empire.

Clement took a warm interest in the expedition of the Pretender, son of James II., in 1715, and furnished him with money. After the failure of that attempt, the Pretender, being forsaken by France, retired to Italy under the name of the Chevalier de St. George, and Clement appointed the town of Urbino for his residence. He afterwards negotiated his marriage with Clementina Sobieski, which was celebrated at Monte Fiascone, at the pope's expense, who gave to the married couple a palace to reside in, with an annual pension of 12,000 crowns. The court of Rome did not for a long time after give up its favourite scheme of regaining England to Catholicism, by means of the Stuarts.

Clement was more profitably employed in frustrating the schemes of the Turks, who, having invaded the island of Corfu in 1716, were threatening Italy with an invasion. The pope sent a squadron to join the Venetians, he levied a contribution upon the clergy of all Italy to defray the expenses of the war, and he prevailed on the emperor, Charles VI., to join Venice against the Porte. This led to the brilliant campaign of Prince Eugene, who defeated the Turks at Peterwaradin, and took Temeswar. The Turks were also obliged to raise the siege of Corfu.

After the fall of the intriguing Alberoni, in 1710, Clement succeeded in settling his disputes with Philip V. of Spain, and his Nuncio was again received at Madrid. Europe was now at peace, and Clement enjoyed a short period of rest, after a long series of agitations, until March 1721, when he died, after a pontificate of more than twenty years. In his private character he was amiable and generous, and his

morals were irreproachable. He was moderate in providing for his nephews, who owed their elevation more to his successors than to himself. He embellished Rome, and established the Calcozrafia Camerale, which has since given to the world many splendid engravings; he encouraged the art of mosaics, and he introduced at Rome the manufacture of tapestry, on the model of the Gobelins. He added to the Vatican library, and to the museum which is annexed to it; and he patronised men of letters and of science. A fine edition of his decretals, bulls, and constitutions, was published by his nephew, Cardinal Annibale Albani, after his death, 'Bullarium Clementis XI,' 1 vol., fol. He wrote also several Latin homilies, which he recited on solemn festivals, and which were translated into Italian by Crescimbeni.

CLEMENT XII. (Lorenzo Corsini, of Florence) succeeded Benedict XIII. in July 1790. He was then seventy-nine years of age, and infirm. He resumed the old contest with the empire about the reversion of the duchies of Parma and Piacenza, but succeeded no better than his predecessors. He endeavoured, and also in vain, to mediate in the war between the republic of Genoa and the Corsicans. He succeeded better in restoring, in 1740, the little republic of San Marino to its liberties, which had been encroached upon by Cardinal Alberoni. He died soon after, in 1740, and was succeeded by Benedict XIV.

CLEMENT XIII. (Carlo Rezzonico), a native of Venice, succeeded Benedict XIV. in July 1758. He was more distinguished for his piety and private virtues than for political abilities or knowledge of the world. His pontificate was a continual, but on his part ineffectual struggle to uphold the ecclesiastical immunities and the old prerogatives of the see of Rome against the determination of the other powers to be complete masters in their respective countries. He strove hard to support the Jesuits, who had become obnoxious to various courts, and who were suddenly suppressed in Portugal, Spain, France, and Naples. In their distress, most of the expelled fathers sought an asylum in the Papal States, and found in Clement a generous protector. All the remonstrances and threats of France and Spain could not induce him to abolish the order, which he considered as the firmest support of the Roman see. The King of France seized upon Avignon, and the King of Naples upon Benevento; still the pope held firm till his death. The Venetian senate, by a series of decrees passed in September 1768, enforced numerous reforms in ecclesiastical discipline in their own dominions, subjected the clergy to the payment of tithes, suppressed some convents, placed the rest under restrictions with regard to their property and the number of their inmates, and subjected all ecclesiastics to the jurisdiction of the secular courts in temporal matters. Clement strongly remonstrated against these innovations: he threatened excommunication, but the senate persisted in its resolutions. He also came to a rupture with the republic of Genoa, because he had sent an apostolic vicar into Corsica, which was then in a state of revolt against the Genoese. The Elector of Bavaria, about the same time, declared that none but his own subjects should hold benefices within his dominions. Maria Theresa made similar enactments in her own states, and she took away the censorship of books from the ecclesiastical authorities, and gave it to the secular magistrates. Tuscany, Parma, and Naples suppressed convents, and checked the practice of donations and legacies to the church. In the midst of all these blows against the papal authority, Clement died in February 1769. A splendid mausoleum was raised to him by Pius VI. in St. Peter's church, which is much admired, especially for its statue of the pope kneeling at prayers, and the two lions couching at the foot of the monument. It was one of the earlier, and among the best works of Canova, who was employed eight years upon it.

CLEMENT XIV. (Gian Vincenzo Ganganelli) was born at Sant' Angelo in Vado, near Rimini, in 1705. At an early age he entered the order of Franciscans, distinguished himself by his learning, was favourably noticed and employed by Benedict XIV., and was made a cardinal by Clement XIII., whom he succeeded in May 1769, after a stormy conclave, which lasted two months. He adopted a conciliating tone towards the foreign powers, which at the death of his predecessor were on the eve of an open rupture with Rome. He discontinued the public reading of the bull in Cona Domini, which was considered offensive to the sovereigns. The great question which at that time agitated the Roman Catholic world was the definitive abolition of the order of the Jesuits. Ganganelli took several years to decide on this important subject, and at last, on the 21st of July 1773, he issued the bull of suppression. About Easter 1774, Clement was taken dangerously ill, under suspicious symptoms, lingered a few months, and died 22nd of September 1774; but the post mortem examination of his body and the report of the physicians did not countenance the suspicion that he had died of poison. Ganganelli was a man of enlightened mind. He had a taste for the arts; he continued the collection of antique sculptures begun by Lambertini, and ranged them in a suite of rooms in the Vatican, which was called the Clementine Museum, and was afterwards greatly enlarged by his successor, Pius VI., when it received the name of Museo Pio-Clementino. He added also to the Vatican library. A fine monument, the work of Canova, was raised to him in the church of S. Apostoli, which belonged to a convent of his order. The letters published by Caraccioli under the name of Ganganelli are now generally understood to be

apocryphal. Clement XIV. was simple in his habits, free from ambition, and not given to nepotism.

CLEMENTI, MUZZIO, who is justly entitled to rank as the father of the piano-forte school, both as regards composition and performance, was born in 1752, at Rome, where his father practised as an embosser of silver figures and vases for the service of the church. At nine years of age he had made so much progress in music under Cordicelli that he passed a close examination, and was appointed to an organist's place in his native city. He afterwards studied under Santarelli and Carpani, and wrote a mass for four voices when in his thirteenth year. About that time his talents attracted the notice of Mr. Peter Beckford, an English gentleman then travelling in Italy, who undertook the future education of the young artist, and brought him to his seat in Dorsetshire, where the society of a literary and accomplished family inspired him with that taste for the belles-lettres which encouraged him to pursue a course of study that had been well commenced under a member of the Society of Jesus, and to acquire an extensive knowledge of the learned and living languages, as well as of various branches of science. But he steadily pursued the studies proper to the art which he had chosen as his profession; the works of Handel and Sebastian Bach being in particular made the subject of close investigation, while he did not neglect the practice of composition, having, before he had completed his eighteenth year, composed his celebrated Opera 2: "a work which, in the opinion of all good musicians, is the basis on which the whole fabric of modern piano-forte sonatas has been founded."

At the time agreed on by his father, Clementi quitted Mr. Beckford. He shortly after was engaged to preside at the harpsichord at the King's Theatre, and soon was actively and lucratively employed as a master of the first rank. In 1780 he made a tour on the continent, whither his fame had long preceded him, and enjoyed everywhere the highest patronage and the most flattering applause. In Vienna he made the acquaintance of Haydn, Mozart, &c., and played alternately with the latter before the emperor Joseph II. and other royal personages. While in Paris he wrote his Operas 5 and 6; and in Vienna his Operas 7, 8, 9, and 10 were composed. On his return to England he published his Opera 11, and 'Toccata,' as well as his Opera 12. In 1783, J. B. Cramer, who had previously studied under Abel and Schröter, became his pupil, and attended him almost daily.

About the year 1800, having suffered considerably by the failure of the house of Longman and Broderip, he was, by the advice of some eminent mercantile friends, induced to take possession of the premises of those partners, to embark in the music publishing and piano-forte manufacturing business, and become the head of a new firm, from which time he declined all pupils, and devoted himself wholly to his new, important, and successful occupation. But the peace of 1802 tempted him abroad again, and, accompanied by his pupil, Field, he proceeded from city to city till he reached St. Petersburg, where he made some stay. In Berlin he married, and with his bride proceeded to Rome and Naples. He shortly after lost his wife in childbirth of a son, who grew up to be his father's pride and solace, but unhappily lost his life by the accidental discharge of his own pistol. In 1810 Mr. Clementi, after encountering many difficulties in his attempts to reach England during the fiercest period of the renewed war, arrived in London, and shortly after again married. During his last visit to the continent he published his Opera 41, and collected materials for many other works which subsequently appeared, among which his 'Practical Harmony,' in 4 vols., and his 'Gradus ad Parnassum,' in 3 vols. must not be left unnoticed.

In 1813 Mr. Clementi assisted in founding the Philharmonic Society, of which he frequently consented to act as a director, and presented to it his two symphonies, which were more than once performed by that admirable band. Both these symphonies abound in agreeable melody, and are most skillfully written; but the real vigour of the composer's genius is exhibited in his piano-forte works, which are rich and classic in style, and in the purest taste, but are sometimes charged, especially now that a different style is in the ascendant, with a certain want of animation. His sonatas number over 600, divided into 32 operæ; and he wrote also, besides his symphonies, some overtures.

After an illness of no long duration, Mr. Clementi died on the 10th of March 1832. His remains were deposited in the cloisters of Westminster Abbey, and attended to the grave by the choir of that church, of the King's Chapel, and of St. Paul's, together with numerous friends.

CLEOMBROTUS I., brother of Agesipolis, whom he succeeded in B.C. 380 as king of Sparta. In B.C. 378 he marched with an army into Boeotia to attack the Thebans. Passing into the Theban territory he encamped at Cynoscephalæ, and, after remaining there sixteen days, withdrew to Thebes. The purpose of the expedition not requiring his presence longer, he left a third of his forces under Sphodrias, and led back the rest to the Peloponnesus. Two years afterwards, B.C. 376, in consequence of the severe illness of Agesilaus, he was chosen to lead another army against the Thebans. In B.C. 371 he commanded, in the celebrated battle at Leuctra, against Epaminondas. The Lacedæmonian horse were quickly routed and were immediately charged by the Theban phalanx. Cleombrotus was mortally wounded in the attack, and died soon after. (Xenophon, *Hellen.* v. 4, vi. 4.)

CLEOMBROTUS II., son-in-law of Leonidas, on whose expulsion

Cleombrotus was elected king of Sparta, B.C. 243; but on the return of Leonidas, Cleombrotus was sent into exile, his life being spared at the intercession of his wife Cheilonis. Cleombrotus left two sons, the elder of whom, Agesipolis, was the father of Agesipolis III.

CLEOMEDES, a Greek writer on astronomy. There is some doubt about the age in which he lived; or, which is the same thing, whether the manuscripts remaining which bear the name of Cleomedes were all written by one man, or by two men at different times. The manuscripts which remain are on astronomy, on the doctrine of the sphere, and on arithmetic. Vossius conjectures that the work on music attributed to Cleonidas belongs to Cleomedes. Riccioli seems to have been one of the first who supposed that there were two of this name, one about the time of Augustus, the other in the reign of Theodosius. The work on astronomy was attributed by Vossius to the latter; but the principal arguments against so late an author lie in his frequent mention of Pythagoras, Eratosthenes, Hipparchus, and Posidonius, and his entire silence about Ptolemaeus. See however the arguments of Letronne, 'Journal des Savans,' 1821, p. 713.

We mean by Cleomedes the one of that name who wrote the work *Περὶ κινητικῆς θεωρίας μετεώρων*, in two books, 'On the Circular Theory of the Heavenly Bodies.' It is professedly in several parts taken from a writing, or from the public lectures, of Posidonius, who was certainly the contemporary of Cicero. It is a probable conjecture that Cleomedes was a pupil of Posidonius. The work in question has considerable historical value; it records the measures of the earth by Posidonius and Eratosthenes, establishes the antiquity of the opinion that the rotation of the moon is equal to her synodical revolution round the earth;—had it been the sidereal revolution, it would have been correct. It gives various arguments in proof of the rotundity of the earth, in opposition to the supposition of flat and cubical forms, &c., and from this source the early English writers drew much of what they said on the same subject. It mentions eclipses as having happened without having been predicted in the 'canons,' a proof that something answering to an almanac was in common use. It decidedly suggests the possibility of rays of light being bent by the air. Delambre has made it sufficiently apparent that Cleomedes was not acquainted with the writings of Hipparchus, though he frequently cites opinions and methods which he attributes to him.

The earlier editions of Cleomedes are:—1. The Latin version of George Valla, Venice, 1497 or 1498. 2. In Latin, with Aristotle and Philo, Basel, 1533. 3. The first Greek edition, by Conrad Neobarius, Paris, 1539. 4. In Greek and Latin with Aratus, Proclus, and Dionysius, Basel, 1547; again in 1561; again in 1585. 5. In Greek and Latin, with a Commentary, by George Balfour, Bordeaux, 4to, 1605. This edition was re-published with additional notes, by Janus Bake, Leipzig, 1820; this also was re-published, with additional notes, by C. C. Theoph. Schmidt, Leipzig, 1831. The most esteemed manuscript is that in the public library at Wittenberg.

(Riccioli, Vossius, Weidler, Heilbronner, Delambre, *Hist. Astr. Anc.* i. 218.)

CLEOMENES, the name of several kings of Sparta. CLEOMENES I., son of Anaxandrides (Herod. v. 39), although not perfectly sane, succeeded his father. (Herod. v. 42.) He expelled the Peisistratides from Athens (Herod. v. 63, 64), B.C. 510, and espoused the cause of Isagoras in opposition to Cleisthenes (CLEISTHENES), who however with the seven hundred families that had been banished, afterwards returned and forced him to leave the city. Demaratus, the colleague of Cleomenes, accused him of favouring the Medes, while on an expedition against the Æginetes, and obliged him to return home. By the aid of Leotyichides, a private enemy of Demaratus, and by bribery of the Delphic oracle, Cleomenes succeeded in effecting the abdication of Demaratus. (Herod. vi. 65, 66.) In a war against the people of Argos (about B.C. 491, Clinton, 'Fast. Hel.' p. 425, note x.), Cleomenes was completely victorious, and burnt a great number of the fugitives in a sacred grove where they had taken refuge. (Herod. vi. 80.) The means by which he had contrived to get rid of Demaratus afterwards becoming known, he was banished into Thessaly and subsequently to Arcadia, where he endeavoured to stir up the people against the Lacedæmonians. (Herod. vi. 74.) He was ordered to return, and on his arrival in Sparta he confirmed the belief of his madness by mortally wounding himself (Herod. vi. 75), B.C. 492.

CLEOMENES II. succeeded his brother Agesipolis II. (Diodor. Sic. xv. 60), B.C. 370, and reigned sixty-one years: he died B.C. 309. (Clinton, *Fast. Hel.*, pp. 205, 213.)

CLEOMENES III. succeeded his father Leonidas on the throne of Sparta B.C. 236. Immediately on his accession he set himself to oppose Aratus and the Achæans, who were endeavouring to draw all the Peloponnesians into their league. The Ephori were averse to the war, and Cleomenes saw no way to attain his ends but by abolishing their power. Accordingly he put four of them to death, and attempted to excuse this act of violence by showing the necessity of restoring the ancient institutions of Lycurgus, which could not be effected by any other means. He renewed the old Spartan system of education, and himself observed great simplicity in his mode of life. His colleague of the house of Proclus, a child named Eurydamidas, the son of Agis IV., died it was said by poison, which Pausanias (2, 9) asserts was administered by the Ephori at the instigation of Cleomenes; but the story appears very improbable. However that may be, on the death of

Eurydamidas, Cleomenes shared the kingly power with his own brother Eucleidas. He also abolished the Gerusia, or senate, and transferred their powers to another body (patronomi) apparently of his own creating; but this rests solely on the authority of Pausanias. Cleomenes in his invasion of Achæa took several cities, and soon afterwards attacked Argos. In order more effectually to oppose Aratus, who had obtained the assistance of Antigonus, Cleomenes formed an alliance with Ptolemy, king of Egypt. The contending parties fought a decisive battle at Sellasia in Laconia, in which the Lacedæmonians were completely defeated: of 6000 men only 200 survived. After the battle Cleomenes fled to Egypt, where he was hospitably entertained by Ptolemy Euergetes. His son and successor however, Ptolemy Philopator, soon showed considerable jealousy of the royal guest, and accordingly put him in confinement. Cleomenes killed himself in the third year after his flight, and his body was afterwards nailed upon a cross by Ptolemy Philopator, B.C. 220 (Clinton, 'F. H.', 205). He reigned sixteen years. (Plutarch, 'Cleom.', c. 33.) Livy (xxiv. 26), following Polybius (iv.), represents Cleomenes as a tyrant; but Polybius was a native of a city (Megalopolis) which Cleomenes had destroyed, and the support of the Achæan league was a family concern. The truth appears to be that the great object of Cleomenes was to revive the ancient discipline and institutions of Lycurgus, and to put an end to the luxury and corruption which had crept into the state. If the means which he took were sometimes indefensible, it may perhaps be said in reply that his ends were good, and that such means were not entirely condemned by the positive morality of his age and country.

CLEON, of Athens, the son of Cleænetus, was originally a tanner. Early in life he began to take an active part in the political affairs of Athens, and his success seems to have drawn him from his business. He set himself up as the champion of the people, and was especially vehement in their cause when their interests appeared to be opposed to those of the rich. The first important affair in which he took a prominent part was the discussion on the massacre of the Mitylenæan prisoners, B.C. 427, who were sent to Athens after the reduction of the island by Paches. Such was the influence of Cleon on this occasion that he succeeded in persuading the assembly to pass a decree by which all the Mitylenæan prisoners sent to Athens by Paches, and every citizen in Mitylene, should be put to death, and the women and children made slaves. The prisoners, who had been sent to Athens, were massacred the same day to the number of more than one thousand; but the timely remorse of the Athenians prevented the execution of the remainder of the sentence. In an assembly called on the following day to reconsider the decree, Cleon came forward to support it with the utmost vehemence, and the majority of his opponent Diodotus was very small.

In B.C. 425 the Athenians built a small fort at Pylos, in Messenia, under the direction of their general, Demosthenes. The Lacedæmonians, with the view of destroying a post that would prove a great annoyance to them, made preparations to besiege it, and also threw a body of men into the small island of Sphacteria, which lay at the entrance of the harbour of Pylos. The island was immediately blockaded by the Athenians; but as there seemed no prospect of its being speedily taken, the Athenians at home began to complain, and Cleon accused the generals of want of activity in pressing the blockade. "If he were in command," he said, "he would soon finish the business." The people took him at his word; Nicias, one of the commanders at Pylos, insisted that Cleon should supersede him; and the demagogue, much against his will, was obliged to accept the command. However, he put the best face on the matter, and said that he would be back at Athens in twenty days, and would either bring with him all the Lacedæmonians in the island prisoners, or he would not leave a man of them alive. Demosthenes was his colleague in the expedition. He was as good as his word, and brought the Lacedæmonian prisoners to Athens within the twenty days. Thucydides, who rarely indulges in reflections on the character of persons in the body of his history, could not abstain from a side-blow at the demagogue general. The most sensible among the Athenians, he observes, were rather pleased at Cleon's being intrusted with the affair of Pylos, for they thought that the result in any event could not be otherwise than good: they would either get rid of Cleon for ever, which they rather expected, or, if they were disappointed in this, he would probably take the place.

Whether any of the merit of this exploit belonged to Cleon seems more than doubtful. (Aristoph., 'Equi,' 54, &c.) His prudence in the selection of his colleague cannot be questioned. The reputation which he gained for energy and promptitude in this affair, added to his inordinate vanity, completely turned his head; and it would seem by what followed as if many of his countrymen were so far deceived by this lucky business of Pylos as to think that Cleon actually had the talents that he pretended to. Accordingly in B.C. 422 he was fixed upon as the proper person to oppose the movements of the able Spartan general Brasidas in Macedonia and Thrace, and he received the undivided command of 1200 heavy-armed men and 300 horse, with still larger forces of Imbrians and Lemnians, and a fleet of 30 galleys. He did not march direct to Amphipolis, which was the principal object of the expedition, but stopped in his way to recover Torone. Brasidas, who had left the town, had stationed there a garrison which was inadequate for its defence, and accordingly Cleon was successful in his attack on the place. He sold all the women and children as slaves

and sent more than 700 men as prisoners to Athens. Proceeding with increased confidence in his own military powers, he stationed himself at Eion on the Strymon, and delayed the attack on Amphipolis till he had received reinforcements. During this interval he made a fruitless attempt on Stagirus, but succeeded in his attack on Galepsus. The murmurs of his soldiers, who from the first had not been pleased with Cleon's being appointed to the command, soon induced him to move towards Amphipolis with a view of reconnoitring, but not of fighting. Brasidas however, who was in Amphipolis, did not choose to let him off so easily: he made a sudden sally out of the place, while Cleon, who was quite unprepared for an attack, and had not the least intention to fight, was giving orders for a retreat. In the battle that ensued both the Lacedæmonian and the Athenian generals fell, B.C. 422. Cleon, says Thucydides (with a half malicious coolness), who had never had any idea of keeping his ground from the first, was caught as he ran away, and killed by a Myrcinian targeteer. The remains of the Athenian army returned home.

If Cleon possessed any qualifications at all as a statesman, they consisted not in superiority of talent or in political knowledge (for he had little of either), but in a singular facility of speaking and a great command of words, which, combined with low manners, unsparring abuse of those who were better than himself, and a coarse vehement mode of delivery, rendered him acceptable to the mob. Whatever influence he gained with the more considerate citizens seems to have arisen from the reputation which he gained for blunt honesty in the declaration of his sentiments, and a general promptness in action. The real qualities which he contrived to get so favourably interpreted appear to have been impudence and rashness. The indignation of the comic poet (Aristophanes) was at last roused to endeavour to suppress what seemed to defy all other opposition. Aristophanes levelled at Cleon the shafts of his satire, and held him up to public ridicule in the most ridiculous colours. On one occasion (in the 'Acharnenses'), alluding to the demagogue's former occupation, he threatens to "cut him into shoe-leather," and the comedy of 'The Knights' (*Ἰππικὴ*) was composed with the express object of destroying his authority, which had been raised to so extraordinary a pitch by his success in the affair of Pylæ. The victory at Sphacteria took place B.C. 425, and 'the Knights' was represented B.C. 424. Such was the dread of offending Cleon, that not an actor was to be found bold enough to personate him on the stage, while the mask-maker refused to give a representation of his face, and Aristophanes was obliged to act in that character himself, supplying the want of a mask by smearing his face with the lees of wine. [BRASIDAS; ARISTOPHANES.]

(Thucyd., iii., 36; iv., 21-40, &c.; v., 2-10; Aristoph., *Equites*; and Thirlwall, *Greece*, vol. iii.; but see also Grote, *Hist. of Greece*, vol. vi., for an extended and elaborate, though, as we think, unsuccessful effort to remove from Cleon the odium which almost every other historian has concurred in attaching to his name; Mr. Grote's theory being that Cleon was in fact the resolute champion of popular rights, and that Thucydides and Aristophanes from whom the received opinions respecting Cleon are derived were his personal enemies, while Thucydides was further animated by strong party spirit.)

CLEOPATRA (*Κλεοπάτρα*), a daughter of Ptolemy Auletes, king of Egypt, was born about B.C. 69. Her father, who died B.C. 51, left two sons called Ptolemy, besides Cleopatra and her sister Arsinoë. By her father's will Cleopatra and her elder brother were to be joint sovereigns, but they soon disagreed, and Cleopatra was obliged to take refuge in Syria. In B.C. 48, Julius Cæsar arriving in Syria in pursuit of Pompey, who had fled from the battle of Pharsalia, determined to carry the will of Ptolemy into effect, and to settle the dispute between Cleopatra and her brother. The youthful queen, who probably knew the character of the Dictator, contrived to get herself privately conveyed into his presence, and by her fascinating manners completely gained his favour. Though not remarkable for beauty, according to the testimony of ancient writers, which is confirmed by her medals, she possessed great natural abilities, which had been carefully cultivated. She is said to have spoken with facility several languages besides her native Greek; a circumstance in itself well calculated to give an artful woman a great ascendancy over all with whom she came in contact. Cæsar decided that Cleopatra should be restored to her equal share of power. This decision giving dissatisfaction to the young prince and his advisers, led to an attack upon Cæsar's quarters under Achillas, the commander of the king's troops. After a blockade of some months Cæsar received reinforcements, and completely defeated the party of the king, who was drowned in the Nile. The sovereign power was now given by Cæsar, in conformity with the meaning of Ptolemy's will, to Cleopatra and her younger brother Ptolemy. On Cæsar's return to Rome, Cleopatra shortly after followed him, and remained there till his assassination (B.C. 44), when she hastily quitted the city and returned to Egypt. (Cic. 'Ep. ad Att.', xiv. 8.)

In the fourth year of their joint reign Cleopatra murdered her brother Ptolemy. Her connection with Marc Antony commenced after the battle of Philippi, about B.C. 40, with the interview at Tarsus in Cilicia, of which Plutarch ('Anton.', 25-27) has given a minute description, and which Shakspeare, in his play of 'Antony and Cleopatra,' has turned into a glowing picture. Antony had no doubt seen Cleopatra during her residence at Rome, but, according to

Appian, he was first struck with her charms in Egypt (B.C. 55) when he accompanied Gabinius, who was commissioned to restore Ptolemy Auletes to his throne. Cleopatra at this their first interview was only in her fifteenth year. From the time of the meeting at Tarsus the destinies of Antony and Cleopatra were united. The voluptuous queen, whose love of pleasure was unbounded, found in Antony a companion to her taste; and she spared no pains to attract him by all the allurements that her inventive talents could devise. Her influence over him seems to have continued undiminished to the end of his life. If we may believe the extant authorities, Antony was even prevailed upon by Cleopatra to order her sister Arsinoë, who had taken sanctuary in the temple of Diana at Ephesus, to be put to death.

The return of Antony to Italy, and his marriage with Octavia, the half-sister of Octavianus, for a time separated him from the Queen of Egypt; but they met again in Syria (B.C. 36) previous to the unsuccessful Parthian expedition of that year, after which Antony renounced his wife for the charms of Cleopatra. Cleopatra was present at the decisive battle of Actium, and set the example of flight, which was followed by Antony. On the death of Antony, Cleopatra committed suicide in order to avoid the humiliation of being led in the triumphal procession of Octavianus. Most probably she took poison. According to the story in Plutarch, she was closely watched by the orders of Octavianus, who suspected her designs, but she procured a poisonous serpent to be introduced in a basket of figs. The queen, after using the bath, and partaking of a sumptuous repast, applied the deadly serpent to her arm. Two of her female attendants died with her. The emissaries of Augustus, who had received a letter from Cleopatra declaring her intention, came too late to save her for a Roman triumph. They found her body lying on a golden couch in her royal robes, with one of her attendants dead by her side, and the other with just strength enough remaining to fix the diadem on the head of her mistress. Cleopatra at the time of her death was in her thirty-ninth year. She was buried by order of Octavianus with royal honours in the same tomb with Antony. With Cleopatra ended (B.C. 30) the dynasty of the Greek kings of Egypt, which commenced with Ptolemy, the son of Lagus, B.C. 323.

She had by Julius Cæsar a son, Cæsarion, who was put to death by Octavianus at Rome. By Antony she had three children, Alexander, Ptolemy, and Cleopatra, all of whom adorned the triumph of Octavianus at Rome. Cleopatra afterwards married Juba, king of Mauritania. [ANTONY; AUGUSTUS; CÆSAR.]

(Plutarch; Appian; Dion Cassius.)
CLERC, JEAN LE, born at Geneva in 1657, was the son of Etienne le Clerc, and nephew to David le Clerc, a clergyman and professor of Hebrew at Geneva, both known for several theological works. Jean le Clerc early manifested great capabilities for learning joined to an extraordinary memory. He travelled in France and England, and at last settled at Amsterdam, where he became professor of philosophy and belles-lettres and of the ancient languages. He wrote a vast number of books, of very unequal merit, on all sorts of subjects. Those which made most noise at the time concern Biblical history and theological controversy, such as Latin commentaries on various books of the Bible, 5 vols. fol., Amsterdam, 1710-31; 'Harmonia Evangelica,' in Greek and Latin, fol., 1700; 'Traduction du Nouveau Testament, avec des notes,' 4to, 1703. These works pleased neither Catholic nor Protestant divines, from their having a tendency to Socinianism—a tendency made still more manifest by another work generally attributed to him, entitled 'Sentimens de quelques Théologiens de Hollande touchant l'Histoire Critique du Vieux Testament,' followed by a 'Défense' of the same work, 2 vols. 8vo, 1685. In these the author openly attacks the inspiration of the Scriptures and the very foundation of Revelation. As a critic, Le Clerc published his 'Ars Critica,' 3 vols. 8vo, 1712-30, a work which is much esteemed; and he also edited the 'Bibliothèque Historique et Universelle,' a periodical begun in 1687 and closed in 1693, making 26 vols. 12mo; the 'Bibliothèque Choisie,' 1712-18, 28 vols. 12mo; and the 'Bibliothèque Ancienne et Moderne,' 1726-30, 29 vols. 12mo. These literary journals enjoyed a good reputation in their days. He also wrote—1, 'Parrhasiann, ou Pensées diverses sur des matières de Critique, d'Histoire, de Morale, et de Politique,' 2 vols. 12mo, 1701, a compilation to which he has added some hasty reflections, and many favourable comments upon his own works; 2, 'Histoire des Provinces Unies des Pays Bas,' from 1650 to 1728, 2 vols. fol., Amsterdam, 1738; 3, 'Histoire du Cardinal de Richelieu,' 2 vols. 12mo, 1714; 4, 'Traité de l'Incrédulité,' 8vo, 1733, in which he examines and discusses the various motives and reasons which occasion many to reject Christianity. He also wrote a number of polemical works and pamphlets, most of which were tinged with bitterness and dogmatism. Le Clerc was one of the first critics of his age, but it was an age in which the critical art had not attained a high degree of excellence. He was learned, had quickness and penetration, and a great facility of composition; but he generally wrote in haste and upon too many and various subjects, having at times five or six works in hand at once. He published also a supplement to 'Moreri's Dictionary,' and several editions of ancient classics, among others Livy, Ausonius, Sulpicius Severus, &c. His edition of Menander and Philemon's fragments was severely criticised by Dr. Bentley. In 1728, while he was giving his lecture, Le Clerc suddenly lost the use of his speech through a paralytic stroke. After lingering

some years in a state bordering upon idiocy, he died at Amsterdam, on the 8th of January, 1736.

CLERC, SEBASTIEN LE, a celebrated French designer and etcher, was born at Metz in 1637. His father, who was a clever goldsmith, instructed him in the rudiments of drawing and engraving. Sebastien Le Clerc commenced his career as a civil and military engineer; but, having met with some unjust treatment, he resigned a place which he held under the Marshal de la Ferté, and in 1665 settled in Paris, where, by the advice of Le Brun, he devoted himself exclusively to engraving or etching, an art for which he showed the highest ability. He had also a fertile invention, and great ability as a designer.

In 1668 Le Clerc published a '*Géométrie Pratique*' in eighty plates, which procured him the notice of Colbert, who gave him an appointment in the Gobelins tapestry manufactory, with apartments in the factory, and a salary of 3000 francs. Whilst in this situation he married the daughter of Vander Kerkhove, the dyer of the establishment, by whom he had sixteen children; and his family increased so rapidly that he was forced to give up his situation, and to try his fortune by working for the public at large. About 1684 he was elected a member of the Royal Academy of Painting, and appointed Professor of Perspective, an office which he held for thirty years. In 1693 he was nominated Engraver in Ordinary to the King (Louis XIV.); and he was created about the same time a Knight, by Pope Clement XI. He used to sign himself Chevalier Romain. He died at Paris in 1714.

Le Clerc's etchings and engravings are very numerous. They are said to exceed 3000; and his designs are twice as numerous: they include nearly all subjects except shipping. His master-pieces are, the '*Academy of the Arts and Sciences*,' the '*Entrance of Alexander the Great into Babylon*,' and the '*Feeding of the Five Thousand*,' from his own compositions. A complete list of his works, preceded by a memoir, was published at Paris in 1774, by C. A. de Jombert, entitled '*Catalogue Raisonné de l'Œuvre de Seb. le Clerc*.' Heineken also has given a long list of his principal works in his '*Dictionnaire des Artistes*,' &c. Le Clerc was the author of several scientific works. He published a '*Traité de Géométrie*,' a '*Nouveau Système du Monde*,' a '*Système de la Vision*,' and a '*Traité d'Architecture*.'

SEBASTIEN LE CLERC, his son, was a good historical painter. He was elected a member of the Royal Academy in 1704, and died in 1767, aged eighty-three. Several of his works also have been engraved.

CLERK, JOHN (of Eldin, N.B.), was the inventor of one of the most important parts of the modern British system of naval tactics. In 1779 he communicated to some friends his notions concerning what is technically called 'breaking the line.' In 1780 he communicated his plan to Mr. Richard Atkinson, the particular friend of Sir George (afterwards Lord) Rodney, and that distinguished officer, before leaving London, said he would strictly adhere to it in fighting the enemy. On the 12th of April 1782, when the experiment was tried for the first time, it led to Rodney's decisive victory over the French, under De Grasse, in the West Indies. From that time the principle has been frequently adopted; and during the war with France, under Napoleon I., when Howe, Nelson, and others executed the manoeuvre in perfection, it was uniformly attended with success. His views were embodied in '*An Essay on Naval Tactics*, systematical and historical, with explanatory plates, in 4 parts, by John Clerk, Esq., of Eldin, &c.' (see also an excellent article in the '*Edinburgh Review*,' vol. vi. p. 301). A few copies of the first part of this valuable essay were distributed among friends in the beginning of 1782. This part was reprinted and published in 1790, and the second, third, and fourth parts were added in 1797. Mr. Clerk was no sailor, and had never even made a single sea-voyage.

Such is the account given by Mr. Clerk's relatives and friends, but it has been indignantly contradicted in various publications by General Sir Howard Douglas. In a circumstantial narrative of Admiral Rodney's battle, he proves that the passage of the British through the enemy's line, and thereby cutting off the rear ships, arose from the chance position of the two fleets, and was one of those happy and unpremeditated decisions of the moment which always characterise a great and successful commander. By a close examination of dates, he also shows that Mr. Clerk's ingenious essay could not have been communicated to Lord Rodney before the engagement took place; and he supports these statements by letters and other documents which have fallen into his hands since the death of his father, the late Admiral Sir Charles Douglas, who was at that time Rodney's 'captain of the fleet,' and therefore minutely acquainted with all the transactions. (See the several publications on this subject by Lieutenant-General Sir Howard Douglas, Bart.) Other writers have taken part in the controversy, but, as far as we are aware, nothing material has been added beyond what is stated above. Mr. Clerk died in July 1812.

CLEVELAND, CLEIVELAND, or CLEAVELAND, JOHN, was born at Loughborough, Leicestershire, in 1613, and studied at Cambridge, where he became a college tutor and reader in rhetoric. On the breaking out of the civil war he joined the royal army, and distinguished himself both as an active soldier and as one of the most severe and biting writers of lampoons on the Roundheads. He died in London in 1658. Those few verses of his, chiefly love-poems, which rise above personalities and temporary interests, possess occasional

richness of fancy; but they are deformed by the most perverse conceits anywhere to be found in the circle of that which has been called the metaphysical poetry of the 17th century. The most complete edition of Cleveland's works appeared in 8vo in 1687.

CLINTON, DE WITT, has a claim to biographical notice chiefly as the persevering promoter of the project for the formation of the great canal from Lake Erie to the Atlantic. He was born in 1769, at Little Britain, Orange county, New York. His mother was one of the distinguished Dutch family of De Witt; and his father, who was of English extraction, served with great distinction as brigadier-general in the army of the United States during the revolutionary war. De Witt received his education at Colombia College, New York, and was admitted to the bar. In 1797 he was elected by the democratic party to the state legislature of New York; having previously officiated for several years as secretary to his uncle George Clinton, as well as to the regents of the university and board of fortifications of New York. In 1801 he was elected a member of the senate of the United States. He afterwards filled the office of mayor of New York until 1815, when he resigned, mainly in consequence of having been unsuccessful in his candidature for the presidency of the United States. During the period between 1817 and 1826, he was several times elected governor of the state of New York by the zealous exertions of the democratic party. He was one of the founders of the New York Historical Society, the Academy of Arts, and the Orphan Asylum of New York, a member of most of the literary and scientific societies of the United States, and of several similar institutions in Europe. His productions consist of his speeches made on various occasions in the performance of his official duties, papers read before literary and benevolent societies, correspondence concerning the canal; judicial opinions, and various fugitive compositions. His services to his native state were very important, and his character, as a lover of science and polite literature, was adorned by a generous benevolence. He died suddenly in 1828, and was interred with great public demonstrations of respect.

CLINTON, HENRY FYNES, was born January 14, 1781, at Gamston in Nottinghamshire. He was the eldest son of the Rev. Charles Fynes Clinton, D.D., prebendary of Westminster, and incumbent of St. Margaret's, Westminster, and was descended in direct line from Henry, second earl of Lincoln. The family name was Fynes till his father obtained a royal licence, April 26, 1821, to resume the ancient family name of Clinton.

Mr. Clinton was educated at Southwell School, Nottinghamshire, where he remained from 1789 till 1796, and was well grounded in the classic languages. In September 1796 he was removed to Westminster School, where he remained till Easter 1799, not on the foundation. In April 1799 he went to Oxford, where he was entered a commoner of Christ Church, and remained till 1806. He graduated B.A. in 1803, and M.A. in 1805.

At the general election of 1806 he was returned M.P. for Aldborough, through the interest of the Duke of Newcastle, and continued to be one of the representatives of that borough till the dissolution of 1826, after which he was succeeded in his seat by his next brother. He was diligent in his parliamentary attendance, but was not a speaker. In his politics he was a conservative. After the death of Mr. Planta, in December 1827, he was a candidate for the office of principal librarian of the British Museum; but the claims of Sir Henry Ellis from long service and experience determined the choice of the Marquis of Lansdowne, then Home Secretary, in his favour. Mr. Clinton inherited an ample fortune from a distant relative. He died at his residence, Welwyn, Hertfordshire, October 24, 1852.

Mr. Clinton married June 22, 1809, but his wife died February 2, 1810. He married January 6, 1812, a daughter of Dr. Majendie, bishop of Bangor, who survived him, together with eight daughters. His only son, Charles Francis Clinton, graduated B.A. of Christ Church, Oxford, in 1836, served in Spain in the Christiano army, was decorated with the Cross of San Fernando by Epartero, was appointed in 1843 British arbitrator under the treaty with Portugal for the abolition of slavery, and died at Loando, on the west coast of Africa, in 1844.

Mr. Clinton was a classical scholar of the highest class. He read carefully all the best works of the Greek and Roman writers with a diligence perhaps unexampled, at least in modern times. He himself states, that while at Oxford, during less than seven years, he read 5223 pages of the Greek poets and prose-writers; but that afterwards, between 1810 and 1820, he read about 40,000 pages: the reading at Oxford amounting to 746 pages annually, while the reading during 1810-20 amounts to 4000 pages annually, which is at any rate more than five times greater.

Mr. Clinton's two great works, the '*Fasti Hellenici*' and '*Fasti Romani*,' have a European reputation, and are literary works of which every English scholar may well be proud. The '*Fasti Hellenici*' (the '*Civil and Literary Chronology of Greece*'), 3 vols. 4to, Oxford, was commenced in 1810, and was published in four separate volumes in 1824, 1827, 1830, and 1834; but the work is now divided into 3 vols., which are sold separately—vol. i. extending from the earliest accounts to the 55th Olympiad, vol. ii. from the 55th to the 124th Olympiad, and vol. iii. from the 124th Olympiad to the death of Augustus. Besides the chronological tables, of which these volumes for the most part consist, they are interspersed with dissertations on the early inhabitants of Greece, the Messenian wars, scripture chronology, the

writings of Homer, the population of ancient Greece, and other interesting subjects. The 'Fasti Romani' (the 'Civil and Literary Chronology of Rome and Constantinople, from the Death of Augustus to the Death of Heraclius'), 2 vols. 4to, Oxford, were published in 1845 and 1850. In 1851 Mr. Clinton published 'An Epitome of the Civil and Literary Chronology of Greece, from the Earliest Accounts to the Death of Augustus,' 8vo, Oxford; and in 1853 appeared 'An Epitome of the Civil and Literary Chronology of Rome and Constantinople, from the Death of Augustus to the Death of Heraclius,' 8vo, Oxford: two abridgments which are very useful to those students who cannot afford to purchase the larger and more expensive works.

(*Literary Remains of H. P. Clinton, Edited by C. J. F. Clinton, 1854; Gentleman's Magazine.*)

CLITUS, or CLEITUS. [ALEXANDER III.]

CLIVE, ROBERT, LORD, was born on the 29th of September 1725, at Stycbe, near Market Drayton, Shropshire. His family was respectable, but poor. He was sent to several schools, but distinguished himself in all of them rather by a love of mischief and a fearless disposition than by any aptitude or love for learning. He was sent to India, and arrived at Madras, in the civil service, as a writer, in 1744. Three years after, he quitted the civil service of the Company for the military, which suited him much better. In 1748 he distinguished himself at the siege of Pondicherry, and shortly after at the taking of Devi-Cotta, in Tanjore, on which occasion his superior officer recommended him to the notice of the Company and the British government. Coming into contact with the French (with whom, and not with the natives of India, the main struggle lay), he beat them under their veteran commanders. The taking of Arcot, and the decisive victory gained by the British there, were chiefly owing to this young and comparatively inexperienced officer. On his return to England in 1753 for the recovery of his health, he was highly complimented by the Directory of the East India Company. In 1755 he went again to India as governor of Fort St. David, and with the rank of lieutenant-colonel in the king's service. Soon after his arrival, in conjunction with the naval commanders, Watson and Pocock, he reduced the dangerous pirate Angria, taking Gheriah, his capital, and all his treasures. In the meantime the nabob Sujah-u-Dowlah had attacked the British, destroyed their factories, and barbarously thrown part of his prisoners into the memorable 'Black Hole' of Calcutta. Colonel Clive was then, according to the admission of all parties, the main stay and only hope of the British in India. He sailed at once with Admiral Watson to Calcutta, took Fort St. William in January 1757, and following up his advantages, thoroughly defeated and disorganised the Sujah's army. Clive's victories led to a peace highly advantageous to the British power in India, which before this event was dwindling to nothing. A series of intrigues and recriminations followed: Clive accused Dowlah of being wholly devoted to the French interests,—a cruel tyrant over his subjects,—a man without honour, in whom there could be no faith or confidence. On the other side it was urged that Clive, insatiable of power, influence, and wealth, had from the beginning determined to dethrone that nabob; that with this view he had engaged in intrigues with Meer Jaffer, one of the nabob's officers, and with Omichund, a Gentoo merchant, whom, it was said, he afterwards defrauded. In all these transactions the observation of the rigid rule of right is not to be expected on either side. Clive's business was to advance the British power in India, and the nabob happened to be at once an impediment in his way, and a cruel tyrant, after the fashion of that country. The war that ensued was short and brilliant, for, with a 'handful of men,' Clive gained the great victory of Plassey, and on the next day entering Moorshedabad in triumph, installed Meer Jaffer, who took the style of Jaffer-Ali-Cawn, in the place of Sujah-u-Dowlah. The deposed nabob was soon taken, and privately put to death by Meer Jaffer's son. The new nabob gave Clive a jaghire, or grant of land, which was said to produce 27,000*l.* per annum. Clive being made governor of Calcutta, held the chief command there, and through the rest of British Bengal, for about two years.

In 1759 he destroyed a formidable Dutch armament sent against Bengal. In 1760 he returned to England, where he received the unanimous thanks of the Company, and was created by government an Irish peer, under the title of Lord Clive, baron of Plassey. He was returned to parliament for Shrewsbury, and kept his seat in the House of Commons till his death. In politics he was rather liberal, being what was then called a 'moderate Whig;' but he exercised a prodigious influence on parliamentary elections. Speaking of his title of Lord, he says, in a letter to his friend Major Carnac, "If health had not deserted me on my arrival in England, in all probability I should have been an English peer instead of an Irish one, with the promise of a red riband. I know I could have bought the title (which is usual), but that I was above, and the honours I have obtained are free and voluntary."

After Clive's departure, the affairs of India fell into an apparently hopeless state of confusion, and he was once more sent out (in 1761) as the only man at all likely to retrieve them. Before this last employment he received the order of the Bath, and was promoted to the rank of major-general. In spite of dissensions and intrigues, and an almost general opposition on the part of the employés of the Company, both civil and military, he set things in order, and gave

security to that broad basis on which the British power has been since raised in India. He however made many enemies, whose influence he felt a few years later.

He returned from India on the 14th of July 1767, with a constitution thoroughly shattered. He was received with the greatest distinction. Five years later (in 1772) his proceedings in India were made the subject of severe animadversion in parliament, and out of doors; and in 1773 a select committee of the House of Commons was appointed to examine into them. The charges presented to the House were most serious, involving even a charge of forgery; but on the great debate on the 22nd of May the combat was narrowed into a motion made by Colonel Burgoyne, and seconded by Sir William Meredith—"That in the acquisition of his wealth Lord Clive had abused the powers with which he was intrusted." This motion was rejected, and at five o'clock in the morning a resolution was passed—"That Lord Clive had rendered great and praiseworthy services to his country." He was thus acquitted, but the course of the trial was a process of torture to his proud spirit; nor was the form of the acquittal altogether satisfactory. He never held up his head again, and towards the end of the following year he committed suicide. Soon after his first arrival in India, in consequence of a painful disorder he accustomed himself to take opium, the pernicious doses of which he gradually increased. After his last arrival in England, he suffered from a complication of disorders; and to alleviate the anguish of the gall-stones he swallowed opium in greater quantities than ever. His death took place on the 22nd of November 1774, at his house in Berkeley-square, shortly after completing his forty-ninth year.

(*Life of Robert Lord Clive, collected from the Family Papers, &c., by Major-General Sir John Malcolm, 3 vols. 8vo, 1836; and see the brilliant examen of Lord Clive's career and services by Macaulay, reprinted in his Essays.*)

CLODIUS PUBLIUS, a Roman patrician, the son of Appius, first became notorious by introducing himself in the disguise of a woman into Caesar's house during the celebration of the sacred rites of the Bona Dea. For this offence he was tried, but by the help of his hirelings and dependents, and by bribing the judges, he was acquitted. (Cicero, 'Ep. ad Attic.' i. 12. 16.) Cicero, who was called to give evidence on this trial, made a very unfavourable statement respecting his character, for which Clodius never forgave him. It was chiefly in order to revenge himself on so formidable an enemy, that Clodius took measures to qualify himself for the office of tribune of the people. With this view he got himself adopted into a plebeian family, though with considerable difficulty, and not without the help of Caesar and Pompey. No sooner was he elected tribune than he applied all his energies to effect the ruin of Cicero. [CICERO.]

In B.C. 57, when Lentulus had brought before the senate a proposal to recall Cicero from banishment, a day was fixed for taking the sense of the people. Fabricius, one of the tribunes, who favoured the cause of Cicero, endeavoured to possess the place of assembly with armed men, but it had been pre-occupied by Clodius. An encounter followed, in which Clodius was victorious, and followed up his advantage by massacring a considerable number of persons. Milo undertook to prosecute him for these outrages, but it was useless to proceed in the regular manner against a man who employed bodies of gladiators in his defence. Milo accordingly provided himself in a similar way, and the two parties had frequent engagements in the streets of Rome. When Cicero was recalled from exile, a question was raised, whether the ground on which his house had stood, and his property, which had been alienated to religious uses, should be restored to him or not. Clodius made a vehement speech against the restoration; but the point being decided in Cicero's favour, enraged Clodius beyond all bounds, and he made an attempt on Cicero's life. He contrived to screen himself from another trial, which he apprehended, by getting himself elected *exile*; and no sooner was Milo's tribuneship expired, than he took advantage of the circumstance to prosecute him for acts of violence. Cicero appeared in defence of Milo, who was acquitted. In B.C. 52 Clodius was a candidate for the praetorship. Shortly after, Milo, in his way from Rome to Lanuvium, a distance of about fifteen miles, met Clodius returning from his country-seat at Aricia. The meeting appears to have been accidental; but through the officiousness of a gladiator in Milo's retinue, a fray ensued, in which Clodius received a severe wound. He was carried into an inn at Bovillae, to be attended to; but Milo, wishing his men to make the most of their victory, Clodius was dragged out of the inn, and killed in the high-road. (Appian, 'De Bell. Civ.' ii. 439.) Milo was tried for the murder, and Cicero spoke, though ineffectually, in his defence. Milo withdrew before his condemnation, and retired into exile at Massilia (Marseille).

(Cicero, *Ep. ad Atticum, Pro Milone, Pro Domo Sua*; Plutarch, *Life of Cicero*.)

CLOOTZ, JEAN BAPTISTE (DU VAL DE GRACE), Baron, whose immeasurable frenzy makes the wildest Jacobins seem tame, was born at Cleves in 1755. He was a nephew of the learned but paradoxical Dutch writer, Cornelius de Pauw. Long before the stormy days of the French revolution he had conceived the idea of reforming the human race, and travelled through England, Germany, Italy, &c., under the name of Anacharsis Clootz, denouncing all kings, princes, and rulers, and even the Deity. He returned to Paris, where he had completed his education, about the period of the meeting of the States-

General, attended all the clubs, exceeded in his ravings the most furious demagogues, and was elected a member of the Convention in September 1792. He voted for the king's death, adding, "I likewise pass sentence on Frederick William, king of Prussia." A few weak-minded men yielded to his rhapsodies, and this enthusiast was beginning to form a party when Robespierre, feeling uneasy, denounced the 'Orator of the Human Race,' as the baron styled himself, and sent him to the same scaffold as Hebert, on March 24, 1794. He requested that he might be executed the last, "that he might establish one or two more principles whilst his companions' heads were falling." (Rabbe; *Biogr. des Contempor.*)

CLOTAIRE I., the youngest son of Clovis, the conqueror of the Gauls, and of his wife Clotilda. Clovis having divided his territories at his death in 511 among his four sons, Clotaire became king of Soissons. He joined his brothers in their war against the Burgundians, which ended in the defeat of the Burgundians, and the extinction of the first kingdom of Burgundy, which was divided among the brother kings of the Franks. Clotaire and his brother Childebert, king of Paris, invaded the kingdom of Orléans after the death of their brother Chlodomère, and murdered two of his sons. The third, named Chlodovalde, concealed himself in a hermitage near Paris, where the village of St. Cloud has since risen. After the death of his nephew Theodebert, king of Austrasia, Clotaire took possession of that kingdom also; and after the death of Childebert, Clotaire united in his person the whole monarchy of the Franks in 558. His natural son, Chramne, having revolted against him, joined the Count of Brittany, who maintained his independence against the kings of the Franks. Clotaire defeated his son, and burnt him alive with his family in a hut in which he had taken shelter, in 560. In 562 Clotaire died, and was buried in the church of St. Medard of Soissons. He left four sons, among whom, following the example of his father, he divided the monarchy of the Franks. Caribert was made king of Paris, Gontran king of Orléans and Burgundy, Siegbert king of Metz or Austrasia, and Chilperic king of Soissons.

CLOTAIRE II. was the son of Chilperic, king of Soissons, or of Neustria, and of his wife Fredegonda. His father died, and left him an infant, under the regency of his mother. After many cruel wars, occasioned by the rivalships between Fredegonda and Brunehaut, the wife of Siegbert, king of Austrasia, Clotaire united in his person the whole empire of the Franks, as his grandfather Clotaire I. had done before him, in 613. Having taken Brunehaut prisoner, he put her to a cruel death. Clotaire, in order to conciliate his new subjects of the kingdoms of Burgundy and Austrasia, appointed a *Maire du Palais*, Major Domus Regis, to each for life. The office previously seems to have been held, as well as in Neustria, during pleasure only. The *Maires of Austrasia*, in the following reigns, became by degrees independent of the sovereign, and at last usurped the supreme power. At the council of Paris in 615 Clotaire issued general ordinances, which were called 'Capitularia.' He also convoked at times a kind of temporary parliament, which was an assembly of the chief officers of the Franks. Clotaire had to sustain a war in his German dominions beyond the Rhine against the Saxons, whom he defeated with the loss of their king in 626. In 628 Clotaire died, aged forty-five years, and was buried at Paris in the church of St. Germain-des-Prés. Clotaire II. was a man of abilities and of considerable information for his time: he was brave and popular, but ambitious, unprincipled, and cruel, like most of the Merovingian kings.

CLOTILDE, MARGUERITE ELEONORE, born at Vallon Chalis in the Vivarais, on the banks of the Ardèche, about 1405, married Béranger de Surville, who soon after joined the army of the dauphin, afterwards Charles VII., and was killed at the siege of Orléans. During his absence Clotilde is said to have composed and addressed to him her first epistle, which she called 'Héroïde,' in imitation of Ovid's compositions of the same name. Her other poems she is said to have composed during her long widowhood. They consist chiefly of ballads, rondeaux, chansons, epistles, with fragments of an epic poem. The last in date is a chant-royal, on the occasion of the battle of Fornovo, gained by Charles VIII. But the authenticity of these compositions is very much doubted. It rests merely on the reported assertion of Joseph Etienne de Surville, a descendant of Béranger, and an officer in the royal army, who emigrated at the time of the French revolution, but who, having re-entered France in 1798, was tried and executed. He is said to have discovered Clotilde's autograph manuscripts among the family papers, which however were all destroyed at the time when the peasantry went about burning the mansions of the nobility. He entrusted some friends with a copy of the poems, which were first published by Vanderbourg in 1803, with a biography of Clotilde. For the controversy about their authenticity see 'Biographie Universelle,' article 'Surville' (Clotilde), and the authorities referred to; among others, Raynouard's article in the 'Journal des Savans,' July, 1824. The poems are not without merit; and if not written by Clotilde they are a very clever imitation of the old French style of the 15th century, although some of the images and expressions appear to betray a later origin. Clotilde is said to have died at a very advanced age.

CLOVIS, CLODOVEUS, and CHLODWIG in old German, whence Ludwig, the Latinized form Ludovicus, and Louis are derived, was born A.D. 467. He was the son of Childeric, the grandson of Merowig, who gave his name to the Merovingian dynasty. Tournay was

then the capital of the Salian Franks, who had occupied the north-east part of Gaul, and extended their incursions as far as Paris. After the death of Childeric in 481, Clovis attacked Siagrius, the Roman commander, defeated him near Soissons, took him prisoner, and beheaded him. Having conquered the whole country, south and west, as far as the Seine, he fixed his residence at Soissons. He afterwards got rid, by force or treachery, of the other Frankish chiefs, his own relatives, who held various parts of North Gaul: Siegbert, king of Cologne, Cararic, king of the Morini, Ranacarius, king of Cambrai, and others, all perished by his hand.

In 493 Clovis married Clotilda, the daughter of Childeric, king of the Burgundians, who was a Christian. Clovis and most of the Franks were still Pagans. In 496 Clovis fought a great battle at Tolbiac, near Cologne, against the Alemanni, who had advanced to the Rhine and threatened Gaul. In the most critical moment of the fight, it is said that he made a vow to acknowledge the God of Clotilda if he remained conqueror. The Alemanni were completely defeated, and Clovis and most of his soldiers were christened on Christmas day of the same year, by Remi, archbishop of Rheims. The Gauls and Romans of the western provinces, as far as the mouth of the Loire, submitted voluntarily to Clovis.

He next turned his arms against Alaric II., king of the Visigoths, in the south-west part of Gaul, whom he defeated in the battle of Vouilli, near Poitiers, in 507; Alaric fell, and Clovis took possession of the whole country as far as the Pyrenees. Theodoric, king of the Goths in Italy, coming to the assistance of his countrymen, defeated Clovis near Arles, in 509, after which peace was made between the Goths and the Franks. Anastasius I., emperor of Constantinople, bestowed upon Clovis the titles of Patrician and Augustus, and in 510 sent him a crown of gold and a mantle of purple. Clovis now fixed his residence at Paris. In 511, at the Council of Orléans, the rights called *Regalia*, by which on every vacancy of a see, the revenues devolved on the king, who had the right of nomination, were acknowledged by the bishops as vested in the kings of the Franks. Clovis caused the laws and customs of the Salian Franks to be compiled and arranged to serve as a code for his Frankish subjects. His Gaulish and Roman subjects were subject to the Theodosian Code. In 511 Clovis died at Paris, after a reign of thirty years, and was buried in the church of St. Peter and Paul, afterwards called Sainte Geneviève. When the old church of Sainte Geneviève was pulled down on May 10, 1807, two sarcophagi of stone were found with the remains of Clovis and his wife Clotilda, as well as an epitaph upon the former, written long after his death. They are preserved in the 'Musée des Monuments Français,' as well as a statue of Clovis, erected to his memory by King Robert, towards the beginning of the 11th century. Clovis left four sons, among whom he divided his monarchy. [CLOTAIRE I.] Clovis first reduced the Franks to the condition of a united and partly civilised nation. His conversion to Christianity conciliated the clergy as well as his Roman and Gaulish subjects, most of whom had embraced that faith.

CLOWES, WILLIAM, printer, was born at Chichester, January 1, 1779; died January 26, 1847. The father of Mr. Clowes was educated at Oxford, and kept a large school at Chichester; but he died when the subject of this notice was an infant, leaving his widow to support two children with straitened means. She was enabled, by keeping a small school, to give her son a business education; and he was apprenticed to Mr. Seagrave, a printer at Chichester. He came to London in 1802, and worked as a compositor with Mr. Teape, of Tower Hill. In 1803 he commenced business on his own account in Villiers-street, Strand, on a capital of 350*l*. He purchased one press; engaged one assistant; and, after working as a compositor through the day, would often, for two or three consecutive nights, toil at press, to have his small stock of type free for the next day's demand. It was this energy of character that raised Mr. Clowes to his subsequent eminence. Fortune favoured his exertions. He married, when he was at the age of twenty-four, a cousin of Mr. Winchester, a stationer, who had much government business; and by him he was recommended for important official work. His punctual industry and obliging and kindly disposition brought friends around him; and in a few years the humble beginner with one press had a considerable printing-office in Northumberland Court. This office was burnt down; but a larger rose in its place. In 1823 he commenced steam-printing. He had two or three machines in a dark cellar; and, the process being novel, his office had many visitors of literary reputation. Mr. Clowes was always a signal example of the honest ardour of manufacturing enterprise to lead the way under new circumstances. He saw that newspapers were printed by steam; and he estimated the possibility that books might be demanded in sufficiently large numbers to make the new invention of more universal application than was at first considered probable. An action brought by the Duke of Northumberland, whose palace was close to Mr. Clowes's printing-office, to abate the steam-press as a nuisance, was successfully defended; but the printer removed his noise and his dirt, under the award of arbitrators; and the decision was a fortunate one for him. In 1826 he became the occupier of the spacious and well-known premises in Duke-street, Stamford-street. In the course of years the humble establishment of the young Sussex compositor grew into 24 steam-presses and 28 hand-presses, giving employ to 600 persons, in the largest, most complete, and well-organised printing manufactory that had ever existed in the world. The creation

of a literature that should at once reconcile the apparently dissimilar qualities of goodness and cheapness, through a demand for books before unprecedented, gave a considerable impulse to the energies of Mr. Clowes. 'The Penny Magazine' and 'The Penny Cyclopædia' issued with undeviating regularity for fourteen years from his printing-office. Mr. Clowes was not a common man. His powers of arrangement were most acute; he was at once bold and prudent. He was one of those few men who would not recognise the word 'impossible' as one to be lightly employed. He who in 1803 had a few hundred weight of type to be worked from day to day like a banker's gold, would not hesitate, in the height of his prosperous career, to have tons of type locked up for months in some ponderous blue-book. To print an Official Report of a hundred folio pages in a day or night, or of a thousand pages in a week, was no uncommon occurrence. Mr. Clowes's name will not be associated with the honours of the great classical printers; his was another ambition. He lived in an age when knowledge was to become the inheritance of the many; and he furnished the means of carrying out this literary revolution in a more efficient manner than any of his professional competitors. His name will be permanently associated with the intellectual development of our time. (*National Cyclopædia*.)

CLUSIUS, CAROLUS, or DE LE CLUSE, CHARLES, was born at Antwerp on the 18th of February 1526. He commenced his education at Ghent, and from thence was removed to Louvain with the object of studying the law. But in about two years he went to Marburg, where, disgusted with the law, he turned to the study of philosophy. During this period he acquired a great fondness for botany, and devoted much of his leisure to this pursuit. At Marburg he formed a friendship with Hyperius, who inspired him with an admiration for Melancthon, and in 1549 he left Marburg for the purpose of studying at Wittenberg. From Wittenberg he proceeded to Strasbourg, and from thence to Montpellier, where he became the pupil of Rondelet, and devoted himself to the study of medicine, which he pursued long enough to take the degree of Doctor. He resided for three years at Montpellier, and then proceeded to Paris, where he remained for two years, but was compelled to leave on account of a civil war which broke out at that period. From this time he visited most of the countries of Europe for the purpose of adding to his botanical knowledge. In 1564 he travelled through Germany, from thence he went with Fuggers to Spain, and afterwards visited Portugal. In 1571 he returned to Belgium, and again visited Paris, from whence he went to England, where he remained some time, being much interested with the results of the voyages of Sir Francis Drake and other British sailors. He returned to Antwerp in 1573. Here he occupied himself with publishing the result of his botanical labours. Having accepted the invitation of the Emperor Maximilian II. to become curator of the botanical garden at Vienna, he remained there till 1587; when, through a court intrigue, he was obliged to retire. He then lived at Frankfurt in a state of perfect obscurity till, in 1593, in the sixty-eighth year of his age, he was called to the chair of botany at Leyden. This position he held for sixteen years, and died on the 4th of April 1609.

Few men have suffered more in following a favourite pursuit than Clusius. He has on this account been called "The Martyr of Botany." As early as his twenty-fourth year, by excessive fatigue he contracted a dropsical disease, which it is said his tutor Rondelet cured with chicory. At the age of thirty-nine he broke his right thigh during one of his botanical rambles, and a short time after his right arm. Whilst at Vienna, he dislocated his left ankle, and eight years after this accident he dislocated his right hip. For this he was treated unskilfully, and ever after was obliged to use crutches for support. The want of exercise in one who had habituated himself to so much brought on other diseases, the most distressing of which was stone in the bladder. During his exertions in the early part of his life he also contracted a hernia, which troubled him to the end of his days. But his bodily infirmities never diminished his mental activity, and he continued teaching and writing to the very last. His works are very numerous, for he not only published original descriptions of new plants, but he translated into Latin works from the French, Spanish, and Portuguese, and from the Latin into French, thus rendering a most important service in the diffusion of a knowledge of the plants that were known in his day.

The following are his principal works:—1. 'Histoire des Plantes, en laquelle est contenue la Description entière des Herbes, leurs espèces, formes, noms, temperaments, vertus, et operations,' Antwerp, 1557, folio. This was a translation of a work by Dodoens, to which Clusius appended a chapter of his own, on gums, liquors, woods, fruits, and aromatic roots. 2. 'Antidotarium Florentinum,' Antwerp, 1561, 8vo. This was a translation of an Italian work containing an account of the medicines used by the Greek, Arabian, and Florentine physicians. 3. 'Aromatum et Simplicium aliquot Medicamentorum apud Indos nascentium Historia,' Antwerp, 1567, 8vo. This work went through many editions, and was originally a translation of a Portuguese book by Garcia ab Horto, to which Clusius appended many notes and woodcuts. He also translated into Latin two works of the same kind, the one from the Spanish of Nicolas Monardes, the other from the Spanish of Christopher Acosta. These were published at Antwerp in 1574. 4. 'Rariorum aliquot Stirpium per Hispaniam observatarum Historia libris duobus expressa,' Antwerp, 1576, 8vo. This work, the

result of his travels in Spain, was illustrated with 229 figures of plants, some of which were from the works of Dodoens. 5. 'Aliquot Notæ in Garcia Aromatum Historiam,' Antwerp, 1582. This little work contained an account of many things he had observed in England, more especially an account of plants, fruits, &c., which had been brought to England by Sir Francis Drake. 6. 'Rariorum aliquot Stirpium et Plantarum per Pannoniam, Austriam, et vicinas quasdam Provincias observatarum, Historia quatuor libris expressa,' Antwerp, 1582, 8vo. This work was of a similar character to the Flora of Spain, and was illustrated with 358 plates. 7. 'Rariorum Plantarum Historia,' Antwerp, 1601, folio. This was a union of the two works on the plants of Austria and Spain, containing many additions from the then living botanists, as Penney, Lobel, Plateau, Dortmann, and others. 8. 'Exoticorum Libri X., quibus Animalium, Plantarum, Aromatum aliorumque Peregrinorum Fructuum Historiæ describuntur,' Antwerp, 1601, folio. He published many other works of less importance, chiefly translations.

CLUVERIUS (CLUWER), PHILIP, was born at Dansig in 1580. His father intending him for the profession of the law, sent him to study at Leyden; but Cluverius showed more disposition for the study of geography and antiquities, and was encouraged in his bias by his acquaintance with Joseph Scaliger. In a journey which he made to Louvain and Antwerp for the purpose of meeting Justus Lipsius, he fell in with some marauding soldiers, who stripped him of everything. On his return to Holland, finding that his father, being dissatisfied with his conduct, had stopped all remittances for his support, he joined the troops of the emperor, and served for two years in Hungary and Bohemia. In the latter country he made the acquaintance of a Baron Popel, who, being arrested by order of the emperor, had written a pamphlet in his defence, which Cluverius undertook to translate into Latin, and published it on his return to Holland. The pamphlet being considered offensive, Cluverius was imprisoned, at the request of the imperial ambassador to the States-General. He was soon after released, and his mother having sent him some supply of money, he set out on his travels to England, where he wrote 'De Tribus Rhæni Alveis,' &c. Returning to the continent, he travelled through France and Germany, and published his 'Germania Antiqua,' folio, Leyden, 1616. It is a work of considerable research, intermixed with much conjecture. Having made a journey into Italy, he was well received there, especially at Rome and Bologna, where his familiar acquaintance with most of the European languages excited great admiration. His next work, 'Siciliæ Antiquæ Libri Duo,' to which he added a short description of Sardinia and Corsica, folio, 1619, has been considered by many as his best work. On his return to Holland from Italy, he suffered severe domestic losses, and his health rapidly declined. It was under these circumstances that he wrote his 'Italia Antiqua,' which was published after his death, a work of great research, but one that requires correction from the more exact observations or discoveries of later geographers and antiquarians. Cluverius wrote also 'An Introduction to Universal Geography,' which has been repeatedly published. He died at Leyden in 1623, forty-three years of age. Danielis Heinsii, 'Oratio in obitum P. Cluverii,' at the end of the 'Introduction to Geography,' Leyden, 1624, gives an account of the principal incidents of Cluverius's life.

COBBETT, WILLIAM, was the son of a farmer and publican at Farnham in Surrey, where he was born in March 1762. He has himself related the incidents of the first portion of his life in 'The Life and Adventures of Peter Porcupine,' first published in 1796. This tract contains a most interesting account of his self-education, carried on under circumstances of difficulty, and with an ardour and steadiness of purpose that has never been surpassed. He was trained up to country work, and so employed from an early age till the autumn of 1782, when on a visit to the neighbourhood of Portsmouth he first beheld the sea, and the next day made an unsuccessful attempt to get employment on board a man-of-war. In May the following year, on the impulse of a sudden thought which took him at Guildford fair, he came to London, and soon, by the assistance of a friend, obtained a situation as copying clerk; but at the end of nine months he went to Chatham, where he enlisted in a regiment of foot, which was sent out to Nova Scotia, and was eventually ordered to New Brunswick. For his excellent conduct he was made a corporal before the regiment left England, and soon after its arrival in America he was raised at once, over the heads of thirty sergeants, to the rank of sergeant-major. In New Brunswick he made his acquaintance with his future wife, then a girl of thirteen, the daughter of a sergeant-major of artillery. His own account of his courtship and marriage is, it may be fairly said, one of the most pleasing moral pictures ever drawn. Cobbett's regiment did not get back to England till the end of the year 1791, when at his earnest request he obtained his discharge, with a testimonial from his commanding officer, declaring that he had served honestly and faithfully for the space of eight years, and was discharged "in consideration of his good behaviour and the services he had rendered the regiment." He now engaged in a proceeding, of his conduct in which and the motives by which he was actuated no intelligible explanation has ever been given; we mean his bringing charges of peacocking against four officers of his late regiment, and then, when a court-martial was appointed to try them, and every arrangement connected with it made in the manner he himself required, declining to come forward

to prosecute. On the day of trial, to the surprise of all concerned, he did not make his appearance, although forty-seven witnesses named by him had been brought up from Portsmouth to London; and the court, in the notion that some accident might possibly have happened to him, adjourned to the third day after. In the meantime search was made for him in all directions, but he had crossed over to France. He remained in that country for six months, and then sailed from Havre-de-Grace for New York, where he arrived in October 1792. About two years after this date he made his first appearance as a public writer in an attack upon Dr. Priestley, then newly arrived in the United States, under the title of 'Observations on the Emigration of a Martyr to the Cause of Liberty, by Peter Porcupine.' This pamphlet attracted much notice, and was followed by a long succession of others in the same violent anti-democratic strain, and with the same signature. The whole were afterwards collected and reprinted in England in 1801, in 12 vols. 8vo. The outrageous recklessness and personality of his invective however at length exposed him to several prosecutions for libel, and the inconveniences in which he was thus involved induced him in June 1800 to quit America for England. On arriving in London he immediately started a Tory daily paper under the title of the 'Porcupine,' but it was discontinued after an existence of only a few months. Upon this he commenced his 'Weekly Register,' which rapidly attained a large circulation, and which he kept up without the failure of a single week from its first publication till his death, a period of above thirty-three years. In the course of this time however it wholly changed its politics, having eventually become the most determined among the assailants of the government and the champions of democracy. The first indications of this change appeared in the course of 1803, but it was not till some years later that the conductor of the 'Register' had completely reversed his original position. In the year 1804 two verdicts had been given against him for libel, in consequence of the first of which (for libels on the Earl of Hardwicke, then lord-lieutenant of Ireland; Lord Redesdale, lord chancellor of that country; and other persons connected with the Irish government) he was fined 500*l.*; and by the second of which he was cast in 500*l.* damages to Mr. (afterwards Lord) Plunket, then the Irish solicitor-general. In 1810 he was again tried on an information at the instance of the government for certain observations in the 'Register' of the 10th of July, 1809, on the flogging of some local militia-men at Ely; and the result was a conviction, on which he was sentenced to pay a fine of 1000*l.* to the king, and to be imprisoned for two years. When he came out of prison he set in motion a new engine for the annoyance of the administration in the series of papers which he called his 'Twopenny Trash,' the circulation of which is said at one time to have amounted to 100,000 copies. In April 1817 however, professedly to escape from the operation of the Six Acts, but partly also, as is believed, in consequence of certain pecuniary embarrassments, he again visited America. While there he still continued the publication of his 'Register' in London, the manuscript being regularly transmitted across the Atlantic. He returned to England in 1819, and soon after commenced a daily paper, which lasted only two months, involving him in further losses. Two other actions for libel immediately followed, in both of which he was cast; the damages awarded in the first (brought by Mr. Cleary) being only 40*l.*, but in the second (brought by Mr. John Wright) 1000*l.* Amidst all these troubles, neither the regularity nor the spirit of his literary labours ever relaxed. His 'Register' was only one of many productions which his untiring and ever-vigorous pen was constantly giving to the world. In 1820 he made his first attempt to get into parliament by standing a contest for the city of Coventry, in which he was defeated. In 1826 he was again unsuccessful in a similar attempt at Preston. In 1829 and 1830 he attracted much attention by a number of political lectures which he delivered in several of the principal towns of England and Scotland. In July 1831 he was again tried on a prosecution for libel, the charge being grounded on an article which had appeared in the 'Register,' and which was alleged to have been published with the intent of exciting the agricultural labourers to acts of violence, and to destroy property. He defended himself on this occasion in a speech of six hours; and, the jury not being able to agree in a verdict, the trial ended in his discharge.

In 1832 Cobbett was returned to the first reformed parliament as one of the members for Oldham. In the course of his parliamentary career he made several effective speeches; but his success in this new field did not come up to expectation, and on more than one occasion he damaged himself by those strange blunders which here and there mark every portion of his history. His death took place unexpectedly, and after a very short illness, on the 18th of June 1835.

A complete catalogue of Cobbett's publications would occupy more space than we can afford. Among those not already mentioned that have attracted most attention, are his 'Year's Residence in America,' 'Emigrant's Guide,' 'Poor Man's Friend,' 'Cottage Economy,' 'Village Sermons,' 'History of the Protestant Reformation in England and Ireland,' 'Advice to Young Men and Women,' 'Grammar of the French Language,' 'English Grammar,' in a 'Series of Letters to his Son,' and his 'Rural Rides,' reprinted from the 'Register.' He also translated from the French Marten's treatise on the 'Law of Nations,' and was the projector and original conductor of the 'Parliamentary History,' which, for some years, bore his name.

BIOG. DIV. VOL. II.

On the subject of the intellectual character of this remarkable man, there is already a more general agreement of opinion than might have been expected, considering the vehement partisanship of the greater portion of what he has written. His mind was one of extraordinary native vigour, but apparently not well fitted by original endowment any more than by acquirement for speculations of the highest kind. Cobbett's power lay in wielding more effectively perhaps than they ever were wielded before, those weapons of controversy which tell upon what in the literal acceptance of the words may be called the common sense of mankind, that is, those feelings and capacities which nearly all men possess in contradistinction to those of a more refined and exquisite character which belong to a comparatively small number. To these higher feelings and powers he has nothing to say; they and all things that they delight in are uniformly treated by him with a scorn, real or affected, more frank and reckless certainly in its expression than they have met with from any other great writer. He cares for nothing but what is cared for by the multitude, and by the multitude, too, only of his own day, and it may be even said, of his own country. Shakspeare, the British Museum, antiquity, posterity, America, France, Germany, are, one and all, either wholly indifferent to him, or the objects of his bitter contempt. But in his proper line he is matchless. When he has a subject that suits him, he handles it, not so much with the artificial skill of an accomplished writer, as with the perfect and inimitable natural art with which a dog picks a bone. There are many things that other men can do, which he cannot attempt; but this he can do as none but himself can or ever could do it.

* COBDEN, RICHARD, was born in 1804, at Dunford, near Midhurst, Sussex. His father, who possessed a small property in land which he himself cultivated, died while Richard was yet young, and he was taken charge of by an uncle, who kept a wholesale warehouse in the city of London, and who placed him in his establishment. He commenced business as a partner in a Manchester printed cotton factory, travelling occasionally for commercial purposes. He visited Egypt, Greece, and Turkey in 1834, and in 1835 he was in North America. About this time he published two pamphlets, 'England, Ireland, and America,' by a Manchester manufacturer; and 'Russia,' by the author of 'England, Ireland, and America.' He had contributed to the establishment of the 'Manchester Athenæum,' and in 1835 pronounced the inauguration discourse.

In 1837 Mr. Cobden stood a contest for the borough of Stockport, but was unsuccessful, and in the same year travelled in France, Belgium, and Switzerland. In 1838 he made a journey in Germany. Soon after his return to England, at a meeting of the Manchester Chamber of Commerce, he advocated the repeal of all taxes on grain, and carried a petition to that effect, addressed to the House of Commons, and very numerously signed. In 1839 about 200 delegates brought up to London a vast number of petitions for the repeal of the corn-laws. Mr. Villiers made a motion for the repeal, which the House of Commons rejected by a very large majority, and immediately afterwards the National Anti-Corn-Law-League was established. In 1841 Mr. Cobden was elected M.P. for Stockport.

The most powerful of the earlier opponents of the corn-laws was Colonel T. P. Thompson, who in 1827 published, in the form of a cheap pamphlet, his 'Catechism of the Corn-Laws,' the substance of which had originally appeared in the 'Westminster Review.' The League, on the 20th of October 1842, announced its "intention of raising 50,000*l.* for the purpose of sending lecturers to every part of the country, and of spreading information on the effects of the corn-laws, by means of pamphlets, &c." Among these pamphlets was one consisting of 'Extracts from the Works of Colonel T. Perronet Thompson, author of the 'Catechism of the Corn-Laws,' selected and classified by R. Cobden, Esq., M.P., and published with the consent of the author,' 8vo, Manchester. Mr. Cobden became one of the lecturers. He attended public meetings in the principal towns throughout the country, and also occasionally in London, and was distinguished above all the others, not less by the extent and precision of his information than by his acuteness of reasoning, his boldness of declamation, and his popular style of oratory. These qualities also gained him much influence in the House of Commons, where he often spoke in support of his object. The struggle for the repeal of the corn-laws was terminated by Sir Robert Peel's memorable speech, and by the royal assent being given, June 26, 1846, to an Act for repealing the duties on the importation of foreign corn.

Mr. Cobden, soon after the passing of the Act, set out on a journey on the continent, and visited successively France, Spain, Italy, Germany, Russia, and Sweden, and was received with great applause at meetings in the principal cities and towns. During his absence in 1847 he was re-elected M.P. for Stockport, and also for the West Riding of Yorkshire. He made his choice to sit for the West Riding, which he still (1856) represents. After the repeal of the corn-laws his political friends set on foot a subscription to remunerate him for his services, and the large sum of 70,000*l.* is stated to have been collected and given to him. Mr. Cobden is an advocate of the ballot, of extension of the suffrage, of shorter parliaments, of financial reforms, and generally of liberal measures. He is a member of the Peace Society, and at the congress in Paris in 1849, at Frankfurt in 1850, and in London in 1851, supported the principles of non-intervention and of

the prevention of war by arbitration between the states interested. When the designs of Russia against Turkey became known, and war was imminent, he still advocated non-interference; and during the war urged the policy of terminating it by concession to Russia. In 1853 he published two pamphlets, 'How Wars are got up in India: the Burmese War,' 8vo, London, and '1793 and 1853, in three Letters,' 8vo, London. In 1855 he published another pamphlet entitled 'What Next?' Some of his speeches have also been published.

COCHIN, CHARLES NICOLAS, called Cochin Fils, a celebrated French designer and etcher, the son of Charles Nicolas Cochin the elder, was born at Paris in 1715. His father, likewise an able engraver, was his instructor, and Cochin early displayed a peculiar aptness for art, and general quickness of ability. In 1749 he made a tour through Italy with the Marquis de Marigny, and in 1756 published a critical account of the various works of Italian art, as a species of amateur's companion in a journey through Italy—'Voyage Pittoresque d'Italie,' in 3 vols. 8vo. The work became popular among his own countrymen: Cochin published a third edition of it in 1773. Some years before the appearance of his 'Voyage Pittoresque' Cochin published an account of the antiquities of Herculaneum, 'Observations sur les Antiquités d'Herculaneum, &c., par M.M. Cochin et Bellicard,' which went through two editions: the second contains many etchings of ancient works of art and other objects of antiquity. Cochin was knight of the order of St. Michel; keeper of the Royal Collection of Drawings; and secretary to the Royal Academy of Painting and Sculpture. He died at Paris April 29, 1790.

Cochin was one of the best and most productive of the French engravers; his prints amount to upwards of 1500, comprising almost every variety of subject, from original designs, and from the works of other masters, chiefly French. Among the best are the fourteen large etchings of the sea-ports of Vernet. A 'Catalogue Détaillé' of his works was published by Jombert in 1770, and copied by Heinicke into his Dictionary, with the addition of some works executed after 1770. Cochin was the author of some other literary works besides those already mentioned. He published in 1757, 'Reflexions sur la Critique des Ouvrages Exposés au Louvre,' and 'Recueil de quelques pièces concernant les Arts, avec une Dissertation sur l'effet de la Lumière et des Ombres relativement à la Peinture;' in 1763, 'Les Minotecnites aux Enfers;' and in 1765, 'Lettres sur les Vies de Slodtz et de Deshayes,' and 'Projet d'une Salle de Spectacle.'

COCHRANE, LORD. [DUNDONALD, EARL OF.]

COCHRANE, CAPTAIN JOHN DUNDAS, R.N., born about 1780, distinguished himself by travelling on foot in a very eccentric manner through France, Spain, and Portugal, and afterwards through Russia and Siberia, to the extremity of Kamchatka. (See 'Narrative of a Pedestrian Journey through Russia and Siberian Tartary, from the Frontiers of China to the Frozen Sea and Kamchatka,' 2 vols. 8vo, Lond., 1824.) He subsequently engaged in some of the mining companies in the New World, and died in Colombia August 12, 1825, at a time, it is said, when he was contemplating a journey on foot through the whole of South America. He tells us in his book, that in January, 1820, immediately before he began his journey to Russia, he made an offer of his services to explore the interior of Africa and the course of the Niger, but this offer was declined by Government. His object, when he left London for St. Petersburg, was to travel round the globe, as nearly as can be done by land, crossing from Northern Asia to America at Behring's Straits. "I also," he adds, "determined to perform the journey on foot, for the best of all possible reasons, that my finances allowed of no other." But at the seaport of St. Peter and St. Paul's, at the end of the Kamchatkan peninsula, he became enamoured of a young lady of the country, and his marriage, together with some other circumstances, induced him to return to England, whither he brought his wife. The eccentricities of this most hardy and indefatigable traveller sometimes approach to insanity, but his book is amusing from its oddness, and contains a good deal of curious information concerning countries rarely visited by Europeans.

COCKBURN, HENRY THOMAS, LORD, a Lord of Session in Scotland, was the son of Archibald Cockburn, of Cockpen, one of the Barons of the Exchequer in Scotland, by a sister of the wife of the first Viscount Melville, and represented an ancient Scottish family which has produced many distinguished members. He was born in 1779, and called to the Scottish bar in 1800. His family connections belonged to the Tory school, but although the Scotch patronage of the crown for many years was dispensed by Lord Melville, Mr. Cockburn in early life adopted liberal opinions.

It was not until November 1830 that any high legal position fell to Mr. Cockburn, when he became solicitor-general for Scotland, upon the promotion of Jeffrey to the attorney-generalship. He had however long before this time risen to considerable eminence in his profession, and was particularly distinguished for the ability of his advocacy, and the influence which he exerted upon the minds of juries. Among other cases in which he was engaged may be particularly mentioned that of the Queensberry title, in which considerable property was at stake. He had also brought himself into notice by gratuitously defending the prisoners charged with treason at Stirling, Glasgow, and other Scotch towns in the year 1818. As a strong proof of his success as an advocate, we may mention that he was engaged to defend Mrs. McDougall, who was put upon her trial at Edinburgh as the accom-

plis of Burke and Hare, and that he obtained her acquittal. During the earlier part of his legal career the arguments of counsel were delivered partly in writing, and partly 'vivâ voce' (as is the case now in the House of Lords). The drawing up of these arguments frequently involved points of the greatest nicety, and several drawn up by Mr. Cockburn attracted the observation of the bench, and even as a young man, his papers on feudal law had met with general approval.

Such a man as Cockburn could not long remain without reaping a more permanent reward than the solicitor-generalship. Accordingly in 1834 he was promoted to the Scottish bench as one of the lords of session, to which three years later was added the further appointment of a lord commissioner of judiciary. Upon the bench Lord Cockburn was surpassed by few in his clear enunciation of law, and in his charges to juries. He was distinguished by a skilful detection of whatever was false in principle or in evidence, as well as by the breadth and grasp of his legal judgments, which were seldom reversed on appeal.

Besides the 'Life' of his friend Lord Jeffrey in 2 vols. (1852), Lord Cockburn published only one small pamphlet, which was entitled 'On the best way of spoiling the beauties of Edinburgh.' He was an early contributor however to the pages of the 'Edinburgh Review;' and it is said that an article from his pen in that review was mainly instrumental in causing a reform in the method by which Scotch juries had been previously chosen.

As a friend, neighbour, and citizen, no less than as a relative, Lord Cockburn was beloved. His death, which happened April 26, 1854, while he was on circuit at Ayr, was preceded by an illness of but a few days' duration. He left a large family by his widow, who is sister of the wives of the late Scotch judges, Lords Fullerton and Dunderrnan.

COCKBURN, ADMIRAL, THE RIGHT HONOURABLE SIR GEORGE, G.C.B., who represented a branch of the same family as Lord Cockburn, was born in 1772, and entered the navy in 1781. Having served on the East India, Home, and Mediterranean stations, in 1795 he co-operated with the Austrian troops in Piedmont, and took part in the capture and blockade of Leghorn. He subsequently received the thanks of the House of Commons for his operations against Martinique, which resulted in that island being ceded as a British colony. In 1812 he was sent as commissioner for reconciling Spain and her transatlantic colonies. He was conspicuous in the hostilities with America in 1813 and 1814. On the cessation of hostilities he was employed to convey Napoleon to St. Helena. Having sat in the unreformed parliament from 1818 to 1830 for Portsmouth, Weobley, and Plymouth, he was returned for Ripon in 1841. He was a Lord of the Admiralty from 1818 to 1828, and again from 1841 to 1846, when he retired from public life. When far advanced in years he inherited his brother's baronetcy, and died in August 1853. (*Gentleman's Magazine*; *O'Byrne's Naval Biography*.)

COCKER, EDWARD. This writer, whose name is so well known in England, was born about 1632, as appears from the inscription to one of the portraits cited by Granger in his 'Biographical History of England.' He was an engraver, and a teacher of writing and arithmetic. Pepys has in his 'Diary' some curious notices of Cocker (Aug. 10 and 11, and October 5 and 7, 1664). He employed Cocker to engrave his "new sliding rule with silver plates, it being so small that Brown that made it, could not get one to do it;" Cocker however did it, and, though so small, without using a magnifying glass. Pepys speaks of finding Cocker "by his discourse very ingenious; and among other things a great admirer of, and well read in the English poets, and undertakes to judge them all, and that not impertinently." He is said to have published fourteen books of exercises in penmanship, some of them on silver plates. One of these is in the British Museum, namely, 'Daniel's Copy Book, &c. &c. Ingraven by Edward Cocker, Philomath. London, 1664.' The matter of these exercises in penmanship consists in great part of descriptions of hell-fire, with fiends (or something very like them) in flourishes. We have also 'Cocker's Urania, or the Scholar's Delight,' without date; and 'Cocker's Morals, or the Muses' Spring Garden,' London, 1694 (either a late edition, or a posthumous work). Soon after his death one of his undoubted works was reprinted by the Hawkins referred to below, under the title of 'The Young Clerk's Tutor Enlarged,' &c., 8th edition, 1675, 8vo. Cocker died before 1675, and certainly later than 1671.

The celebrated work on arithmetic was not published by Cocker himself, but as described in the following title-page:—'Cocker's Arithmetic: being a plain and familiar method, suitable to the meanest capacity for the full understanding of that incomparable art, as it is now taught by the ablest schoolmasters in City and Country. Composed by Edward Cocker, late practitioner in the arts of Writing, Arithmetick, and Engraving. Being that so long since promised to the world. Perused and published by John Hawkins, Writing Master near St. George's Church in Southwark, by the Author's correct copy, and commended to the world by many eminent Mathematicians and Writing Masters in and near London.' The first edition was in 1677; the fourth in 1682; the thirty-seventh in 1720, from which we have copied the title-page; the fifty-fifth in 1758.

Cocker's Arithmetic was the first which entirely excluded all demonstration and reasoning, and confined itself to commercial

questions only. This was the secret of its extensive circulation. There is no need of describing it; for so closely have nine out of ten of the subsequent school treatises been modelled upon it, that a large proportion of our readers would be able immediately to turn to any rule in Cocker, and to guess pretty nearly what they would find there. Every method since his time has been "according to Cocker."

There are two other works which bear the name of Cocker, and both published by the same John Hawkins. (1). 'Decimal Arithmetic, accompanied by Artificial Arithmetic (logarithms) and Algebraical Arithmetic.' London, 1684 and 1685. (2). 'Cocker's English Dictionary,' the second edition of which bears date London 1715. Now, since in 1677 Cocker had been dead some time, as appears by Hawkins's preface to the Arithmetic, and since Kersey's Algebra, on which Cocker's is professedly founded, was published in 1673, it will appear only just possible that Cocker could have lived to have written this work. Again, the Arithmetic was written by a person who understood Latin, as proved by apt quotations from Oughtred and Gemma Frisius: the Decimal Arithmetic is entirely without quotations, though abounding in subjects on which the author of the Arithmetic might be expected to quote. Lastly, to the preface of the Decimal Arithmetic is annexed a very clumsy attempt at a cipher, which seems utterly unmeaning, unless it be considered as wrapping up a confession of authorship. Deciphered, it is as follows: "Amico suo amatissimo Johanni Perkes, Ptochotrophii Pohlensis in Comitatu Wigorniensis Indimagistro. Sir, if you please to bestow some of your spare hours in perusing the following treatise, you will then be the better able to judge how I have spent mine, and if my pains therein may be profitable to the publick I have my wish, but if not, it is not a good thing now indeed I do say so. Sir, I am your humble servant John Hawkins." From all that precedes we are inclined to suspect that Hawkins, being in possession of Cocker's papers, and finding the Arithmetic a successful work, published others of his own in Cocker's name, perhaps with some assistance from the manuscripts of the latter.

* COCKERELL, CHARLES ROBERT, R.A., architect, and professor of Architecture in the Royal Academy, was born in London in 1788. Having passed through the usual initiatory course of instruction, Mr. Cockerell, like most architects, before commencing the practice of his profession, visited the classic fields of art. But his professional tour was far more prolonged and systematic than the customary one. In Asia Minor, as well as in Italy, he made a laborious investigation of the grander architectural remains, and at Egina, Phigalia, &c., he undertook some extensive excavations. Many of the antiquarian fragments obtained in the course of these researches now adorn the British Museum, and the opinions he arrived at respecting several of the more important works which he thus examined have in various ways been given to the public.

Mr. Cockerell early obtained a high place as an architect, and many considerable buildings have been entrusted to him. Among the principal of these are, the New Library at Cambridge (1840), a large and noble pile, the plan of which however has only in part been carried out; the University Galleries at Oxford (1845), also a very extensive and splendid structure, with many peculiarities of design which have not failed to call forth abundant comment from both the classicists and medievalists of that ancient seat of learning; the College at Lampeter, a spacious and very striking gothic edifice; the chapel and speech-room at Harrow; and the Philosophical Institution at Bristol. As architect to the Bank of England, Mr. Cockerell has directed the extensive and successful alterations which during the last twenty years have been made in that masterpiece of Soane's; and he constructed the branch banks at Liverpool, Manchester, &c. He likewise erected the Sun Fire Office, Bartholomew-lane (one of his happiest designs), and the Westminster Fire Office in the Strand; and, in conjunction with Mr. Tite, the London and Westminster Bank. Mr. Cockerell also carried out to completion, with considerable variations however from the original design, especially in the approaches and in the interior, St. George's Hall and Assize Courts at Liverpool. As might be expected from his early pursuits, Mr. Cockerell has always displayed a marked predilection for the classic style of architecture, though in practice he has never servilely adhered to a Greek or Roman type. Indeed he has always introduced so many modifications, whatever might be the order he adopted or the model to which he in the main conformed, as fully to establish his claim to originality and inventive power. His study of Wren perhaps gave him a bold free way of looking at classic forms. In his gothic buildings, such as Lampeter College and the chapel at Harrow, Mr. Cockerell has hardly seemed so much at home. Yet he has in his late years paid great attention to gothic architecture, as shown by his most careful illustrations of the west front of Wells Cathedral, and of the sculptures, &c., of Lincoln Cathedral, of which he has published very valuable monographs, and his 'Architectural Life of William of Wykeham.'

Mr. Cockerell was in 1829 elected A.R.A., in 1836 R.A., and in 1840 he succeeded Mr. Wilkins as Professor of Architecture in the Royal Academy. He is one of the eight foreign associates of the Academy of the Institute of France, member of the Academy of St. Luke, Rome, and of the academies of Munich, Berlin, &c. As professor of architecture, Mr. Cockerell has regularly delivered courses of lectures

full of valuable information respecting the history and theory of architecture. Formerly there used to appear occasionally in the architectural room of the Academy exhibition some architectural studies by Mr. Cockerell, which afforded a large amount of interesting information to the general visitor, as well as to the architectural student: we refer to such works as his 'Tribute to the Memory of Sir Christopher Wren,' being a collection of Wren's principal works drawn to the same scale (exhibited in 1838, and since engraved), and his 'Professor's Dream,' a synopsis of the principal architectural monuments of ancient and modern times, also drawn on one scale; but for several years no production of Cockerell's has been seen on the walls of the academy.

CODRINGTON, SIR EDWARD, ADMIRAL, G.C.B. was born in 1770. He was a grandson of Sir Edward Codrington, first baronet, of Dodington, Gloucestershire. He entered the navy July 13, 1783, and served in several ships till he became lieutenant, May 28, 1793. He served as lieutenant on board the Queen Charlotte, 100 guns, Lord Howe's flag-ship, in the victory over the French fleet off Brest, June 1, 1794, and was appointed to bear to England the duplicate despatches. He was in consequence promoted to the rank of captain, and continued in active service till 1797. He was unemployed from this time till 1805, when he was appointed to the command of the 'Orion,' 74, and was engaged in the battle of Trafalgar. For his services in this victory he was rewarded by a gold medal. He left the 'Orion' in December 1806, and in November 1808 was appointed to the command of the 'Blake,' 74, in which ship he sailed under Lord Gardner in the expedition to Walcheren, and was thanked for his services in forcing the Schelde in August 1809. In 1810, 1811, and 1812, Captain Codrington was employed on the coasts of Spain, in the defence of Cadiz and Tarragona, and in co-operating with the Spanish patriots in Catalonia. In January 1813 he returned to England.

In 1814 Captain Codrington sailed to North America, and while there was promoted to the rank of rear-admiral, and was appointed captain of the fleet under Sir Alexander Cochrane. He took part in the attack on New Orleans. At the conclusion of the war with the United States he returned to England, and was created a knight commander of the Bath, January 2, 1815. He attained the rank of vice-admiral July 10, 1821.

Sir Edward Codrington was appointed, November 1, 1826, commander-in-chief of a squadron in the Mediterranean destined to observe the Turco-Egyptian fleet, and hoisted his flag on board the 'Asia,' 84. He was joined by a French and a Russian squadron, and the battle of Navarino took place October 20, 1827; when the Turco-Egyptian fleet, consisting of 81 ships of war, was almost entirely destroyed. For this victory Sir Edward Codrington was advanced to the dignity of knight grand cross of the Bath; but as there was much doubt among politicians as to the propriety of destroying this fleet, and the Duke of Wellington admitted that it was an "untoward event," Sir Edward was recalled from the Mediterranean in April 1828. In 1832 he was elected M.P. for the borough of Devonport, and was re-elected in 1835, and again in 1837. He was of liberal politics, and very popular. In 1837 he attained the full rank of admiral, and on the 22nd of November 1839 was appointed commander-in-chief at Portsmouth, when he resigned his seat as a member of parliament. He occupied his station at Portsmouth for the usual term of three years. He had a good-service pension of 300*l.* a year. He died in London, April 28, 1851.

* CODRINGTON, SIR WILLIAM JOHN, K.C.B., was born in 1800. He is the eldest surviving son of Admiral Sir Edward Codrington. He entered the army in 1821, and in 1836 became lieutenant-colonel in the Coldstream Guards. In 1846 he attained the rank of colonel, and in 1854 that of major-general. During the whole of this period he had not been in any actual war-service.

When the British army was sent out to Turkey in 1854, Sir William Codrington accompanied it as a spectator. Happening to be at Varna immediately before the sailing of the expedition to the Crimea, Lord Raglan appointed him to the command of the first brigade of the light division, which had just then become vacant by the appointment of General Airey to the situation of adjutant-general of the Army of the East. Sir William led this brigade at the battle of the Alma with great steadiness as well as gallantry. When visiting the outlying pickets of his brigade about five o'clock in the morning of the battle of Inkermann, he became aware of the near approach of the Russians, and immediately rode back to turn out his brigade, and to give the first alarm. His bravery during the battle was noticed by Lord Raglan, and when Sir George Brown in consequence of a wound received that day was obliged to retire to Malta, Major-General Codrington was selected by Lord Raglan to take the command of the light division during his absence. After the final retirement of Sir George Brown from the Crimea, Major-General Codrington succeeded him in the command of the light division, and in that situation had the chief direction of the unsuccessful assault on the Redan at the taking of Sebastopol, September 8, 1855. After the resignation of General Simpson he was appointed commander-in-chief of the British army in the Crimea, with the local rank of general. For his services in the Crimea he was made a knight commander of the Bath.

COEHORN, MENNON, BARON DE, a celebrated Dutch engineer,

who was born in 1632. He commenced his military career at an early age, and spent the leisure which the intervals of active duty afforded in improving the art of fortifying places, with the view of diminishing the inequality which, by the inventions of his contemporary Vauban, began then to be felt in the means of attack and defence. The services which Coehorn rendered to his country, both as an engineer and a commander, at a time when the defence of its military posts was an object of the first importance, procured for him the most honourable appointments which a soldier can attain. He arrived at the rank of general of artillery, and was made director-general of fortifications and governor of Flanders.

At the siege of Namur in 1692, Coehorn gallantly defended the fort which he had before constructed for the purpose of strengthening the citadel of that place; but being dangerously wounded he was at length compelled to surrender. Vauban, who conducted the operations of the attack on this occasion, rendered full justice to the talents and valour of his rival.

Coehorn was engaged at the attack of Trarbach, Limburg, Liège, and at that of the citadel of Namur, which three years before he had defended. In the year 1703 he was employed at the siege of Bonn, where, in three days, his heavy and well-directed cannonade caused the surrender of the place. Soon afterwards he forced the French lines at Hanau, and was appointed with his army to keep in check the Marquis de Bedmar on the right bank of the Scheldt. This was his last service; in the following year (1704) he died at the Hague, at the age of seventy-two.

In 1685 Coehorn published what are called his 'Three Systems of Fortification'; they are adapted to ground elevated but from three to five feet above the surface of water, and consequently they may be considered as applicable only to the towns of Holland. He was appointed to repair or reconstruct the fortifications of Nimeguen, Breda, Mannheim (since destroyed), and Bergen-op-Zoom. The siege of the last place in 1747, by its duration and the losses which the besiegers sustained in its progress, attests the merit of the system on which the works were constructed.

CÆLIUS, or rather CÆLIUS ANTIPATER (LUCIUS), wrote a history of the second Punic war, in a work bearing the name of 'Annals,' and extending to at least seven books. Some indeed are of opinion that the history embraced a much wider period, beginning with the first Punic war, and including the times of the Gracii. It was dedicated to L. Ælius, the same person to whom the poet Lucilius dedicated his 'Satires.' From his cognomen Antipater he was probably of Greek origin. The precise period of his birth or death cannot be fixed, but he is called by Cicero ('De Leg.' i. 2) the contemporary of C. Fannius Strabo, himself an historian, and we know that Fannius was with Scipio at Carthage, in B.C. 146, and consul in B.C. 122. He was also (Cicero, 'De Divinat.' i. 26) a contemporary of Caius Gracchus, who was quaestor in B.C. 126, tribune for the first time in B.C. 123, and murdered in B.C. 121. Lastly, the orator, L. Crassus, born B.C. 140, was one among many pupils of Cælius. We shall therefore not be very wrong if we suppose Cælius to have been born about the middle of the second century B.C.

The historical writings of Cælius were highly valued by his countrymen in the time of Cicero, who assigns to him the credit of having surpassed his predecessors in historic composition by the dignity and eloquence of his style. Though he wanted that knowledge of the jurisprudence of his country which is essential to an accurate historian, yet he was a man of an inquisitive temper, and seems generally to have the advantage in point of credibility where he differs from the historians of the same period. Marcus Brutus so highly prized his writings, that he made an epitome or abridgment of them, as he had before done of the histories composed by Polybius and Fannius. But the more complete work of Livius threw all the historical works of his predecessors into oblivion. Cælius was afterwards seldom read, except by antiquarians and those who sought in his writings examples of quaint words and obsolete phraseology; it is to the grammarians therefore that we are chiefly indebted for the fragments of his works that still exist. These fragments, together with those of other Roman historians, may be found in an appendix to Cort's and Havercamp's editions of Sallust. They have also been edited by Krause ('Vite et Fragmenta Veterum Historicorum Romanorum,' Berol., 1833.) One of the most interesting among them is that in which he bears testimony to having seen a merchant who had sailed from Spain as far as Ethiopia, by which he probably meant the coast of Guinea. It is Cælius too who gives the most direct evidence in favour of Hannibal's route across the Alps having been by the Little St. Bernard. Two copious dissertations on L. Cælius, by B. A. Nauta and W. G. Van Prinsterer, will be found in the *Annals of the Academy of Leyden* for 1821.

COELLO, CLAUDIO, a celebrated Spanish painter, born at Madrid in the earlier half of the 17th century. His father Faustino Coello, who was a Portuguese bronze-worker, wished to bring up his son to his own business, and placed him with Francisco Rizi to learn to draw. Rizi however, who soon perceived the great abilities of young Coello, persuaded his father to allow him to become a painter. By the instruction of Rizi, and by copying a few of the pictures of Titian, Rubens, and Van Dyck in the palace at Madrid, Coello became a very able painter, and produced several excellent altar-pieces while still with

Rizi. He executed also several works in fresco in company with Josef Donoso, especially on the occasion of the marriage of the king Charles II., with Maria Louisa of Orléans. In 1690 he was appointed cabinet painter to that king in the place of Carreño, deceased, with a salary of twenty ducats per month.

In consequence of the death of Rizi, Coello was ordered by the king to paint the great altarpiece for the sacristy of the Escorial, in place of one which had been commenced by Rizi. The subject was the procession and ceremony of the Collocation of the Host on the altar of the Sacristy, 'Colocacion de la Santa Forma,' which took place in 1684 in the presence of Charles II. and his officers of state: the picture contains upwards of fifty portraits, and was completed by Coello in about three years, to the utmost satisfaction of the king. It is very large, and contains in the group of persons who form the grand procession of the Collocation, the portraits of the king and all the principal nobility of his court, executed in the most masterly manner. It is Coello's masterpiece, and one of the finest productions of the Spanish school, combining the design of Cano, the colouring of Murillo, and the effect of Velasquez. In Cumberland's opinion, Coello's style very much resembles that of Paul Veronese. Coello is said to have died of jealousy and vexation in 1698, in consequence of the arrival of Luca Giordano at Madrid by the invitation of the king to paint in fresco the great staircase and other principal parts of the Escorial. Giordano arrived in May 1692, and Coello died eleven months afterwards, having from the time of Giordano's arrival, with one exception, resolutely adhered to a determination to paint no more. The 'Martyrdom of St. Stephen,' for the Dominican convent at Salamanca, was the only work that he finished, of all he had on hand, after the arrival of Giordano at Madrid. It is however to be observed that such stories are very common respecting eminent painters, and that they seem to be transferred from one to another with little ceremony. It may very well have happened that Coello's abstinence from painting for the eleven months preceding his death arose from illness; and illness rather than mortification seems to us a much more likely explanation of such a course.

There are several altarpieces and frescoes by Coello at Madrid, and some at Saragoza and other places.

(Cean Bermudez, *Diccionario Historico, &c.*; Cumberland, *Anecdotes of Eminent Painters in Spain.*)

COELN, WILHELM VON, or William of Cologne, a celebrated old German painter, of the latter part of the 14th century, called also Meister Wilhelm. There are several documents which satisfactorily prove the existence of this painter, but there are no data by which any of his works can be identified: many paintings in distemper of the old Cologne school are attributed to him, upon no other grounds than conjecture; but none but the best productions of that school are awarded to him.

The exact date of his birth is not known, but the place appears to have been Herle, a village near Cologne, whence he is also called in some documents Wilhelm or Wilhelmus de Herle. He was settled in Cologne, with his wife Jutta, as early as 1370; and there is a passage in the *Annals of the Dominican monks of Frankfurt*, which testifies to his great reputation: ten years later, it says—"in that time, 1380, there was at Cologne a most excellent painter, to whom there was not the like in his art; his name was Wilhelm, and he made pictures of men which almost appeared to be alive." There were celebrated painters at Cologne however long before this period, for Wolfram of Eschenbach, who lived at the commencement of the 13th century, in speaking, in his poem of 'Parzival,' of the beauty of a knight on horseback, says that no painter of Cologne or Maastricht could make a better picture than the knight on horseback was. Of the works attributed to Meister Wilhelm, the following are the principal:—the picture over the tomb of Cuno von Falkenstein in the St. Castors-Kirche at Coblenz, painted in 1383; the large altarpiece of the church of St. Clara at Cologne, which is now in one of the chapels of the cathedral; it is in twenty-six compartments illustrating the life and passion of Christ; the Santa Veronica, formerly in the Boisseree collection, now belonging to the King of Bavaria, and in the Pinakothek at Munich, and of which there is a beautiful lithograph by Strixner; and a Crucifixion, and a half-length Madonna and infant Christ, in the Wallraf Museum at Cologne.

Meister Wilhelm was also supposed to have been the master of the so-called Dom-bild, or Cathedral-picture, which was formerly the altarpiece of the chapel of the Rath-haus of Cologne, but is now in the cathedral, and is at present generally attributed to Meister Stephan, the supposed scholar of Meister Wilhelm. There are also in the Pinakothek at Munich (cabinet I.) four other pictures of various saints, mostly on gold grounds, besides the Santa Veronica, attributed to this painter. They are all remarkable for richness of colour and extreme diligence of execution, in the heads in particular, which all have a true nobility of expression. Technically, likewise, they are very remarkable works; for though in water-colours, in a species of tempera, they are equal, or even in some respects superior, in impasto, to the best of oil paintings, and very similar in effect: they are however Gothic in design; and in the extremities, especially the fingers, are totally devoid of proportion and modelling. Except for this last-mentioned defect, they would bear a perfect resemblance to the works of the so-called school of Van Eyck; for even in the vehicle in which

the colours have been mixed there is no apparent difference, and, as already stated, that they are by Wilhelm von Cöln is a mere conjecture.

There is no other record of STEPHAN VON CÖLN, the Dom-bild Meister, than a note in the journal 'Tagebuch' of Albrecht Dürer, which attributes this celebrated picture to him. It was painted in 1410, and is the most valuable picture of the old school of Cologne. It consists of a centre and two revolving wings, painted on both sides. The outside of the wings represents the Annunciation; the centre represents the Adoration of the Three Kings; and on the interior of the wings are patrons of Cologne, St. Gereon and St. Ursula, with their companions in martyrdom. There are three other works of this school, which from their similarity of style are attributed to this master: the altarpiece formerly in the Benedictine Abbey of Heisterbach, near Bonn, now existing only in parts; the altarpiece formerly in the church of St. Lawrence, at Cologne, likewise divided into parts and scattered; and a picture of the Madonna and Child, with Angels, in a private collection at Cologne.

(Florillo, *Geschichte der Zeichnenden Künste in Deutschland*, &c.; Passavant, *Alt kölnische Malerschule*, in his 'Kunstreise durch England und Belgien'; Dillis, *Verzeichniss der Gemälde in der Königl. Pinakothek zu München*.)

COKAINE, or COKAYN, SIR ASTON, was born in 1608, at the country-seat of his father, a Derbyshire esquire of old lineage and considerable property. After having been educated at both universities, he was entered for form's sake in the inns of court, and travelled on the Continent. He was a Roman Catholic and royalist; and both of these characters exposed him to much suffering in the civil war. In the latter part of his life he was obliged to part with his estates, reserving a small annuity for his support. He died at Derby in 1684. He published four plays, which, with other poems, were collected, in 1669, in two volumes, small octavo, now very rare. The plays and the poems are equally worthless; but Sir Aston's name deserves some notice for his close intimacy with the dramatic poets of his time, and for the information furnished, in regard to the history of the drama, by those commendatory verses which make up a large proportion of his compositions. It has been justly regretted that he did not set down in distinct prose the facts of which he was in possession, instead of hinting at them briefly and obscurely in snatches of wretched doggerel.

COKE, EDWARD, was born at Mileham, in the county of Norfolk, on the 1st of February, 1551-52. He was the only son of Robert Coke of Mileham, and Winifred, daughter and one of the heirs of William Knightley, of Morgrave-Knightley, in the same county. His father, who was a benchler of Lincoln's Inn, died in the year 1561, when Edward Coke was ten years old. Before that event he had been sent to the free grammar-school at Norwich, whence in September 1567 he removed to Cambridge, and was admitted as a fellow commoner at Trinity College. After having spent three years at the university, he went to London to commence his legal education. According to the practice of that time, he took the first step of his legal course by becoming a member of Clifford's Inn, a house of Chancery, or inferior inn, dependent upon the Inner Temple, and was admitted into the latter society April 24, 1572. On the 20th of April 1578 he was called to the bar. During the continuance of his studies in the Inner Temple he is said to have greatly distinguished himself in the exercises called Meetings and Readings, which constituted a necessary part of the education of an advocate in former times, and which excited a great degree of interest and emulation among the members of the societies called Inns of Court and Chancery.

In the course of the year after his call to the bar, the society of the Inner Temple appointed him reader at Lyon's Inn; and the intelligence and learning displayed by him in the conduct of the exercises at which he presided in this capacity raised for him a high reputation as a lawyer, and opened the way to that extensive practice at the bar which he acquired with a degree of rapidity almost without a parallel in the history of the profession. Lloyd, in his 'State Worthies,' says that "his learned lecture so spread forth his fame that crowds of clients sued to him for his counsel." In the next term after he was called to the bar he argued a case of much nicety and importance, known to lawyers by the name of Lord Cromwell's Case, which he says, in his own report of it (4 Rep. 146), "was the first cause that he moved in the King's Bench." About three years afterwards he was associated with Popham, the solicitor-general, in arguing before the chancellor and the twelve judges in the case of Edward Shelley, where the important rule in the law of real property, which has since become celebrated as the 'Rule in Shelley's Case,' was laid down so distinctly that it has taken its name from this case, though the rule itself is of much higher antiquity. From that period until he became solicitor-general his practice was enormous: it appears from the reports of that time that there was scarcely a single motion or argument before the court of King's Bench in which he was not engaged. Professional honours were the consequence of this large business in the courts: in 1586 he was chosen recorder of Norwich, and for years afterwards was called to the bench of the Inner Temple. In January 1591-92 the corporation of London having with much difficulty and at the expense of an annuity of 100*l.* procured the reaignation of Serjeant Fleetwood, unanimously elected Coke their recorder; but he resigned that office

in June 1592, on being appointed solicitor-general. In the same summer he became reader of the Inner Temple, and had delivered several readings on the Statute of Uses to a large audience, consisting of not less than 160 members of the society, when the appearance of the plague compelled him to leave London abruptly for his house at Huntingfield in Suffolk. Such was the honour and respect in which he was held by the profession, that on this occasion, as he records in his 'Notes,' he was accompanied on his journey as far as Romford by a procession composed of nine benchers and forty other members of the Inner Temple. In March 1594 he was appointed attorney-general, and as the office of solicitor-general continued vacant until the close of the following year, the duties and labours of both offices during that interval devolved upon him.

At this period originated the animosity between Coke and Bacon which prevailed with little intermission during the life of the latter. As soon as the office of attorney-general became vacant, upon the removal of Sir Thomas Egerton to the seals, the Earl of Essex used his most strenuous efforts to induce the queen to bestow that place upon Bacon, instead of promoting Sir Edward Coke from the inferior office of solicitor-general. The letters of Bacon to Essex and others, with relation to this intrigue, abound with sarcastic and contemptuous expressions respecting Coke, whose high reputation and great experience seemed to point him out as a fitter man for the office than his rival, whose practice at the bar was never extensive, and who was then scarcely known in the courts. The state services imposed upon the attorney-general at the end of Elizabeth's reign were extremely laborious. The severity of the laws recently introduced against Roman Catholics had occasioned a succession of plots by foreign adventurers against the person of the queen, the investigation of which was necessarily committed to the attorney-general. The treasons of Lopez, of Patrick Cullen, of Williams and Yorke, and numerous others of inferior moment, occurred about this period; and the business of constant examination at the Tower, added to his Star-Chamber duties and his undiminished practice in the common-law courts, must have imposed a weight of labour and responsibility upon Coke which no mind of common activity and energy could have undergone. Whole volumes of examinations in these cases, taken by himself and written with his own hand, which are still preserved at the State Paper Office, sufficiently attest his zeal and assiduity in the service. In February 1593 Coke, being at that time solicitor-general, was elected without solicitation on his part, and without opposition, a member of parliament for his native county of Norfolk. At the meeting of this parliament he was chosen Speaker of the House of Commons.

In the year 1582 Coke married the daughter and heiress of John Paston, Esq., of Huntingfield in Suffolk, through whom he became connected with several families of great opulence and importance, and with whom he received a fortune of 80,000*l.* By this lady he had ten children. She died in June 1598. In the month of November in the same year Coke contracted a second marriage with the widow of Sir William Hatton, daughter of Thomas Lord Burleigh, and grand-daughter of the lord high treasurer, which, though an advantageous alliance in point of connection and property, was by no means a source of domestic happiness. The marriage itself involved all the parties concerned in it in considerable embarrassment; for having taken place without licence or banns, Coke and his lady, together with the clergyman, Lord Burleigh, and all who were present at the ceremony, were cited to appear in the Archbishop's Court; and it was only in consequence of their making a full submission, and pleading their ignorance of the law (a singular excuse in Coke's mouth), that they escaped the sentence and penalties of excommunication.

Sir Edward Coke held the office of attorney-general until the death of Queen Elizabeth; and having always been favourable to the title of James I., co-operated cordially with Cecil and the other members of the late queen's council in making the necessary arrangements for the peaceable accession of the king of Scotland to the crown. James upon his arrival in London received him into his full confidence and favour, and continued him in his office of attorney-general.

Coke's sound judgment and extensive legal knowledge, united with his fervent attachment to Protestantism, rendered him a serviceable officer of the crown in the various proceedings against the Roman Catholics at the close of Elizabeth's reign and the beginning of that of James I. In the examinations respecting the several assassination-treasons, which have been already mentioned, as well as that of Squire in 1598, of the Raleigh conspiracy in 1603, of the Gunpowder Plot in 1605, and of numerous other treasonable and seditious movements imputed to the Catholics during the period that he filled the office of attorney-general, he engaged with a zeal and ardour far beyond mere professional excitement; and the temper displayed in his speeches and general conduct on the several trials is much more that of a religious partisan than of a legal advocate. It is common with Roman Catholic writers to attribute to him the utmost barbarity in the use of the rack and the general treatment of prisoners under examination. That he, who in his writings forcibly condemns the use of torture, was nevertheless in his official character the constant instrument of the crown for applying this odious process, is beyond all question; but it must be remembered that what he wrote on this subject was written long after the period of which we are now speaking, in the dawn of a better order of things; and that the use of the rack for

discovering state secrets was common throughout Europe in his time, and had been in common practice in England for centuries before he was born. There is no satisfactory proof that he was coarse and cruel in his conduct towards prisoners under examination, and on the contrary, Father Cornelius, the Jesuit, who was repeatedly examined by Coke, said he found him "omnium hominum humanissimus;" and Garnet, in his intercepted correspondence, and also on his trial, admits that he was constantly treated by him with courtesy and kindness. At the same time, there is no doubt that as the advocate of the crown on trials for state offences, he displayed a degree of intemperance and asperity not only shocking to the feelings of readers familiar only with the more civilised character of criminal proceedings at the present day, but strongly offensive even to contemporaries.

With the trials of the conspirators in the Gunpowder Plot in 1606, the career of Sir Edward Coke as an advocate closed. In the month of June in that year he received his appointments as Chief Justice of the Common Pleas. He retained the situation upwards of seven years, and in the discharge of the common judicial duties at this period, his profound learning and unwearied industry procured him the highest reputation. At this time too, though he has sometimes been reproached for a haughty and unconciliating deportment on the bench, the bitterness of temper which he displayed at the bar appears to have been suppressed or softened; and in several constitutional questions of the highest importance which occurred while he was chief justice of the Common Pleas, and in which he resolutely opposed the views of the king, especially in the conflicts between the ecclesiastical jurisdictions and the courts of common law, and in his resistance to the encroachment of prerogative on the subject of royal proclamations, he displayed great integrity and independence. With a view to subdue his uncompromising disposition, he was promoted to the chief justiceship of the King's Bench, in October 1613, and a few days afterwards, in consequence of a special order from the king, took his seat at the board as a privy councillor. In the following year he was elected high steward of the University of Cambridge. But the project of making the chief justice "turn obsequious" by his advancement, which was no doubt entertained by the court, and was expressly avowed by Bacon, altogether failed. In the case of Peacham, who was prosecuted for treason in the year 1615, for having in his possession a sermon supposed to contain sedition, written by him, but never preached or published, Coke, after long hesitation to deliver what he quaintly called an "auricular opinion," seems at last to have declared that the offence was not treason. His exertions in the prosecution of the murderers of Sir Thomas Overbury in the same year, though praised by Bacon in conducting the case as attorney-general, gave displeasure to the king; and his independent conduct in the case of Commendams, which occurred in 1616, finally determined the court to remove him from his office. The transaction was this: a serjeant-at-law, in the discharge of his duty as an advocate in the Court of Common Pleas, was supposed to have used matter in his argument which tended to question the royal prerogative; upon this, the king required the judges to proceed no further in the case without his warrant. The twelve judges conferred upon this message, and resolved that in a common dispute between party and party it was their duty to proceed notwithstanding the king's mandate. Upon this they were summoned to the council-table, and personally reprimanded by the king; and all of them, excepting the lord chief justice, acknowledged their error, and craved pardon for their offence upon their knees. Sir Edward Coke, on the contrary, after craving pardon for any formal errors which he might have committed, boldly justified his opinion upon the substantial point, contending that the king's command for staying the proceedings was a delay of justice, and consequently against the law, and contrary to the judges' oath. After much discussion, the lords of the council proposed the following question to the judges:—"Whether in a case where the king believed his prerogative or interest concerned, and required the judges to attend him for advice, they ought not to stay proceedings till his Majesty had consulted them?" All the judges at once answered in the affirmative, except Lord Coke, who only said "that, when the case happened, he would do that which should become an honest and just judge."

The court now despaired of bending the stubborn integrity of the chief justice, and determined at all events to displace him. Accordingly, on the 26th of June 1616, as a preliminary to his removal, he was summoned before the council, and charged with several frivolous accusations, some of them founded upon alleged malversations while he was attorney-general, to all of which he returned distinct answers. Four days afterwards he was again summoned to appear before the council, upon which occasion he was reprimanded, sequestered from the council-table during the king's pleasure, enjoined not to ride the summer circuit as judge of assize, and ordered to employ his leisure in revising many "extravagant and exorbitant opinions" set down in his 'Book of Reports.' In the course of the vacation he was again summoned before the council to answer a list of twenty-eight objections to doctrines contained in his 'Reports,' which, a contemporary writer observes, "were either so weak in themselves, or so well answered, that they were readily reduced to nought." ('Chamberlain's Letter to Sir D. Carleton,' 29th of October, 1616.) In November 1616 he received his writ of discharge from the office of chief justice, and

was succeeded by Sir Henry Montague, who was expressly warned by the lord-chancellor Egerton "to avoid the faults of his predecessor, who had been removed for his excessive popularity."

From causes not very distinctly explained in the letters and histories of the day, which probably were connected with an intrigue for the marriage of his daughter to Sir John Villiers, afterwards Viscount Purbeck, Sir Edward Coke, though he never afterwards filled a judicial situation, was at no long interval restored to a certain degree of royal favour. In September 1617 he was reinstated as a member of the privy council, and in July 1618 he was appointed a 'commissioner for the exercising the office of lord high treasurer of England,' jointly with Archbishop Abbott, Lord Chancellor Bacon, and several others. (See Devon's 'Pell. Records,' temp. Jac. I.) In the course of the next three years he was employed in several other commissions of a public nature, and until the year 1620 he was constant in his attendance at the board. In the parliament which assembled in that year he was returned as a member for the borough of Liskeard in Cornwall. In this parliament he distinguished himself as one of the most able and zealous advocates of the liberal measures which were proposed. He became a strenuous opponent of the pernicious monopolies by which at that period the freedom of trade was fettered, and took an animated part in that struggle between the prerogative pretensions of James and the freedom of debate, which ended in the celebrated resolution of the Commons, "that the liberties, franchises, privileges, and jurisdictions of parliament are the ancient and undoubted birthright and inheritance of the subjects of England." During the year 1621 he attended only three times at the privy council; and on one of those occasions, namely, on the 5th of October 1621, he seems to have appeared only to inform the board that he had induced one Johnstone to give up a grant which he had obtained from the king, "both a grievance to the subject, and a disservice to the state;" which information he desired might be recorded in the council register. ('Council Books.') His adherence to the popular or country party gave great offence to the court, and he was accused of various offences and malpractices. The king at this period was so incensed against him that before he would grant him warrant for a general pardon at the end of 1621, he expressly commanded the privy council to consult upon the means of excepting Sir Edward Coke from the benefit of it; and on the 27th of December of that year Coke was arrested and committed to the Tower, where he remained a close prisoner until the 6th of August 1622. While he was in the Tower proceedings were instituted against him both in the star-chamber and the court of wards, the precise nature and issue of which cannot now be ascertained. Upon his enlargement from the Tower, he was ordered to confine himself to his house at Stoke Pogis, and not to repair to the court without express licence from the king. After his disgrace on this occasion, he was never again restored to the council-board. At the end of 1623 he was appointed a commissioner, together with Sir William Jones, one of the judges of the Common Pleas, and two other persons, to inquire into the church establishment in Ireland. That he was on the point of going on this mission appears from the fact that a passport dated January 16th, 1623-24, was actually granted by the council. Some accident however prevented his departure.

In the first parliament of Charles I., called in April 1625, Sir E. Coke was again returned as one of the knights of the shire for the county of Norfolk, as he says in his Note, "sine aliqua motione aut petitione inde a me prebita." At the commencement of this parliament he adopted a moderate tone. He dissuaded the house from insisting upon grievances, and urged conciliatory measures; saying, that "as it was the very beginning of the new king's reign, there could be no grievances as yet." But this disposition to peace was overcome by the determined tendency of the crown to arbitrary measures; and the king being unable to obtain any answer to his demand of a subsidy, but repeated remonstrances against grievances, abruptly dissolved the parliament. Compelled however by his pecuniary wants, to assemble a new parliament in the course of the same year, he previously appointed Sir Edward Coke and three other popular leaders sheriffs of counties, in order to prevent their serving as members. Coke, having been in this manner named Sheriff of Buckinghamshire, was again returned as knight of the shire for Norfolk; and though in consequence of his shrievalty, he did not take his seat in that parliament, no new writ was issued to supply his place, and it was considered that he was *de facto* a member of the house. He mentions this circumstance in his 'Fourth Institute,' p. 48, though he does not state it to have been his own case; and says, that "having a subpoena out of chancery served upon him, he had his privilege of parliament allowed unto him by the judgment of the whole House of Commons." On occasion of the third parliament summoned by Charles I. in March 1628, Sir Edward Coke was returned for two counties, Buckingham and Suffolk; but he tells us that "he chose the former, because he resided there, and because his election for that county took place first." In this parliament, though now in his seventy-ninth year, this extraordinary man asserted and defended the constitutional rights of the people of England with all the energy of youth, and all the sagacity of age. By his advice, and with his active co-operation and assistance, which his extensive and varied experience rendered particularly valuable, the celebrated Bill of Rights was framed; and by his perseverance and reasoning the lords were, after many conferences, induced

to concur in the measure, which was, at last, and after many ineffectual attempts at evasion, reluctantly assented to by the king. One of the last acts of his public life was his spirited denunciation of the Duke of Buckingham as the cause of all the misfortunes of the country. As a proof of the earnest feelings by which he was impressed, Rushworth records that, on this occasion, "Sir Edward Coke, overcome with passion, seeing the desolation likely to ensue, was forced to sit down when he began to speak, through the abundance of tears." At the close of the session of parliament in March 1629, the growing infirmities of advanced age induced him to withdraw from public life, and to spend the remainder of his days in retirement on his estate at Stoke Pogis, in Buckinghamshire. Still it appears that his vigorous and active mind was not without employment; and the last years of his life are said to have been occupied by the revision of the numerous works which he left behind him.

The last entry in his note-book, written with almost as firm a hand as he wrote at the age of forty, records the following incident, which may possibly have been the cause of his death:—

"Memorandum. Die Jovis, the iiird of May 1632, riding in the morning in Stoke, between eight and nine of the clocke to take the ayre, my horse under me had a strange stumble backward, and fell upon me (being above eighty years old), where my head lighted nere to sharpe stubbes, and the heavy horse upon me. And yet, by the providence of Almighty God, though I was in the greatest danger, yet I had not the least hurt,—nay, no hurt at all. For Almighty God saith by his prophet David, 'The angel of the Lord tarrieth round about them that feare him, and delivereth them.' Et nomen Domini benedictum, for it was his work!"

He died on the 3rd of September, in the following year, repeating with his last breath the words, "Thy kingdom come, thy will be done;" and was buried in the family burying-place of the Coke family in the church of Titchshall, in Norfolk.

The most celebrated of Sir Edward Coke's works is the treatise commonly known by the name of 'Coke upon Littleton, or the First Institute.' It consists of a minute and laborious commentary upon the text of Littleton's 'Tenures,' in the course of which almost the whole learning of the common law, as it existed in his time, is digested and explained. This book has ever since the time of Lord Coke to the present day been considered as a work of the highest authority in the municipal and constitutional law of England. The 'Second Institute' contains notes on several ancient statutes; the 'Third Institute' is a treatise on criminal law; and the 'Fourth Institute' treats of the origin and jurisdiction of different courts. Besides these works, Sir Edward Coke was the author of a treatise on copholds, entitled 'The Complete Copyholder,' and a 'Reading on Fines.' He also published a collection of Reports, which are still of great value to the profession, and at the time of their appearance formed an epoch in the history of the law. Sir Francis Bacon speaks of this produce of the industry and learning of his great rival in terms of high and deserved commendation; and justly ascribes to the Reports the praise of having preserved the vessel of the common law in a steady and consistent course; "For the law," says he, "by this time had been like a ship without ballast, for that the cases of modern experience are fled from those that are adjudged and ruled in former time." It would have been well for the critical fame of Coke had he spoken in as honourable terms of his greater rival's philosophical labours.

(Many of the dates and incidents in this sketch of Sir E. Coke's life are taken from some characteristic memoranda in his own hand-writing prefixed to a volume of Notes among the Harleian manuscripts in the British Museum, No. 6687. It is remarkable that these Notes had not been referred to by any of Coke's numerous biographers before the publication of this biography in the 'Penny Cyclopædia'.)

COKE, J. W. [LEICESTER, EARL OF.]

COLBERT, JEAN BAPTISTE, born in 1619, at Rheims, was brought up to business. He was first employed at Lyon, in a commercial house, and afterwards went to Paris, where he was introduced, about 1648, to Mazarin, who employed him first as an amanuensis, but afterwards made him intendant or steward of his vast fortune. Mazarin appointed him his executor on his death-bed in 1661, and recommended him to the king as a man deserving all his confidence. Louis XIV., on appointing Colbert contrôleur-général des finances, had many conferences with him, which led to the dismissal and imprisonment of Fouquet, the superintendent of the finances, who had assisted in dilapidating the resources of the state to serve the cupidity of Mazarin. On the trial there was a manifest anxiety on the part of the court and of Colbert to have Fouquet condemned to death, but D'Ormesson, one of the reporting judges, stood firm; he found much abuse and mal-administration, but no proof of peculation. Fouquet was condemned to banishment, and his property was confiscated. Louis XIV. aggravated this sentence into imprisonment for life in the citadel of Pignerol.

Colbert advised the king to form a chamber of justice for the liquidation of the debts of the state. The finances were in a ruinous condition; out of eighty-four millions which the people paid the treasury received only thirty-two. The farmers of the revenue had in their hands all the resources of the kingdom; it was calculated that during the last five years they had appropriated to themselves eighty millions. They were now called to a severe account; and all the

forms of inquisitorial process, torture not excluded, were employed to convict them. The result was that Colbert recovered for the king the sources of the public revenue, and reduced the debts of the state by an arbitrary composition, which was in fact a real bankruptcy. Having got rid of the burdens, he next applied himself to simplify and improve the collection of the revenue. He reduced by two-fifths the tailles, or land and income tax, which was unequally distributed, owing to the exemptions of the privileged classes. Finding this tax unmanageable, Colbert preferred reducing it, to make it weigh less heavily on the poorer classes. He founded his chief dependence on indirect taxation, or taxes upon consumption, which he raised not less than ten-fold. Besides the octroi, or barrier duty on provisions, of which he appropriated one half to the treasury, and the aides or excise duties on wine and spirits, he imposed a stamp duty upon paper used in commercial and judicial proceedings, a stamp on plate, a duty on paper, a licence duty, and he established the monopoly of tobacco, &c. He also made a new and minute tariff for the custom duties. At his death (1683) the regular revenue of France was 116 millions of livres, of which 23 millions were absorbed by the charges of collection and administration, and the rentes or annuities due by the state, leaving 92 millions of net receipt, instead of 32, which he had found when entering office twenty-two years before. (Lemontey, 'Pièces Justificatives'.) One-half only of this increase was obtained through additional taxation; the other half was the result of better order and economy. Colbert however had to deal with a sovereign, absolute, young, fond of pleasure, of pomp, and of war, seconded by an ambitious and unprincipled minister, Louvois. In the latter years of his administration, Colbert was therefore obliged, despite of his often-expressed aversion to loans, to have recourse to ruinous loans, an increase of the oppressive tailles, the sale of offices and honours, and other extraordinary or war expedients. This took place during the second war of Louis XIV., which began in 1672, and ended by the peace of Nimègue, 1678-79.

Colbert's most strenuous and effective efforts were directed to the encouragement of commerce and manufactures. To accomplish his object, he adopted the only means known at that time, perhaps the only means practicable in his situation, and under such a government as that of Louis XIV., privileges, patents, monopolies, bounties, and honours. He is generally looked upon as the inventor, or at least the great propagator, of the system of the balance of trade. He made numerous regulations to protect, as it was then called, the various branches of national industry. He also forbade the exportation of corn with the view of insuring plenty, but the result was that cultivation declined, and France suffered several severe dearths under his administration. He is accused of having sacrificed agriculture to manufactures, but in fact his principles were erroneous with regard to both. One merchant, more enlightened than the rest, being consulted by him on the best means of favouring commerce, answered him, "Laissez faire et laissez passer," "let us alone, leave us free and uncontrolled in our transactions, and let goods pass freely,"—advice which Colbert did not understand. In the subsequent century there rose in France another school, opposite to his, which saw in agriculture alone the real wealth of a state: these men were called "economistes." Mengotti, in his sensible treatise 'Il Colbertismo,' has explained the principles and exposed the errors of both. But whatever may be thought of Colbert's measures, he certainly succeeded in giving a great impulse to French industry; he roused and directed the national mind towards a new and useful exercise of its faculties: the history of French manufactures may be said to begin with Colbert. Woollens, silk, glass, pottery, leather, and iron manufactures, were either created by him, or greatly enlarged and improved. He founded Quebec and Cayenne, made new settlements in India and on the coast of Africa, and favoured the colonies of Martinique and St. Domingo. He chartered privileged companies for the East and West Indies. He turned his attention to internal communications, restored the old roads, constructed new ones, planned and effected the great canal of Languedoc, and projected another in Burgundy. He also established a free port at Marseille, sent consuls to the Levant, and thus secured to France a considerable part of that valuable trade. He bought Dunkerque and Mardyck, on the coast of Flanders, from Charles II. of England for the sum of five millions of livres (1662). He also founded the dockyards of Brest, Toulon, and Rochefort. When he was made minister of marine, in 1669, in addition to the other departments he held, France had only a few old ships of war rotting in the harbours. Colbert purchased new ones abroad, constructed others at home, and in 1672 France had sixty ships of the line and forty frigates. But this creation of a navy was extended by the ambition of the king much beyond Colbert's original views, which were chiefly directed to the protection of the merchant trade.

Colbert brought the light of science into the various departments of the administration: his arrangement of the various offices, and the distribution of labour in each, have been highly extolled. He caused the first statistical tables of the population to be made out, and he collected the old charters and historical records of the kingdom. He removed the king's library to better premises, and increased it from 16,000 to 40,000 volumes. At the same time he formed his own extensive and valuable library, the manuscripts of which alone amounted to 14,300 volumes, which his grandson afterwards sold to the king.

He instituted a commission of legislation which framed the various ordinances of civil and criminal process, of commerce, of the woods and forests, and of marine, published in 1679 and the following years, and which with all their imperfections constituted the first code of laws for France, and from which the various legislative commissions appointed by Napoleon drew most of their materials. It was the first separation of the various branches of legislation, which had till then been confounded together in the ordinances issued upon the spur of occasions. He also had a series of laws compiled concerning the negroes and their masters in the colonies, which was called 'le Code Noir.'

A minister strict, orderly to minuteness, and averse to prodigality, could not well sympathise with Louis XIV. Colbert was ambitious, and strongly attached to his plans, which he conceived to be for the prosperity and glory of France. In order to captivate the king by means of one of his favourite tastes, that of building, which in some measure coincided with his own views, he purchased the office of superintendent of the public buildings in 1664. The gardens of the Tuilleries, the Hôtel-des-Invalides, the façade of the Louvre, the triumphal arches of St Denis and St Martin, the Boulevards, and some of the quays along the Seine, were erected under him. He also began the structure of Versailles; but the king's passion for building, thus stimulated, went far beyond Colbert's intentions, and vast treasures were sunk in a gorgeous and useless work. Colbert instituted the Academy of Sciences, and those of Inscriptions and of Architecture. He reformed the Academy of Painting, and established the school at Rome for French artists. He transferred the Académie-Française to the Louvre, and became one of its members. His temper was absolute, like that of his sovereign; he deprived Ménéral of his pension because he had written on the legality of taxation, and he laboured to lower the influence of the parliament of Paris. His manners were cold and repulsive; a poet of the time called him "a man of marble." Slow in conceiving his plans, and cautious in deciding upon their execution, he courted and listened to advice; but, when once resolved upon, his will knew no obstacles either of delicacy, feeling, or commiseration. A clear judgment, an iron will, and an indefatigable labour, supported him through his twenty-two years of administration. At last, seeing his rival Louvois enjoying the ascendancy over the king's mind; Louis preparing himself for new wars, and maintaining the war-taxes which ought to have been repealed at the peace; grieved also at the incipient persecution of the Protestants, whose commercial and manufacturing industry Colbert fully appreciated, among whom he had chosen some of his best subalterns in the administration, and of whose services he was deprived by an edict which excluded the Protestants from financial appointments, Colbert felt all the pangs of disappointment for his ill-appreciated services. Exhausted with labour he fell ill, and shortly after died, on the 6th of September, 1683, at sixty-four years of age. The people, enraged at the taxes, threatened to tear his body to pieces. He was buried in the night, attended by a military escort.

Colbert's first son was made Marquis of Seignelay, and another became Archbishop of Rheims. His brother held also high offices, and was made Marquis de Croissy. Colbert built himself a splendid mansion at Sceaux, and he left a fortune of ten millions of livres, the fruits of his rigid economy and of the liberality of Louis.

(*Notice sur Jean Baptiste Colbert in the Œuvres de Lemontey*, vol. v., *Pièces Justificatives*, Paris, 1829; see also *Mémoires de Charles Perrault*, Colbert's secretary; and *Particularités sur les Ministres de Finances*, par Montyon. The several *Vies* and *Eloges* of Colbert are not worthy of much credit.)

COLBY, THOMAS, Major-General in the army, and one of the Directors of the Ordnance Survey, was born at Rochester 1st of September 1784. When his father, Captain Colby, of the Royal Marines, sailed with the fleet under Lord Howe, he was sent to Dr. Crockett's school at Northfleet, and from thence he entered the Royal Military Academy at Woolwich. He obtained his first commission as second lieutenant of engineers in 1801, being then but seventeen years of age. His diligence and success in scientific study were such that in January of the following year, at the special request of Captain Mudge, then superintendent of the ordnance survey, he was appointed one of the assistants in that great work. Entering at once on his duties he justified the expectations formed of him, by the intelligence and conscientious activity which he brought to the work of surveying. He was on a tour of inspection in Cornwall, in 1803, when he lost his left hand by the bursting of an old pistol, and suffered at the same time such a fracture of the skull from a fragment of the barrel, that he felt the effects of the accident for the rest of his life whenever he attempted any long-continued mental exertion. Though the loss of his hand was a hindrance to the active discharge of his duties, Colonel Mudge was so well satisfied of his merits, that he kept the young lieutenant permanently attached to the survey.

In 1803 Lieutenant Colby was observing at Dunnoe, one of the prominent points of the survey; in 1804 at Beaumaris; and in 1806 with the zenith sector at Burleigh Moor and Delamere Forest. The winter months he passed in the 'Drawing Room' at the Tower, computing and preparing the results for publication, and superintending the construction and engraving of the ordnance maps on a scale of one inch to the mile. So thoroughly was he identified with

that great national work, that the history of one becomes in great measure the history of the other. In 1807 Colby was promoted to the rank of captain. The third volume of 'An Account of the Trigonometrical Survey of England' was published in 1811, and his name appearing jointly with that of Colonel Mudge on the title-page, shewed how highly his services had been appreciated by his chief. In 1813 it was determined to extend the meridian line into Scotland, a task which called out in an especial manner the energies for which Captain Colby was remarkable. Within the next three years he visited and observed at the principal stations beyond the Tweed, besides attending to his official business at the Tower. The persevering labour and activity required for a season of observation on the hills would appear incredible to one unacquainted with the nature of the work. Besides the mental exercise of keeping all the subordinates to their duty, so as to produce harmony in the results, there was much personal fatigue to be endured in long walks over the country, together with storms and wearisome delays on the mountain tops. But with Captain Colby duty was paramount, and he cared not for privation, so that the work was perfect. Major Dawson in his account of 'A Season on the Hills' gives a striking picture of the toils and hardships experienced: "It was no uncommon occurrence," he remarks, "for the camp to be enveloped in clouds for several weeks together, without affording even a glimpse of the sun or of the clear sky during the whole period. And then in a moment the clouds would break away or subside into the valleys, leaving the tips of the mountains clear and bright above an ocean of mist, and the atmosphere calm and steady, so as to admit of the observations for which the party had waited days and weeks to be taken in a few hours." At times the tents would be blown down by storms—or the camps would be whitened by a fall of hail or snow in July: or the captain taking two or three of the junior officers and a few men with him would start on a 'station-hunt;' steering a course direct by compass for the peaks that seemed most suitable, regardless of the nature of the intervening country. In these explorations they walked from thirty to forty miles a day, wading streams, crossing bogs, scaling cliffs, and sliding down into rocky valleys, Captain Colby ever the foremost; and when they came to a summit which his experience told him was suitable for a station, he would help with his own hand in building up the great pile of stones by which it was to be distinguished and observed from distant points. Sometimes the resting-place at night would be a miserable hovel where no other food was to be obtained than the national porridge; at others the weary explorers rested under a ducal roof—and on the west coast during the hot months they were tormented and blistered by the bites of innumerable midges. In one trip in 1819 the party walked 586 miles in twenty-two days. From this brief summary, a notion may be formed of the severe labour of the survey, apart from the scientific duty of observing with the instruments, which on all favourable occasions was continued from sunrise to sunset.

Captain Colby's activity and kindness of disposition were not less apparent in camp than on the station-hunts. He would assist in erecting houses to "shelter the soldiers; and occasionally join with the men in a game of quoits, or in putting the stone or crowbar, and was a warm promoter of their feast at the close of each trigonometrical season." He was quite indifferent as to personal fame, but not so as to making known the merits of his officers, and he at times permitted them to publish portions of the work in their own names rather as principals than assistants. His command over his temper was perfect; but he disliked to be disturbed by curious visitors when busy with observations for which he had long waited the opportunity. Once, while encamped on Slieve Donard in Ireland, the summit of Sea Fell in Cumberland became visible at the distance of 111 miles, and after many trials the instrument was brought to bear upon it. "Colby was on the point of successfully finishing his observation, which would have been a geodesical triumph, as including the longest side of a triangle ever attempted, when an officer on entering the observatory accidentally struck his elbow, and threw the telescope off the object. A momentary ejaculation of anger escaped his lips, but though he could not again succeed, and the object was therefore lost, he never afterwards alluded to the subject."

He was one of the party that accompanied Biot on his trip to Shetland in 1817, when, in compliance with the wishes of the French government, one of their savants was permitted to observe on the line of the English arc. A coolness however arose between Biot and Colby, and while the latter, undeterred by fog or storm, made his observations with the sector on the rock of Balta, the former carried on his pendulum observations on the island of Uist; and Colby afterwards assisted in connecting the French with the English triangulation by the observations across the straits of Dover. [Bror.]

In 1820 Captain Colby was elected a Fellow of the Royal Society; he took an active part in establishing the Astronomical Society; and General Mudge having died, he was appointed his successor as superintendent of the Survey, and in the Board of Longitude. In 1821 he was promoted to the rank of major, and in 1824 he undertook the survey of Ireland. In this work the usual mode of proceeding was modified: the survey was made dependent on actual measurements with the chain, with a trigonometrical point fixed for every 400 acres; and the whole series of operations was so ably combined that one

portion became a check on the other, and the utmost accuracy was arrived at, although the number of persons employed exceeded two thousand, mostly from the native peasantry. A change was also made in the publication: the sheets were engraved on a scale of six inches to the mile, all the principal farms, fields, and inclosures being represented, so that the maps have ever since been regarded by the government, land-proprietors, and surveyors, as authentic plans of all the estates in the country. Poor-law boundaries, townlands, land-improvements, engineering works, and the Irish census, have all been based upon them. They are comprised in 1939 sheets.

In 1825 Major Colby became lieutenant-colonel, and in that year he obtained the Duke of Wellington's sanction for raising and training three companies of sappers and miners to aid in the Irish survey, as the want of really efficient assistants was felt at first as a serious hindrance to the progress of the work. In the course of the operations Colby measured a base-line of eight miles, on the south shore of Lough Foyle, with 'compensation-bars' which he had himself invented. He had carried on a series of experiments on the heating and cooling of metal rods, and he succeeded in constructing a bar of brass and iron in combination, the extremities of which remained always the same distance apart whatever might be the temperature. Such is the exactitude obtained with this apparatus that it has since been used in measuring a base of eight miles at the Cape of Good Hope, in the re-measurement of the English bases, and in those required for the great arc of the meridian in India.

In 1838 Colonel Colby resumed the triangulation of Scotland, which had been suspended; and from this date up to his promotion to the grade of major-general in 1846, when by the regulations of the service his connection with the survey ceased, he continued his usual active and energetic superintendence of the various operations. He brought the engraving of the English maps to an excellence never before achieved. The seconds of latitude and longitude were marked on the margins, and he co-operated with Sir Henry De la Beche in introducing the geological facts and features which have since become so important a part of the survey. He took the necessary measures for a series of tidal observations round the coast of Ireland, for the purpose of establishing a true datum level: "the most important series of tide-observations," says the astronomer-royal, "that has ever been made."

Through all his scientific career General Colby never sacrificed duty to selfish considerations; and his rare administrative abilities, and sound judgment combined with high principle, enabled him to accomplish well all that he undertook. He had resources ready for every emergency, and the hardy perseverance that triumphed over all obstacles. He died at Liverpool on the 9th of October 1852, leaving a widow and seven children. He was a fellow of the chief scientific societies of London, Edinburgh, and Dublin; LL.D. of Aberdeen, and a knight of Denmark.

(*Prof. Papers Roy. Eng.; Proc. Roy. Soc.; Monthly Not. Astron. Soc.*)

COLCHESTER, CHARLES ABBOT, LORD, was born at Abingdon, on the 14th of October 1757, and was the younger son of the Rev. John Abbot, D.D., rector of All Saints, Colchester, who died about three years after the birth of his son. Mrs. Abbot, who was daughter of Jonathan Farr, Esq., of Long Whittenham, in Berkshire, married, in 1765, Mr. Jeremy Bentham, solicitor, of London, the father, by a former wife, of the distinguished writer on jurisprudence of the same names, and survived to the year 1809.

Abbot was educated at Westminster School, from which he was elected a student of Christ Church, Oxford, 1775. In 1777 he gained the chancellor's medal for Latin verse; in 1783 he took his degree of B.C.L., and became Vinerian scholar; and soon after he was called to the bar. In 1795 he published a work on 'The Jurisdiction and Practice of the Court of Great Sessions of Wales upon the Chester Circuit,' in the preface to which he urged the abolition of the separate Welsh judicature, a reform which was at last carried into effect in 1830. This same year however he retired from the bar, on succeeding his elder brother, John Farr Abbot, as clerk of the rules in the court of King's Bench. This appointment produced his next publication, entitled 'Rules and Orders of the King's Bench.'

In June 1795 Abbot was returned to parliament for the borough of Helston, in the interest of the Duke of Leeds. He sat for the same place in the next two parliaments, and he spoke on the ministerial side on several occasions during the first session with much effect. In the same session, on the 12th of April 1796, Abbot moved and obtained the appointment of a select committee to consider the subject of temporary and expiring laws; and the report of this committee, which he laid on the table of the House on that day month, led to a great improvement of the practice previously followed in regard to that kind of legislation. In the next session, on the 2nd of November 1796, he obtained the appointment of another committee to consider the most expedient mode of promulgating the statutes; and the plan that is now followed, of sending copies of all new acts as soon as printed to all the municipal bodies and benches of county magistrates throughout the kingdom, was adopted on the recommendation of this committee, and of another, also appointed on his motion, in 1801. The activity, clearness of head, and general talent for business, as well as the spirit of practical improvement, for which he had established a character, led to his being chosen chairman of the committee on the public finances, which was appointed on the motion of Mr. Pitt, on

the 10th of March 1797; and of the thirty-six reports presented by this committee in the course of that and subsequent sessions, three of the most elaborate, namely, those respecting the revenue, the exchequer, and the law courts, were prepared by Abbot. His next labours were connected with the public records, the state of which he brought before the House on the 18th of February 1800, on moving the appointment of a committee to consider what should be done for their better management, preservation, and more convenient use. The committee was appointed accordingly, and, with Abbot for its chairman, immediately set to work and prosecuted its task with so much diligence, that in the course of the same session it produced, in two successive reports, one of the most complete and masterly surveys of any subject ever laid before parliament. From the recommendation of this committee of the House of Commons originated the royal record commission, the proceedings of which continued to be superintended by Abbot till the year 1817. Meanwhile, on the 19th of May 1800, he called the attention of the House to the abuse which then prevailed of allowing the proceeds of the taxes and other moneys to lie, often for a considerable time, in the hands of the public accountants without payment of interest, and obtained leave to bring in a bill, establishing a few simple regulations, which he explained, founded substantially on the principle of assimilating the method of accounting between the crown and those of its servants entrusted with the collection or disbursement of the public money, to that generally followed in accounts between private parties, and sanctioned by all courts of justice. This scheme of reform was received with unqualified approval by both sides of the House, Mr. Tierney, the chief opposition financial authority, joining the attorney-general in expressing his commendation of it in strong terms; and the bill which Abbot obtained leave to bring in passed through all its stages in both Houses without further discussion. On the 19th of November of the same year, a few days after the commencement of the next session, he introduced to the House perhaps the most important of all the measures with which his name is connected, in a motion for leave to bring in a bill for taking a census of the population of the kingdom. The enumeration taken in the following year, which has been since decennially repeated, arose out of this proposition, being the first enumeration of the people which had ever been effected in England by public authority, at least in modern times. Abbot's motion was seconded by Mr. Wilberforce, and the bill encountered no opposition in either House.

On the retirement of Mr. Pitt, Abbot became a member of the new administration, with the offices of chief secretary for Ireland, and keeper of the Irish privy seal. Upon receiving these appointments, and being made a privy councillor, he resigned his place of clerk of the rules in the Court of King's Bench. It seems to have been about this time also that he was chosen recorder of Oxford. His official life lasted scarcely a twelvemonth. On the appointment of Mr. Mitford (afterwards Lord Redesdale), who had succeeded Addington as speaker, to the place of lord chancellor of Ireland, Abbot was, on the 10th of February 1802, elected to the vacant chair of the House of Commons. He continued to serve as speaker throughout the next three parliaments, and the greater part of the succeeding one; having been returned to that which met in November, 1802, both for Woodstock and Heytesbury, when he chose to represent the former place, and for the University of Oxford in 1806, again in 1807, and a third time in 1812. He filled the office of speaker to the satisfaction both of the House and of the public; and, although his demeanour is perhaps rather to be described as correct and graceful than as imposing or dignified, his qualifications for the place were on the whole of a very superior order, and in the performance of some of its duties he acquitted himself in a highly distinguished manner. His addresses in communicating the thanks of the House to the various naval and military officers who received that honour in the course of the war with France, afforded many happy examples of rhetorical talent. These speeches were delivered on thirteen different occasions; and they commemorate all the principal victories of the war from Roleia and Vimiera to Waterloo and the capture of Paris: that in which he communicated the thanks of the House, on the great day of the 1st of July 1814 to the Duke of Wellington, was particularly felicitous.

It ought also to be noted to the honour of Abbot, that however strong and steady were his party prejudices and attachments, he did not hesitate to make them give way, when upon any occasion they came into competition either with the rights and privileges of the House, or with what he conceived to be his duty as its speaker. A memorable example of this was the course he took on the 8th of April 1805, when the House having divided on Mr. Whitbread's motion for the impeachment of Lord Melville, and the numbers having been found equal (216 on each side), he gave his casting vote for the impeachment, on the principle that, whatever he might think of the charges, he was not entitled, in a case such as this, in which there was evidently a contest between the popular feeling and the influence of the government, to give his aid to the latter, or to make use of his official privilege to prevent a case from being sent to trial upon which the real judgment of the House had been so distinctly pronounced.

The principal subject as to which Abbot took any prominent part in the debates of the House after his elevation to the chair, was the question of the emancipation of the Roman Catholics, to which he continued to offer a steady opposition.

Abbot, as speaker, distinguished himself by the attention, correctness, and efficiency with which he performed all the routine duties of the chair, and the House and the public are indebted to him for some important improvements in the conduct of the business of parliament. In particular he gave a new and much more useful form to the printed votes of the House; and it was upon his recommendation, and upon a plan of his suggesting, that the Private Bill Office was established, in 1811.

He continued speaker till the 30th of May 1817, when a severe attack of erysipelas compelled him to resign the chair. On this the House immediately addressed the crown to bestow on him some mark of favour; and on the 3rd of June he was elevated to the peerage, as Baron Colchester. Parliament voted a pension of 4000*l.* a year to himself, and of 3000*l.* a year to his next successor in the title. The next three years he spent abroad, principally in France and Italy. After he returned home, it was only on rare occasions, as formerly in the Commons, that he took any part in the debates of the upper House of Parliament; but it has been stated that the Lords owe to him the daily publication and distribution of their proceedings, and the establishment of a library on the same plan as that of the Commons. Lord Colchester's last act of a public character was his reading to the press, in November 1828, his collected (six) 'Speeches upon the Roman Catholic Claims, delivered in the House of Commons and in the House of Peers; with Preliminary Observations,' on the state of the question of Emancipation as it then stood. He just lived to see or hear of the end of the controversy, and the defeat of his own side, by the passing of the Relief Bill brought in by Mr. Secretary Peel. He died at his house in Spring Gardens, of another attack of erysipelas, on the 8th of May 1829. Lord Colchester married on the 9th of December 1796 Elizabeth, eldest daughter of Sir Philip Gibbes, Bart., by whom he left two sons.

(Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.)

COLDEN, CADWALLADER, Lieutenant-governor of New York before the revolution, was the author of numerous works on subjects in medicine, natural philosophy, and botany. His father was minister of Dunee in Scotland, where he was born in 1688. He received his medical education at the University of Edinburgh, and in 1708 he emigrated to Pennsylvania, where for several years he practised as a physician. After visiting England, and having established a reputation by 'Remarks on Animal Secretions,' he returned to Pennsylvania, and settled finally, in 1718, in New York, where he was appointed surveyor of the lands of the colony and master in chancery, with a seat in the king's council. His principal works are—'A History of the Five Indian Nations,' 'An Account of the Diseases then prevalent in America,' 'An Essay on the Cause and Remedy of the Yellow Fever, so fatal at New York in 1743,' 'A Treatise on Gravitation,' subsequently enlarged and republished as 'Principles of Action in Matter,' with a treatise annexed, on the 'Elements of Fluxions, or Differential Calculus;' 'An Introduction to Medicine,' 'Remarks on the Inaccuracy of the History of New York.' His favourite study was botany. The 'Acta Upsaliensia' (for 1743-44, 'Plantae Novboracenses') contain his descriptions of several hundred American plants, of which 200 were new species. He left a long series of meteorological observations, with a daily register of the thermometer and barometer; and several valuable manuscripts on the vital movement, properties, of light, intelligence of animals, and on the phenomena attending the mixture of metals. Among his correspondents were most of the leading scientific and learned characters of the age, as Franklin, the Earl of Macclesfield, Gronovius, and especially Linnaeus, who honoured him by naming a new species of plants *Coldenia*. He died at his seat on Long Island at the age of eighty-nine.

* COLE, HENRY. The elaborate Introduction to the Official Catalogue of the Great Exhibition of the Industry of all Nations, in 1851, bears the signature of "Henry Cole." That introduction records the gradual steps by which the subject of such an Exhibition was familiarised to the public mind, and was at last thought worthy of royal support. In June 1845 a committee of members of the Society of Arts was formed to carry out an Exhibition of National Industry. How the instrumentality of this society, which had for many years been powerless and torpid, was brought to bear on so important an object, is not, of course, recorded in the introduction to the catalogue. The society was mainly revived by the exertions of Mr. Cole. He had always taken a deep interest in the diffusion of a knowledge of Art, in connection with industry; and had induced some manufacturers of porcelain and earthenware to make copies of works of art, as statuettes, and to produce useful articles, such as jugs and inkstands, of superior design. These were the labours of Mr. Cole's occasional leisure. His business was in the Record Office; and the vast collection of records in the Carlton Ride owes much of its usefulness to his judicious arrangements for classifying this great mass of national documents. Undeterred by the difficulties that presented themselves in the undertaking of a national exhibition, the committee of the Society of Arts established an exhibition of manufactures in 1847. In 1848 and 1849 more favour was bestowed on their exertions. Prince Albert, who had become President of the Society, took the subject under his personal superintendence; and the Exhibition of 1851 was fully determined on. It is unnecessary to trace the preliminary

labours that were to be encountered before the great idea was accomplished. It was fortunate that it was carried out without government aid; and that the most successful enterprise of our times was accomplished through the people, acting for themselves. To Mr. Cole much of this success may be justly attributed. He was one of the Executive Committee, and by his unwearied assiduity, established his position as a most valuable administrative officer. At the close of the Exhibition he received the honour of Companion of the Bath, and was subsequently appointed to an important office in that department of the Board of Trade which has the direction of the Schools of Design throughout the country. The office which Mr. Cole now holds in that department is Inspector of Schools of Design. Mr. Cole was the English commissioner in the Universal Exhibition at Paris, in 1855. In this important position he displayed his accustomed taste and industry; and by a salutary economy was enabled to accomplish all the purposes required at an expense less by 10,000*l.* than the sum voted by Parliament. As a writer, Mr. Cole is chiefly known by some agreeable Guide Books for Tourists, published under the name of 'Felix Summerly.' In 1840 he wrote a popular little work for children on 'Light, Shade, and Colour.'

COLEBROOKE, HENRY THOMAS, an eminent Oriental scholar, was the third son of Sir George Colebrooke, Bart., and was born in 1766. His mother was Mary, only daughter and heiress of Patrick Gaynor, Esq. of Antigua. He was never at any public school, but was educated at home by a private tutor. In his twelfth year he was sent to France, and he remained in that country till he was sixteen. His own inclination at this time was to enter the church; but the position of his father, who was one of the directors of the East India Company, naturally led to the selection of another career for him, and in 1782 he was appointed to a writership in India. For the first three years after he went out he resided at Calcutta, and was attached to the Board of Accounts; he was then transferred to the revenue department at Tirhoot. During his residence at this station, he acquired a fondness for field sports, which he retained while he lived. In 1789 he was removed to Purneah; and having been soon after appointed a member of a commission deputed by the government to investigate the resources of Bengal, he drew up, in conjunction with Mr. Lambert, a merchant of Calcutta, and printed for private circulation, in 1794, a very able tract, entitled 'Remarks on the Agriculture and Commerce of Bengal, by a Civil Servant of the Company,' which, besides a mass of new and valuable information, announced some propositions much beyond the current ideas of the time; among others, that of a free trade between India and England. Colebrooke's portion of this treatise was reprinted and published in London, in 1806, under the title of 'Remarks on the Husbandry and Internal Commerce of Bengal;' and an account of it may be read in the 'Edinburgh Review,' No. 19 (for April 1807), pp. 27-40. Some time before this Mr. Colebrooke had begun to study the Sanscrit; and, having now undertaken the translation of the collection or digest of Hindoo law formed under the superintendence of Sir William Jones, he had finished his task before the close of the year 1796; and the work was published, under the title of 'A Digest of Hindu Law on Contracts and Successions, from the Original Sanscrit,' in 3 vols. 8vo, at Calcutta, in 1797. Soon after the foundation of the College of Fort William he was appointed to the Professorship of the Sanscrit Language; which he appears to have held till he was removed to a judicial situation at Mirzapore. He was subsequently promoted to be Chief Judge of the courts of Sudder Dewannee Adawlut and Nizamut Adawlut; and he was for a time President of the Board of Revenue, and a member of the Supreme Council of Bengal. He was also for some years a Director of the Asiatic Society of Bengal; and many of the most valuable papers in their transactions (The Asiatic Researches) were contributed by him; particularly, 'On the Duties of a Faithful Hindu Widow,' in vol. iv.; 'Examination of Indian Classes,' in vol. v.; three 'Essays on the Religious Ceremonies of the Hindus, and of the Brahmins especially,' in vols. v. and vii.; 'On the Sanscrit and Pracrit Languages,' and others, in vol. vii.; a highly curious discourse 'On the Vedas, or Sacred Writings of the Hindus,' in vol. viii.; 'Observations on the Sect of Jains,' 'On the Indian and Arabian Divisions of the Zodiac,' 'On Ancient Monuments containing Sanscrit Inscriptions,' and others, in vol. ix.; a very elaborate disquisition 'On Sanscrit and Pracrit Poetry' (or rather prosody), in vol. x.; and 'On the Notion of the Hindu Astronomers concerning the Precession of the Equinoxes and Motions of the Planets,' in vol. xii. To the 'Transactions of the Royal Asiatic Society of Great Britain,' after his return to his native country, he contributed a 'Discourse,' read at the institution of the Society (15th March 1823), and other papers, in vol. i.; and five papers 'On the Philosophy of the Hindus,' in vols. i. and ii.; and he was also an occasional writer in the 'Asiatic Journal.' He likewise published at various times the following separate works:—'A Collection of Compositions in Sanscrit, for the use of the Students of the College of Fort William, including the Hitopadesa, with Introductory Remarks,' 4to, Calcutta, 1804; 'Grammar of the Sanscrit Language,' folio, Calcutta, 1805; 'Amara Cosha, or Dictionary of the Sanscrit Language, by Amara Sinha, with an English Interpretation and Annotations,' 4to, Calcutta, 1808; 'Two Treatises on the Hindu Law of Inheritance, translated from the Sanscrit,' 4to, Calcutta, 1810; 'Algebra, with Arithmetic and Mensuration, from the Sanscrit of

Brahmegupta and Bhascara,' 4to, Lond., 1817; a tract 'On the Import of Colonial Corn,' 8vo, Lond., 1818; and 'Miscellaneous Essays' (or reprints of previously published papers and prefaces), 2 vols. 8vo, Lond., 1837. He also, in conjunction with Professor Wilson, translated from the Sanscrit, for the Oriental Translation Fund, 'Sankhya Karika, or Memorial Verses on the Sankhya Philosophy, also the Bhashya,' &c., 4to, Oxford, 1837. Mr. Colebrooke held, along with his two brothers, the patent place of Chirographer in the Court of Common Pleas. He died on the 18th of March 1837.

COLERIDGE, SAMUEL TAYLOR, was born at Ottery St. Mary, in Devonshire, of which parish his father was the vicar, on the 21st of October 1772. He was the youngest of a numerous family, and became an orphan at the age of nine. Owing to the straitened circumstances of his family, he was sent to be educated at Christ's Hospital, where the late Charles Lamb was among his contemporaries. Here he made very great progress in classical knowledge, as may be inferred from the fact that he had, before his fifteenth year, translated the hymns of Synesius into English Anacronics. His choice of these hymns for translation is explained by his having, even at that early age, plunged deeply into metaphysics. Speaking of himself in the 'Biographia Literaria' (vol. i. p. 15), he says:—"At a very premature age, even before my fifteenth year, I had bewildered myself in metaphysics and in theological controversy. Nothing else pleased me. History and particular facts lost all interest in my mind. Poetry itself, yea, novels and romances, became insipid to me." From such pursuits he was however weaned for a time, while yet at Christ's Hospital, by the perusal of Mr. Bowles's 'Sonnets,' which had then just been published. The powerful influence which these sonnets exercised upon his mind is described at length in the first chapter of the 'Biographia Literaria.'

In 1791 Coleridge entered Jesus College, Cambridge. While at the university he did not turn his attention at all to mathematics, but obtained a prize for a Greek ode, and distinguished himself in a contest for the Craven scholarship, in which Dr. Butler, afterwards bishop of Lichfield, was the successful candidate. Coleridge did not stay to take a degree. During the second year of his residence at Cambridge, he suddenly left the university in a fit of despondency, occasioned, it is said, by unrequited love; and after wandering for a while about the streets of London in extreme pecuniary distress, terminated this adventure by enlisting in the 15th Dragoons, under the assumed name of Comberbatch. One of the officers, accidentally discovering his classical acquirements, was led to conclude that Comberbatch was something more than he professed. Questioning him in a friendly manner, and eliciting his real history, he communicated Coleridge's situation to his friends, who forthwith effected his discharge.

Coleridge now betook himself to Bristol, where he joined with three other young and clever men, like himself of ardent poetic temperaments, and imbued with strong but vague ideas of universal brotherhood—Southey and a friend, George Burnet from Oxford, and Lovell, a young quaker. They soon formed a scheme for emigrating to the banks of the Susquehanna in North America, in order there to form a social colony, the main principle of which was to be a community of goods, and where selfishness was to be proscribed. But the friends found that money would be required to establish this 'pantisocracy,' as they termed it, and Coleridge had soon not enough to furnish him with daily subsistence. He had, with the other pantisocratis, been introduced to Joseph Cottle, a benevolent bookseller at Bristol, and himself a writer of verses; and now, in his emergency, Cottle not only rendered him pecuniary assistance, but, on finding that he had written enough poems to make up a small volume, readily offered him 30 guineas for them, just five times the largest sum he had found a London bookseller willing to give. The social colony was soon dropped. Coleridge quarrelled first with Lovell, and then with Southey, and the whole scheme fell quickly into abeyance. Cottle, after paying in advance the 30 guineas, continued to furnish the young poet with other sums on the strength of promised poems, as his necessities became urgent; but it was long before the publisher received any of the poetry. The volume was published however at last (1794), and other literary schemes were projected. One, from which Coleridge anticipated great results, was a periodical entitled the 'Watchman,' which was to advocate liberal opinions; and he made a tour through the northern manufacturing towns for the purpose of canvassing for subscribers. An account of this tour, amusing on the whole, is contained in the 10th chapter of the 'Biographia Literaria.' The periodical, owing partly to a want of punctuality in its appearance, and partly to the fact that its opinions were not those which its supporters had expected, did not live beyond the 9th number.

In the autumn of 1795 Coleridge married Miss Sarah Fricker of Bristol, a sister of the wife of his friend Charles Lloyd, Southey on the same day wedding himself to another sister. Coleridge now took a cottage at Nether Stowey, a village at the foot of the Quantock Hills, in Somersetshire, where he was in the immediate neighbourhood of his friend and benefactor Mr. Poole, and of Mr. Wordsworth, who was then living at All-Foxden. He was at this time in the habit of contributing verses to one of the London papers, as a means of subsistence. In 1796 he published a volume of poems, the greater number of which had been written at earlier periods, interspersed with

some by Charles Lamb; and in 1797 a second edition appeared, with the addition of some poems by Charles Lloyd.

During the three years, moreover, in which Coleridge resided at Nether Stowey, the greater part of his principal poems was composed, though most of them were not published until later. In the conversations on poetry which constantly took place between Mr. Wordsworth and himself, was first formed the plan of the afterwards famous 'Lyrical Ballads;' and in pursuance of this the 'Ancient Mariner' and the first part of 'Christabel' were written in 1797. His tragedy, 'Remorse,' was also written at this period.

Coleridge was at this period of his life a Unitarian. He says of himself, "I was at that time and long after, though a Trinitarian (i.e., *ad normam Platonis*) in philosophy, yet a zealous Unitarian in religion; more accurately, I was a *philanthropist*, one of those who believe our Lord to have been the real son of Joseph, and who lay the main stress on the resurrection rather than the crucifixion." ('Biog. Lit.,' vol. i. p. 188.) While at Nether Stowey he preached in a Unitarian chapel at Taunton.

In 1798 Coleridge was enabled, through the munificence of the late Mr. Thomas Wedgwood, to visit Germany, for the purpose, as he expresses it, of finishing his education. At Göttingen he attended Blumenbach's lectures on physiology and natural history, and studied, in the notes of a young German student, Eichhorn's lectures on the New Testament. He took lessons from Professor Tyschen in the Gothic of Ulphilas, being anxious to attain a critical knowledge of the German language; and went through a complete historical course of German literature. His acquaintance with the writings of the later German metaphysicians was not formed until some time after his return to England.

After his return from Germany, Coleridge resided at the Lakes, where Mr. Southey and Mr. Wordsworth had then settled, the one at Keswick, and the other at Grasmere. The appellation of 'Lake-poets,' given to these three individuals after the publication of the 'Lyrical Ballads,' is well known.

Coleridge now became connected with the 'Morning Post,' and wrote both on politics and literature. From about 1808 to about 1814, he contributed to the 'Courier.' In 1804 he had visited his friend Dr. Stoddart at Malta; and from May of that year to October of the next, he acted as secretary to Sir Alexander Ball, then governor of the island. After his return to England in 1808, he delivered a course of lectures on poetry and the fine arts at the Royal Institution: lecturing on poetry and history had long before been an occasional occupation of his, partly in conjunction with Southey, at Bristol. The 'Friend' appeared in the course of the next year, being then published as a periodical at the Lakes. As a pecuniary speculation it was not much more successful than the 'Watchman,' nor with reference to pecuniary advantage was it more judiciously conducted; but it continued for a longer time. Mr. Wordsworth gave some literary assistance, contributing the 'Essay on Epitaphs,' which is now appended to the 'Excursion,' and the 'Introductory Essay' of the third volume.

Coleridge left the Lakes in 1810, and did not afterwards return to them; his wife and children remained in the house of Southey, and wholly dependent on him. On Coleridge's first arrival in London he resided with Mr. Basil Montagu; and not long afterwards became the guest of Mr. Gillman at Highgate, in whose house he died. The many friendships which Coleridge attracted to himself through life, the sincerity and constancy of which were abundantly shown, place in a striking light the amiability of his character; his neglect of his family and extreme carelessness respecting the obligations, both personal and pecuniary, which devolved upon him, as strikingly illustrate its weakness.

It was not before the commencement of his residence in London that he formed any very extensive acquaintance with the writings of the later German metaphysicians, by the adoption of whose method and terminology, rather than by any development of a system, in his subsequent publications, he has come to be accounted the representative of German metaphysics among us. He published successively, between the years 1817 and 1825, the two 'Lay Sermons,' the 'Biographia Literaria,' the *refacimento* of the 'Friend,' the 'Constitution of the Church and State according to the Idea of each,' and the 'Aids to Reflection.'

Coleridge having no profession, slothful and imprudent, was during the greater part of his life in pecuniary distress. After his connection with the newspaper-press had ceased, and his remaining hopes of self-support were derived from his later poetical and prose publications, his publisher became a bankrupt in 1819. This was a severe blow to Coleridge. The dependent situation in which it placed him preyed much upon his mind. We see him, in the collection of his letters published since his death, projecting various schemes to relieve himself. One of these was a scheme of systematic contribution to 'Blackwood's Magazine,' the publisher of which was his friend. Accordingly, No. 1 of a 'Selection from Mr. Coleridge's Literary Correspondence' appeared in the number of that magazine for October 1821, and was to have been followed by a sketch of the history and philosophy of superstition, with other interesting disquisitions; but the No. 2 never appeared. Continued ill health, combined with, and to a certain extent caused by, a habit of using opium which Coleridge had contracted, having originally resorted to it under a mistaken

notion for medicinal purposes, had taken away from him by this time even what little amount of perseverance he might once have possessed.

On the incorporation of the Royal Society of Literature by George IV. in 1825, Coleridge was selected as one of the ten Royal Associates, and as such received from that time 100 guineas a year out of the king's private purse. The annuity was withdrawn at the commencement of the reign of William IV.

In his latter years Coleridge was in the habit of holding weekly 'conversazioni' at Mr. Gillman's house in Highgate. Those who knew little else of Coleridge are familiar by report with his extraordinary conversational powers. Of these the volumes of 'Table Talk,' which have been published give no adequate notion. His conversation was not in fragments, but was wont to continue without aid from others, in the way either of suggestion or of contradiction, for hours at a time. All things human and divine, joined with one another by subtle links, entered into his discourse; which, though employed upon abstrusest subjects, was a spell whose fascination even the most dull or ignorant could not resist.

In June 1833 Coleridge was present at the meeting of the British Association of Science held that year in Cambridge. He died on the 25th of July 1834 in his sixty-second year.

Though not a man of strong character, Coleridge possessed many amiable qualities. He had all the social affections strongly developed. Though not always successful in attaining it, he had an earnest desire of truth. Thus he was by nature tolerant. But in his later years disease seems to have engendered an asperity in judging of the motives of others which was by no means consonant with the tenor of his earlier publications. To the same cause must be assigned a querulousness of disposition, which is exhibited in almost all his prose writings.

As a writer, Coleridge is to be viewed principally under two aspects: as a poet, and as the author of certain prose writings which, though miscellaneous in character, are chiefly employed upon metaphysical subjects.

As a poet, he was for a long time coupled, owing to the joint publication of the 'Lyrical Ballads' and other accidental circumstances, with Wordsworth. The silly outcry against the Lake-school has long died away, and the force of reaction has perhaps supplied a tendency as far as Coleridge is concerned, to run into the opposite extreme of admiration. But while we are ready to admit that Coleridge's poetry will not rank in the highest class, we regard it as in the very foremost rank of its own class. As specimens of finished poetic style, some of his odes and later poems are almost perfect. In his translation of Schiller's 'Wallenstein' he has displayed taste and judgment of a high order. His own tragedies, the 'Remorse' and 'Zapolya,' contain many passages excellent for the apt expression of just thoughts and tender feelings, but Coleridge never grappled closely enough with the stern realities of life to enable him to become a great dramatic writer. The 'Ancient Mariner' is a highly successful effort of fancy, in a region which had not before been tried; and the 'Christabel' contains passages which those who have once read cannot forget. In some of his smaller poems again a happy thought, or it may be a happy conceit, is as happily developed. Still he is a poet of art rather than of nature. It may be added that his earlier poems are wanting in the freshness and individuality which have always marked the earliest efforts of the greatest poets, which (to confine ourselves to modern instances) are seen in the poems of Wordsworth, Shelley, and Tennyson. His imagination seems to have been overlaid with reading and reflection. Had he been a less profound metaphysician he might have been a greater poet. Had he been aroused in early life from his morbid subjectiveness (as he would have termed it), and been driven to look with a keener interest on the world around him, to have regarded man rather than mankind, had his passions been fairly called into play and his senses stirred into activity, we might have had in Coleridge one of the most imaginative of what in the true sense of the term might be called our 'metaphysical poets,' and the grander flights as well as the subtleties of thought might have been developed in poetry of matchless melody and exquisite refinement. As it is, while we have detached passages and short poems of the purest poetry, full of the most delicate shades of refined thought, vivid gleams of fancy, and even occasional soarings into the highest regions of imagination, we have no great completed poem, and only some few short stanzas which at once delight and satisfy the mind.

In his prose writings, as in his poetry, Coleridge is perhaps, rather to be regarded as the successful stimulator of other writers than as himself a writer, whose power is acknowledged by the general public. As regards the attainment of their main professed end, Coleridge's prose writings may have had little direct value. In mental science, or psychology, he espoused a particular hypothesis (that propounded by Schelling) of the 'absolute.' But, apart from the system itself, Coleridge has done little either to advance or diffuse it. As he got it from Germany, so has he left it.

In moral science Coleridge also followed the later German metaphysicians, who make moral science a part of psychology. His political doctrines, which appear to us confined and often singularly inaccurate—are explained in the first volume of the 'Friend.' His theological views (many of them very far from the standard of orthodoxy, especially on the subject of inspiration), have only been

given to the world in posthumous publications. It was one of his most cherished schemes—his favourite vision in cloudland—to compose a work of colossal proportions which should embrace the whole range of mental philosophy taken in its widest meaning. He really only wrote a few disconnected fragments of his mighty task. But these fragments have proved of immense suggestiveness to younger intellects, and whatever be the position which Coleridge shall ultimately take among the thinkers of his country and his age, there can be now no question as to his great influence on the mind of the time.

And incomplete as they are, there is not one of Coleridge's prose writings which has not incidental merits sufficiently many and great to rescue it from oblivion with the general reader—merits discernible either in scattered criticisms on our older writers both of poetry and prose, or in illustrations drawn from stores of knowledge which a very wide reading had amassed, or in passages of great acuteness and sound practical wisdom, whenever the author lowers his flight to subjects to which such qualities can be applied with any hope as it were of immediate practical profit. And though, from the combined effects of indolence and of an intense devotion to conversational display, his ordinary style of writing is diffuse and obscure, and too much loaded with quotations, these works contain occasional passages of great beauty and power. In treating lighter subjects, his style may even be pronounced happy. Witness his account of Sir Alexander Ball in the third, and the tale of Maria Schöning in the second 'Landing-place' of the 'Friend.'

Coleridge's fame will greatly rest upon his powers as a critic in poetry and the fine arts. To establish his fame in this respect, there are his 'Lectures delivered at the Royal Institution' (published in the second volume of Coleridge's 'Literary Remains'), his review of Mr. Wordsworth's poetry, in the second volume of the 'Biographia Literaria,' which is perhaps the most philosophical piece of criticism extant in the language; and also his review of Mr. Maturin's 'Bertram,' which, though, when first published, it exposed him to much obloquy and many imputations of jealousy, is distinguished from common criticisms, if by nothing else, by a constant reference to first principles and a freedom from personality. The task of collecting and editing the unpublished works of Coleridge, so carefully and reverently performed by the poet's nephew and daughter, Henry Nelson and Sara Coleridge, has by their deaths devolved upon his son Derwent, who in 1853 published a fifth and concluding volume of the 'Literary Remains,' and has been said to be contemplating that much-needed labour, a life of the poet and a collected edition of his works.

HARTLEY COLERIDGE, the eldest son of Samuel Taylor Coleridge, was born at Clevedon, near Bristol, September 19th, 1795. Two sonnets of his father are commemorative of his birth; and an exquisite poem of Wordsworth, 'To H. C. six years old,' describes the peculiarities of the child, "whose fancies from afar are brought." His infancy is also associated with two poems of his father, 'Frost at Midnight,' and 'The Nightingale.' In 1800 S. T. Coleridge came to reside near the Lake district; and here Hartley was reared; having a brother, Derwent, four years younger than himself, and a sister, Sara, six years younger. He was taken to London in 1807; and the various sights which he saw "made an indelible impression on his mind, the effect being immediately apparent in the complexion of those extraordinary day-dreams in which he passed his visionary boyhood." In 1808 he was placed, as well as his brother Derwent, as day-scholars of the Rev. John Dawes, at Ambleside. As a school-boy his powers as a story-teller were unique; his imagination weaving an enormous romance, whose recital lasted night after night for a space of years. During their school-days, the boys had constant intercourse with Mr. Wordsworth and his family; and Hartley made the acquaintance of Professor Wilson, who was his friend through life. His friendships and connections formed the best part of his education,—"by the living voice of Coleridge, Southey, and Wordsworth, Lloyd, Wilson, and De Quincey." In 1814 Hartley left school; and in 1815 went to Oxford, as a scholar of Merton College. His extraordinary powers as a converser, and his numerous invitations to wine-parties, were injurious to him in two ways—he used great freedom of remark upon "all establishments," and he acquired habits over which he had little subsequent power of control. He passed his examination for his degree in 1818, and soon afterwards obtained a fellowship at Oriel, with high distinction. An unhappy issue followed this honourable and independent position. "At the close of his probationary year, he was judged to have forfeited his Oriel fellowship, on the ground, mainly, of intemperance." The infirmity was heavily visited. We have no record that any friend stepped in to rescue one, so otherwise blameless, so sensitive, so unfit for any worldly struggle, from the permanent consequences of this early error. His brother, who records this painful epoch of his life, with a manly and touching sincerity says, "As too often happens, the ruin of his fortunes served but to increase the weakness which had caused their overthrow." It is unnecessary for us to follow the biographer's explanation of some of the causes which led to this unhappy result—his morbid consciousness of his own singularity—his despondency at being unsuccessful in obtaining University prizes—his incapacity for the government of the pupils whom he received while at college—his impatience of control, and a belief that he was watched by those who looked with suspicion upon the most harmless

manifestations of his peculiar temperament. His qualification for future active exertion was irretrievably destroyed.

After leaving Oxford, Hartley Coleridge remained in London two years, occasionally writing in the 'London Magazine,' in which some of his sonnets first appeared. Against his will he was established at Ambleside to receive pupils. The scheme failed; and after a vain struggle of four or five years, the attempt to do what he was unfit for was abandoned. From that time to his death, in 1849, he chiefly lived in the Lake district—idle, according to ordinary notions, but a diligent reader, a deep thinker, and a writer of exquisite verses, and of prose of even a rarer order of merit. From 1820 to 1831 he contributed to 'Blackwood's Magazine.' In 1832 and 1833 he resided with Mr. Bingley, a young printer and publisher at Leeds; for whom he produced a volume of 'Poems,' and those admirable biographies of the 'Worthies of Yorkshire and Lancashire,' which make us more than ever regret that one who wrote with such ease and vivacity, should have accomplished so little. In 1834 his father died, having, in a codicil to his will, expressed great solicitude to ensure for his son that "tranquillity indispensable to any continued and successful exertion of his literary talents," by providing for him, through the proper application of a bequest after the death of his mother, "the continued means of a home." Mrs. Coleridge died in 1845, and an annuity was then purchased on Hartley's life. Meanwhile, he lived with a humble family, first at Grasmere, and then at Rydal, watched over by the kind people with whom he was an inmate, and beloved by all the inhabitants of the district. His illustrious friend Wordsworth was his close neighbour; and the house of the poet was always open to the child-like man of whose wayward career he had been almost prophetic. In 1839 Hartley wrote a life of Massinger, prefixed to an edition of his works published by Mr. Moxon; and during the latter years of his life he wrote many short poems, which appear in the two volumes published by his brother, 'With a Memoir of his Life,' in 1851. Hartley Coleridge died in the cottage which he had long occupied on the bank of Rydal Water, on the 6th of January 1849; and was buried in Grasmere churchyard. His grave is by the side of that of Wordsworth.

* THE REV. DERWENT COLERIDGE was born at Keswick, September 14, 1800, and completed his education at St. John's College, Cambridge. His earliest contributions to literature were made in 'Knight's Quarterly Magazine,' under the signature of 'Davenant Cecil.' Mr. Coleridge was ordained in 1826, but he has been chiefly occupied in connection with various important educational institutions belonging to the Established Church. He is now principal of St. Mark's College, Chelsea—the well-known training establishment for schoolmasters. Mr. Coleridge is author of a work on the 'Scriptural Character of the English Church,' and one or two other theological and educational publications; but he is best known to the general public by his admirable 'Memoir' of his brother Hartley, whose 'Poems' and 'Northern Biography' he edited. Since the death of his sister Sara, Mr. Derwent Coleridge has, as already mentioned, taken her place as editor of his father's works; and he has hitherto fulfilled his editorial duties with excellent taste and judgment. The Rev. Derwent Coleridge is a prebendary of St. Paul's Cathedral.

SARA COLERIDGE, the only daughter of Samuel Taylor Coleridge, was born at Keswick in 1803. Until her marriage she resided in the house of Robert Southey, who married her mother's sister. To his influence and paternal kindness the formation of her mental character must be largely ascribed, though she possessed in a remarkable measure the intellectual characteristics of her father. Her opening womanhood was spent at Keswick in the diligent culture and exercise of her remarkable powers. She readily lent her assistance to Southey in lightening as far as she could his literary labours: she often accompanied Wordsworth in his mountain rambles. In 1822 she had completed her first literary work, 'An Account of the Abipones, an Equestrian People of Paraguay, from the Latin of Martin Dobrizhoffer,' a translation suggested by Southey, and the admirable execution of which he has commemorated in a stanza of his 'Tale of Paraguay.' In 1829 she married her cousin, Henry Nelson Coleridge, the subject of a succeeding article. [COLERIDGE, HENRY NELSON.] She now gave herself to her domestic duties, and her next literary production was prepared as a Latin lesson-book for her children: it is called 'Pretty Lessons for Good Children,' and speedily passed through several editions. On the death of her father in 1834, her husband, who was the poet's literary executor, set himself to the task of preparing such of the poet's unpublished works as would serve best to exhibit him as a theologian, philosopher, poet, and critic, and Sara Coleridge most heartily devoted herself to assist in this pious duty. During her husband's life much of the collation and a considerable portion of the annotation fell to her share; after his death she did not hesitate to take upon herself the whole of the arduous labour. The 'Aids to Reflection,' 'Notes on Shakspeare and the Dramatists,' and 'Essays on his Own Times' were edited by her alone, and to some of them were affixed elaborate discourses on the most weighty matters in theology, morals, and philosophy, which were discussed in a clear and vigorous style, with a closeness of reasoning and an amount of erudition quite remarkable in one of her sex. But Sara Coleridge, like her father, had in no stinted measure the imaginative as well as the reasoning faculty. Her fairy tale, 'Phantasmion' wanted only the

colouring of verse to have been generally allowed to rank among the more beautiful poems of the age; but in prose its often exquisite imagery and delicate shades of thought and feeling seemed to lack some clear and palpable intention; and it was regarded for the most part as vague, visionary, and obscure. Probably it will be on her commentaries upon her father's works—from which they are not likely to be by any future editor dissociated—that her fame will ultimately rest; but her rare acquirements and rarer gifts being thus expended on annotations, are now scarcely likely ever to meet with their due recognition. Sara Coleridge survived her husband ten years: she died May 3rd, 1852. At her death she was engaged in preparing a new edition of her father's poems, which was completed and published by her brother: 'Poems of S. T. Coleridge, edited by Derwent and Sara Coleridge,' 1852.

COLERIDGE, HENRY NELSON, the son of Colonel Coleridge, a brother of the poet [COLERIDGE, SAMUEL TAYLOR], was born at the beginning of this century. He was educated on the foundation at Eton, and in due course was elected scholar, and subsequently fellow, of King's College, Cambridge. He took his degree of B.A. in 1823. The scholars of King's having the somewhat questionable privilege of obtaining their degrees without examination, Mr. Coleridge's name is not found amongst the candidates for classical or mathematical honours; but he was well known in the university as one of great talents and rich acquirements, and he gave public evidence of his taste and scholarship, in 1820 and 1821, in the first of which years he obtained two out of the three of Sir W. Browne's medals, namely, that for the Greek ode and that for the Latin ode, and in the second year was again the successful candidate for the Greek ode. In 1823 he was a contributor, in conjunction with W. S. Walker, W. M. Praed, T. B. Macaulay, J. Moultrie, and others of his university, to 'Knight's Quarterly Magazine.' His papers, which bear the signature of 'Joseph Haller,' on 'The English Constitution,' 'The Long Parliament,' 'Mirabeau,' &c., are distinguished for a soundness of opinion, and a liberal and comprehensive view of historical questions, which are evidence of the extent of his acquirements beyond the ordinary range of university reading. Having fallen into ill health, Mr. Coleridge, in 1825, accompanied his uncle, the Bishop of Barbadoes, on his outward voyage. Upon his return to England in the same year, he published a most lively and amusing narrative of his tropical experiences, under the title of 'Six Months in the West Indies,' which had the unusual good fortune of quickly passing into a fourth edition.

His restored health opened to Mr. Coleridge a course of honourable action. He was called to the bar by the Society of the Middle Temple, on the 24th of November 1826, and, during the ensuing fourteen years, gradually advanced to a good practice in the Court of Chancery. During this period he assiduously cultivated his literary tastes, and more especially dedicated all his leisure to the society of his illustrious uncle, whose conversation was a perpetual store of the most varied knowledge. The accomplished daughter of the poet became the wife of Henry Coleridge soon after he was called to the bar. In 1830 Mr. Henry Coleridge published an 'Introduction to the Study of the Greek Classic Poets.' Until the death of S. T. Coleridge, in 1834, his nephew most assiduously devoted himself to the grateful task of noting down with all reverence the fragments of this extraordinary man's eloquent talk, or more properly declamation. In 1835 some of the results of this labour of love were given to the world in 'Specimens of the Table Talk of the late Samuel Taylor Coleridge,' in two small volumes. It has been objected that these fragments, in which Coleridge's opinions are arranged under particular subjects, give no just notion of the character of his talk. His nephew anticipates the objection: "I know better than any one can tell me, how inadequately these specimens represent the peculiar splendour and individuality of Mr. Coleridge's conversation. How should it be otherwise? Who could always follow to the turning-point his long arrow-flights of thought!" Yet the book must always possess a deep interest. Of its literal truth as a record of Coleridge's opinions, however it may fall short of giving an adequate notion of his mode of expressing them, no one can doubt. The 'Table Talk' was followed in 1836 by two octavo volumes of 'The Literary Remains of S. T. Coleridge,' also edited by his nephew; and a third volume of the same series was published in 1838. The care and judgment with which this difficult undertaking is executed, have given to these fragmentary materials—"Sibylline leaves,—notes of the lecturer, memoranda of the investigator, outpourings of the solitary and self-communing student,—a permanent value. In 1837 Mr. Henry Coleridge republished 'The Friend'—his uncle's little-known periodical work—one of the most remarkable books in modern literature. In 1840 he also edited 'Confessions of an Inquiring Spirit,'—a series of letters on the inspiration of the Scriptures, left by Mr. Coleridge in manuscript at his death. In this mass of materials, which we owe in great part to the unwearied industry of Mr. Henry Coleridge, amidst the short leisure of a laborious profession, will be found the best evidence of Coleridge's claims to a lasting reputation as a critic and a philosopher.

We have little to add to this imperfect notice. In 1842 Mr. H. Coleridge had a return of the painful maladies which had received a temporary relief in 1825. For many months he was prostrate on a bed of sickness, enduring pain with a most exemplary fortitude and

cheerfulness, and supported by that strong religious feeling which formed a principal feature of his character. He died on the 26th of January 1843, and was buried by the side of his uncle, in Highgate old church-yard. His wife survived him till 1852. She is noticed further, with the poet's other children, under COLERIDGE, SAMUEL TAYLOR.

COLET, JOHN, the founder of St. Paul's School, was born in the parish of St. Antholin, London, in 1466, and was the eldest son of Sir Henry Colet, knight, twice lord mayor, who had besides him twenty-one children. In 1483 he was sent to Magdalen College, Oxford, where he passed seven years, and took the usual degrees in arts. Here he studied Latin, with some of the Greek authors through a Latin medium, and mathematics. Having thus laid a good foundation of learning at home, he travelled abroad for further improvement; first to France, and then to Italy, in which two countries he continued from 1493 to 1497. Before his departure however, and indeed when only of two years' standing in the university, being then in acolythe's orders, he was instituted to the rectory of Dennington in Suffolk, which he held till his death. His father also presented him in 1485 to the rectory of Thyrning in Huntingdonshire, which he resigned in 1498. At Paris he became acquainted with Budæus, and was afterwards introduced to Erasmus. In Italy he contracted a friendship with numerous eminent persons, and especially with some of his own countrymen, among whom were Grocyon, Linacre, Lilly, and Latimer, all of whom were studying the Greek language, then but little known in England. Whilst abroad he devoted himself chiefly to divinity and the study of the civil and canon law. During his absence from England he was made a prebendary of York in 1497, and was also made a canon and prebendary of St. Martin's-le-Grand in London. He returned in this year, and was ordained deacon; taking priest's orders in the following year. Soon after this he retired to Oxford, where Erasmus came, and renewed his friendship with him. In Oxford he read public lectures upon St. Paul's Epistles gratuitously. In 1502, having proceeded in divinity, he became prebendary of Durnford in the church of Salisbury, and in 1504 resigned his prebendary at St. Martin's-le-Grand. In the same year he commenced D.D. In May 1505 he was instituted to the prebendary of Mora in St. Paul's, London, and in the same year and month was appointed dean. In this office he reformed the decayed discipline of his cathedral, and introduced a new practice of preaching himself upon Sundays and great festivals.

By his own and by other lectures which he caused to be read in his cathedral, Colet mainly assisted in raising that spirit of inquiry after the holy Scriptures which eventually produced the reformation; but the contempt which he avowed for the abuses in religious houses, his aversion to the celibacy of the clergy, and the general freedom of his opinions, made him obnoxious to some of the clergy, and especially to Fitzjames, then bishop of London, who accused him to Archbishop Warham as a dangerous man, and even preferred articles against him. Warham however dismissed the case. From Bishop Latimer's sermons it should seem that Fitzjames afterwards tried to stir up the king and court against him.

At length, tired with trouble and persecution, Colet began to think of retiring from the world. He had now an ample estate, without any near relations, for numerous as his brethren had been, he had outlived them all. He resolved therefore, in the midst of life and health, to consecrate his fortune to some lasting benefaction, which he performed in the foundation of St. Paul's School, of which he appointed William Lilly first master in 1512. He ordained that there should be in this school a high-master, a sur-master, and a chaplain, who should teach gratis 158 children, divided into eight classes; and he endowed it with lands and houses then producing an income of 122*l.* 4*s.* 7*d.* per annum, of which endowment he made the Company of Mercers trustees. The gross average income of St. Paul's School was, more than twenty years ago, about 5300*l.* per annum, and is now much larger. (Carlisle's 'Grammar Schools,' vol. ii. p. 94.) To further his scheme of retiring, Colet built for himself a handsome house near the royal palace of Richmond in Surrey, in which he intended to reside; but having been seized by the sweating-sickness twice, and relapsing into it a third time, a consumption ensued, which proved fatal, September 16, 1519, in his fifty-third year. He was buried in St. Paul's choir, with an humble monument which he had himself prepared some years before, bearing simply his name. Another monument was afterwards set up for him by the Mercers' Company, of a handsomer description, but it was destroyed in the fire of 1666. It had previously been engraved for Dugdale's 'History of St. Paul's.'

Dean Colet's works were—1. *Oratio ad Clerum in Convocatione*, anno 1511; reprinted by Dr. Samuel Knight, in the appendix to his 'Life of Colet,' with an old English translation of it, supposed to have been done by the author himself. 2. 'The Construction of the Eight Parts of Speech, entitled Absolutissimus de octo Orationis partium constructione Libellus,' 8vo, Antw., 1530. 3. 'Rudimenta Grammaticæ,' for the use of his school, commonly called 'Paul's Accidence,' 8vo, 1539. 4. 'Daily Devotions,' said not to be all of his composition. 5. 'Mouition to a Godly Life,' 8vo, 1584, &c. Many of his letters are printed in Erasmus's 'Epistles,' and five, with one from Erasmus, in the appendix to Knight's 'Life.' The original statutes of St. Paul's School, signed by Dean Colet, were some years ago accidentally picked

up at a bookseller's by the late Mr. Hamper of Birmingham, and by him presented to the British Museum.

(Knight, *Life of Dr. John Colet*, 8vo, London, 1724; Wood, *Athenæ Oxon.*, &c.)

COLIGNY, GASPARD DE, born in February 1516, was the son of Gaspard de Coligny, lord of Châtillon-sur-Loing and marshal of France, and of Louise de Montmorency, sister to the famous duke and constable of that name. Coligny served in Italy under Francis I., and was present at the battle of Cerisoles. Henri II. made him colonel-general of infantry, and afterwards in 1552 admiral of France. In the latter capacity he sent a colony to Brazil, which however was soon after driven away by the Portuguese. Coligny himself continued to serve in the army by land. He defended St. Quentin against Philip II., and was made prisoner at the surrender of the place.

Having embraced the reformed religion, Coligny became, with Louis prince of Condé, one of the great leaders of the Protestant party against Catherine de' Medici and the Guises, during the reign of Charles IX. Coligny was much respected by his party: he was prudent in his plans and cool in danger; defeat did not dishearten him, and he rose again after it as formidable as ever. After the loss of the battle of Dreux, in which Condé was taken prisoner, Coligny saved the remains of his army. The following year peace was made, but in 1567 the civil and religious war broke out again, and the battle of St. Denis was fought, in which the old Constable Montmorency, who commanded the royal or Catholic army, was killed. A short truce followed, but hostilities broke out again in 1569, when the battle of Jarnac was fought, in which the Prince of Condé was killed. Coligny again took the command and saved his army, which was soon after joined by the Prince of Béarn (afterwards Henri IV.), then sixteen years of age, and Henry, the son of Condé, who was but seventeen. The Prince of Béarn was declared the head of the Protestants, but Coligny exercised all the functions of leader and commander. On the 3rd of October 1569 Coligny lost the battle of Moncontour, against the Duke of Anjou (afterwards Henri III.). Still Coligny continued the war south of the Loire, gained several advantages, and at last a peace was concluded at St. Germain in August 1570, which was called 'la paix boiteuse et mal assise,' because it was concluded by the Sieur de Biron, who was lame, and by De Mesmes, lord of Malaisie. The peace however fully deserved its nickname by the spirit in which it was concluded by the court. The leaders of the Protestants, and Coligny among the rest, entertained strong suspicions on the subject; but they were lulled into security by the apparent frankness of Charles IX., and the approaching marriage of the Prince of Béarn with the Princess Margaret, the king's sister. Coligny came to court, and was well received, but on the 22nd of August 1572 he was shot at in the street by an attendant of the Duke of Guise. The wounds however did not prove dangerous. The attempt was made at the instigation of the Duchess of Nemours, whose first husband, Francis, duke of Guise, had been assassinated by a Huguenot fanatic at the siege of Orléans in 1563, when Coligny was unjustly suspected of having directed the blow. The Duke of Anjou and the queen-mother were parties to the attempt upon Coligny's life. On the 24th of August 1572, two days later, the massacre of 'la Sainte Barthélemy' took place. [CHARLES IX.] The Duke of Guise himself led the murderers to the house of the admiral, but remained in the court below, while Beame, one of his servants, went up followed by others. They found Coligny seated in an arm-chair. "Young man," said he to Beame, "you ought to respect my gray hairs; but, do what you will, you can but shorten my life by a few days." They stabbed him in several places, and threw him, still breathing, out of a window into the court, where he fell at the feet of the Duke of Guise. His body was left exposed to the fury of the populace, and at last was hung by the feet to a gibbet. His head was cut off and sent to Catherine de' Medici. Montmorency, cousin to the admiral, had his body secretly buried in the vaults of the château of Chantilly, where it remained in a leaden coffin till 1786, when Montesquieu asked for the remains of Coligny from the Duke of Luxembourg, lord of Châtillon, and transferred them to his own estate of Maupertuis, where he raised a sepulchral chapel and a monument to the memory of the admiral. After the revolution the monument was transferred to the Musée des Monuments Français, and a Latin inscription was placed upon it by M. Marron, the head of the Protestant consistory at Paris.

COLIN, ALEXANDER, the sculptor of the excellent marble alt-relievi of the celebrated tomb of the Emperor Maximilian I. in the Kreuzkirche at Innsbruck. Colin was born at Mechlin in 1526, and in 1563 was invited by the Emperor Ferdinand I. to Innsbruck, to complete the alt-relievi of his grandfather's tomb, which had been commenced by the brothers Abel. They were completed by Colin, with the help of assistants, in three years, for on one side of the monument is "Alexand. Colinus Mechliniensis, sculptor, anno 1566." The sculptures consist of twenty-four marble tablets, fixed into the four sides of the tomb, and record all the principal acts and victories of the Emperor Maximilian. The figures are small, but they are executed with great skill and extreme care. The tomb is surrounded by twenty-eight colossal bronze statues of heroes of the middle ages; it is altogether one of the most magnificent monuments in Europe, and has often been mentioned in the very highest terms by old and modern travellers. The bronze statues were executed by a founder of

the name of Hans Lendenstreich, and Godel and Löffler, two other Tyrolean sculptors and founders. Colin executed also the two monuments of his patron the Archduke Ferdinand of the Tyrol and his first wife Philippa, in a chapel in the Hofkirche at Innsbruck: the latter bears the date of 1581. They are both extremely costly and elaborate works. There are other works by Colin in Innsbruck and its vicinity; some in wood, and of very minute and excellent workmanship. He was court sculptor to the Emperor Ferdinand I. and to his son the Archduke Ferdinand of the Tyrol, and died at Innsbruck in 1612.

(Von Lemmen, *Tirolisches Künstlerlexikon*.)

COLLE, RAFFAELLINO DAL, a celebrated Italian painter, born at Colle, near Città San Sepolcro, but in what year is not known. He is generally considered as one of the scholars and assistants of Raffaello in the Farnesina and in the Vatican; but he was certainly, according to Vasari, the assistant of Giulio Romano in Rome, and probably at Mantua, and also of Vasari himself at Florence in 1536, upon the occasion of the visit of Charles V., when Vasari had the direction of the decorations ordered by the authorities in honour of the emperor's visit. As Vasari did not write the life of Raffaellino, little is known about him. He appears to have been chiefly employed in the neighbourhood of Città San Sepolcro, at Urbino, Perugia, Pesaro, Gubbio, Cagli, and Città di Castello, in which places he executed several fine altarpieces, which still exist, and exhibit him as one of the best disciples of the Roman school. Notwithstanding his own reputation, he did not disdain to enter into the service of Vasari in 1536, when he made, from the designs of Bronzino, cartoons for the tapestries of Cosmo I. Another more striking instance of humility, or good-fellowship, is recorded of him, which happened at San Sepolcro: Il Rosso arrived in the city at a time when Raffaellino was about to execute a work which he had undertaken to paint, and he surrendered his commission to Il Rosso as a mark of esteem for his ability. The date of his death is not known. (Lanzi, *Storia Pittorica*, &c.)

COLLIER, JEREMY, was born on the 23rd of September 1650, at Stow Qui, in Cambridgeshire. He was educated under his father, who was master of the free school of Ipswich. In 1669 he was admitted of Caius College, Cambridge, and in 1676 took the degree of M.A. He resided some time as chaplain with the countess dowager of Dorset, and then received the small rectory of Ampton, in Suffolk. In 1685 he resigned this living and came to London, when he was soon appointed lecturer of Gray's Inn. At the revolution of 1688 he put himself in opposition to the government and the church as established under William III., and engaged in a hot controversy with Burnet, afterwards Bishop of Salisbury. One of his publications, 'The Desertion Discussed, in a Letter to a Country Gentleman,' (4to, 1688) gave great offence to the new government, and Collier was sent a close prisoner to Newgate, where he remained some months, and whence he was, at last, discharged without ever being brought to trial. This persecution did not cool his zeal: during the four following years he published a number of works, which were all of a political and controversial nature. Towards the end of 1692 Collier, with Newton, another non-juring clergyman, was arrested at a solitary place on the Kentish coast, whither he was supposed to have gone for the purpose of communicating with the partisans of the house of Stuart on the other side of the water. After a short examination before the Earl of Nottingham, secretary of state, he was committed to the Gate-house. There was no evidence against him; but in consequence of his questioning the legality of the courts, and refusing bail, he suffered a short imprisonment in the King's Bench.

In the course of 1692 and 1693 he published six more works, all hostile to government. In 1696 he was prosecuted for giving church absolution to Sir John Friend and Sir William Perkins, who were convicted of being accessories in the plot to assassinate King William. Collier absconded and was outlawed. The outlawry was never revoked, but the energetic divine, after the first rigour was abated, seems to have cared little for it. He lived in London or its suburbs till his death, supporting himself by his literary labours. In the course of the very year in which he was outlawed he put forth five political works. The next year he published the first volume of his 'Essays upon several Moral Subjects,' adding a second volume in 1705, and a third in 1709. These essays were much admired at the time. It was however in 1698 that he produced the work by which he is now best known: 'A Short View of the Immorality and Profaneness of the English Stage, together with the Sense of Antiquity upon this Argument,' 1 vol. 8vo. The 'Short View' was almost as severe upon theatres and theatrical writers as Prynne's famous 'Histrio-Mastix,' published about 65 years before. It led to a controversy with Congreve and Vaubrun, in which many sheets were printed on both sides, many hard names exchanged, and in which Collier, to whom contest was a delight, is thought to have had the better of his adversaries. After three other defences of his 'View,' he published, in 1708, 'Mr. Collier's Disuasive from the Play-house, in a Letter to a Person of Quality, occasioned by the late calamity of the Tempest.' This literary combat lasted ten whole years; but Collier lived to see the English stage become much more decent than it had been—an improvement to which he had doubtlessly contributed.

Between the years 1701 and 1721 he translated and published Moreri's great 'Historical Dictionary,' and wrote and published 'The

Ecclesiastical History of Great Britain,' in two huge folio volumes. The history was attacked by Bishop Burnet and others, to whom Collier replied with his usual vigour. He was the author of a few other religious and controversial papers. He died on the 26th of April 1726, in the 76th year of his age, and was buried in the churchyard of St. Pancras, London.

* COLLIER, J. PAYNE, was born in London in 1789. The chief labours of Mr. Collier's literary life will be associated with Shakespeare and our early dramatic literature. In 1820, when he was "of the Middle Temple," he published 'The Poetical Decameron; or Ten Conversations on English Poets and Poetry, particularly of the Reigns of Elizabeth and James I.' In these two volumes he displays much bibliographical research, which, probably, would have found more acceptance and been really more amusing if produced in a less artificial form than that of dialogue. In 1825 he issued an allegorical poem entitled 'The Poet's Pilgrimage.' A new edition of Dodsley's Old Plays was undertaken by him, six additional plays being added, and a supplementary volume contained five others; these were issued in 13 vols. 8vo, in 1825-27. In 1831 appeared 'The History of English Dramatic Poetry in the Time of Shakespeare, and Annals of the Stage to the Restoration.' This work, in three volumes, contains a mass of information, chiefly collected from original sources, and is indispensable to the student of our dramatic literature. Three small volumes, of which a very limited number of each was printed, appeared in 1835, 1836, and 1839, entitled 'New Facts regarding the Life of Shakespeare;' 'New Facts regarding the Works of Shakespeare;' and 'Further Particulars regarding Shakespeare and his Works.' In these little books some curious matters, previously unpublished, first appeared; and all subsequent biographers of the poet have acknowledged their value. In 1844 Mr. Collier completed, in eight volumes, his edition of the Works of Shakespeare, "founded upon an entirely new collation of the old editions." Without embodying any elaborate criticism, or dealing much in conjectural emendations, this edition will always be valuable for its careful exhibition of the various old readings. Mr. Collier was one of the most active and zealous members of the 'Shakespeare Society.' Among the works of that society there are none more useful and curious than those which he wrote or edited. Amongst these are 'Memoirs of Edward Alleyn,' 1841; 'The Diary of Philip Henslowe,' 1845; 'Memoirs of the Principal Actors in Shakespeare's Plays,' 1846; 'Extracts from the Registers of the Stationers' Company,' from 1557 to 1580, in 2 vols. published in 1848-49. Mr. Collier also published 'Shakespeare's Library,' being a collection of the romances, &c., used as the foundation of his dramas. In 1852 appeared 'Notes and Emendations to the Text of Shakespeare's Plays, from early Manuscript Corrections in a Copy of the folio of 1632, in the possession of J. Payne Collier;' and in 1853 Mr. Collier produced a new edition of the plays of Shakespeare, "the text regulated by the old copies, and by the recently discovered folio of 1632." This edition, in one large volume, contains no note to explain what part of the text is from "the recently discovered folio of 1632." The discovery of this folio produced a considerable sensation, not only in this country, but in America and Germany; and much controversy has arisen on the merits of the corrections. This is not the place to offer an opinion of the value in general of these emendations, nor even as to the date at which the "early manuscript corrections" were written on the margin of the folio of 1632. Mr. Collier himself is "doubtful regarding some, and opposed to others;" but nevertheless "it is his deliberate opinion that the great majority of them assert a well-founded claim to a place in every future reprint of Shakespeare's dramatic works." One thing however we may venture to say—that these emendations rest upon no more absolute authority than those of Theobald or any other early or late commentator. A vast number of them are corrections of typographical errors, long since corrected, as a matter of course, in all reprints. Those which are conjectural emendations must be subjected to the usual test of individual appreciation of the meaning of the author, and of the forms of expression which sometimes constitute a portion of his excellence, even while they involve difficulties not to be got over by a more familiar rendering. But whatever may be the opinion of the value of these Manuscript Corrections, all must agree that Mr. Collier has acted with the most scrupulous good faith in their publication.

Mr. Collier married in 1816; he is a Vice-President of the Society of Antiquaries, and he was Secretary to the Royal Commission appointed to inquire into the management of the British Museum, when he proposed a plan for a catalogue of the library, which was not adopted. Mr. Collier is in receipt of a pension from the crown of 100*l.* a-year, granted to him by Sir Robert Peel, in acknowledgment of his services to the literature of his country.

COLLINGWOOD, CUTHBERT, ADMIRAL LORD, was born on the 26th of September 1750, at Newcastle-upon-Tyne. At the age of eleven he was sent to sea as a midshipman, under the care of Captain (afterwards Admiral) Brathwaite, who was the son of his mother's sister, and who seems to have taken extraordinary pains in giving him nautical knowledge. After serving some years with this relation, he sailed with Admiral Roddam. In 1774, during the American war, he went to Boston with Admiral Graves, and in 1775 was made a lieutenant by him, on the day of the battle of Bunker's Hill, when Collingwood, with a party of seamen, supplied the British army with

what it required. In 1776 he took the command of the 'Hornet' sloop, and soon after met, at Jamaica, with his favourite companion Horatio Nelson, who was then lieutenant of the 'Lowestoffe.' Collingwood says, in one of his interesting letters, "We had been long before in habits of great friendship; and it happened here, that as Admiral Sir P. Parker, the commander-in-chief, was the friend of both, whenever Nelson got a step in rank I succeeded him: first in the 'Lowestoffe,' then in the 'Bedger,' into which ship I was made commander in 1779, and afterwards in the 'Hinchinbroke,' a 28-gun frigate, which made us both post-captains."

Although Nelson, who was a younger man, always kept a remove ahead of him, and came in for a much larger share of fame or popularity, Collingwood never had a feeling of jealousy towards his friend, whose merits he was always the first to extol, and whom he loved to the last hour of his life. Nelson, on his part, seems to have had a greater affection for Collingwood than for any other officer in the service.

In 1780 Nelson was sent, in the 'Hinchinbroke' to the Spanish Main, with orders to pass into the South Sea by a navigation of boats along the river San Juan and the lakes Nicaragua and Leon—a physical impossibility, which no skill or perseverance could surmount. Nelson caught the disease of the climate, and his life was with difficulty saved by sending him home to England. Collingwood, who succeeded him at the San Juan River, had many attacks; his hardy constitution resisted them all, and he survived the mass of his ship's company, having buried in four months 180 of the 200 men who composed it. Other ships suffered in the same proportion. In August 1781, Collingwood was wrecked in the middle of a dreadful night in the 'Pelican,' a small frigate which he then commanded, on the rocks of the Morant-Keys in the West Indies, and saved his own and his crew's lives with great difficulty. His next appointment was to the 'Sampson,' 64. In 1783 he went to the West Indies in the 'Mediator,' and remained with his friend Nelson on that station till the end of 1786. He then returned, after twenty-five years' uninterrupted service, to Northumberland, "making," as he says, "my acquaintance with my own family, to whom I had hitherto been, as it were, a stranger." In 1790 he again went to the West Indies, but a quarrel with Spain being amicably arranged he soon returned, and seeing, as he says, no further hope of employment at sea, he "went into the north and was married." In 1793 the war with the French republic called him away from his wife and two infant daughters, whom he most tenderly loved, though he was never after permitted to have much of their society. As captain of the 'Barfleur,' he bore a conspicuous part in Lord Howe's victory of the 1st of June 1794. In 1797 he commanded, with his usual bravery and almost unrivalled nautical skill, the 'Excellent,' 74, in Jarvis's victory of the 14th of February, off Cape St. Vincent. In 1799 he was raised to the rank of rear-admiral. The peace of Amiens, for which he had long prayed, restored him to his wife and children for a few months in 1802; but the renewed war called him to sea in the spring of 1803, and he never more returned to his happy home. This constant service made him frequently lament that he was hardly known to his own children, and the anxieties and wear and tear of it shortened his valuable life. Passing over many less brilliant but still very important services, Collingwood was second in command in the battle of Trafalgar, fought on the 21st of October 1805. His ship, the 'Royal Sovereign,' was the first to attack and break the enemy's line; and, upon Nelson's death, Collingwood finished the victory and continued in command of the fleet. He was now raised to the peerage. After a long and most wearying blockade of Cadix, the Straits of Gibraltar, and adjacent coasts, during which, for nearly three years, he hardly ever set foot on shore, and showed a degree of patience and conduct never surpassed, he sailed up the Mediterranean, where his position involved him in difficult political transactions, which he generally managed with ability. The letters to foreign princes and ministers, the despatches of this sailor who had been at sea from his childhood, are admirable even in point of style. Completely worn out in body, but with a spirit intent on his duties to the last, Collingwood died at sea on board the 'Ville de Paris,' near Port Mahon, on the evening of the 7th of March 1810. In command he was firm but mild—most considerate of the comfort and health of his men—averse to flogging and all violent and brutal exercises of authority; the sailors called him their father. As a scientific seaman and naval tactician he had few if any equals, and in action his judgment was as cool as his courage was ardent. His mind was enlightened to an astonishing degree, considering the circumstances of his life; he was liberal and kind-hearted, and all his private virtues were of the most amiable sort. His letters to his wife on the education of his daughters are full of good sense and feeling.

(A Selection from the Public and Private Correspondence of Vice-Admiral Lord Collingwood; interspersed with Memoirs of his Life. By G. L. Newnham Collingwood, Esq., F.R.S., 2 vols. 8vo, second edit., Lond., 1828.)

COLLINS, ANTHONY, was born in 1676 at Heston, near Hounslow, in Middlesex. His father, Henry Collins, Esq., was an independent gentleman, with an income of 1800*l.* a year. After the usual preparatory studies at Eton, he went to King's College, Cambridge, and had for his tutor Francis Hare, afterwards bishop of Chichester. He then became a student of the Temple, and married a daughter of Sir

Francis Child, Lord Mayor of London. During 1703 and 1704 he carried on a correspondence with Locke, who appears to have cherished a most enthusiastic friendship for him, and regarded him as having "as much of the love of truth for truth's sake as ever he met with in anybody." The letters of Locke to Collins are indeed filled with the strongest expressions of esteem and admiration. Twenty-five letters of Locke to Collins are preserved in the 'Collection of Pieces by Locke,' not contained in his works, published by Des Maizeaux, 8vo, 1720.

In 1707 Collins published an essay concerning human reason as supporting human testimony. It was replied to by Bishop Gastrell. The same year he entered into a controversy with Dr. Samuel Clarke, in support of Dr. Dodwell's book against the natural immortality of the human soul. Five successive rejoinders were elicited. In 1709 he published 'Priestcraft in perfection, or a detection of the fraud of inserting and continuing this clause (the church hath power to decree rites and ceremonies, and authority in controversies of faith) in the 20th article.' It passed through three editions in the same year, and occasioned a very general and anxious inquiry. Numerous pamphlets, sermons, and books discussed the question. Two works especially were written against it with great labour, and were supplied with hints and materials from all quarters of the church: one, entitled 'A Vindication of the Church of England from Fraud and Forgery, by a Priest,' 8vo, 1710; the other, a long-delayed and elaborate essay on the Thirty-nine Articles, by Dr. Bennet, 8vo. To these Collins replied in his historical and critical essay on the Thirty-nine Articles, in 1724, proving (p. 277-78) that the clause has neither the authority of the convocation nor of the parliament. Collins's next work was entitled 'A Vindication of the Divine Attributes,' being remarks on a sermon of the archbishop of Dublin, which asserted the consistency of divine foreknowledge and predestination with human free-will. He went in 1711 to Holland, where he formed a friendly intercourse with Le Clerc, and other leading characters among the learned of that country. On returning to England he published, in 1713, his 'Discourse on Freethinking,' which excited much animadversion among the clergy. The most important of the replies which appeared was that by Dr. Bentley, entitled 'Remarks on the Discourse of Freethinking by Phileleutherus Lipsiensis,' which is remarkable as a display of learned sagacity, coarse wit, and intemperate abuse. The object of Collins is to show that, in all ages, the most intellectual and virtuous men have been freethinkers; that is, followers of philosophical reasoning, in disregard of established opinions. There are several French editions of this work. It was reprinted at the Hague, with some additions and corrections derived from Bentley's 'Remarks.' On the continent it was answered by Crousas, and several others. The 'Clergyman's Thanks to Phileleutherus,' 1713, is by Bishop Hare. Collins, on returning from a second residence in Holland, was made justice of the peace and deputy-lieutenant of the county of Essex, offices which he had previously held in Middlesex. In 1715 he published his 'Philosophical Inquiry concerning Liberty and Necessity,' which was reprinted in 1717 in 8vo, with corrections. It was translated into French, and is printed in the 'Recueil de Pièces sur la Philosophie,' &c., by Des Maizeaux, 2 vols. 12mo, 1720. Dr. Samuel Clarke replied to the necessarian doctrine of Collins, chiefly by insisting on its inexpediency, considered as destructive of moral responsibility.

In 1718 Collins was appointed treasurer of the county of Essex, an office which he performed with great fidelity. He married, in 1724, his second wife, the daughter of Sir Walter Wrottesley, Bart. In the same year he published his 'Grounds and Reasons of the Christian Religion,' in which his object is to show that Christianity is founded and dependent on Judaism; that the New Testament is based upon the Old, as the canon of Christians; that the apostles and writers of the former establish and prove their propositions from the latter; and that none of the passages they adduce are literally, but merely typically and allegorically, applicable, by the assumption of a double construction. This work created a great sensation in the church, and drew forth a great number of replies from some of the most eminent divines. In the final answer of Collins, 'Scheme of Literal Prophecy,' 1726, he enumerates five-and-thirty replies which appeared during the first two years after its publication. The artful way in which Collins availed himself of the theory of Whiston respecting the corruption of the present Hebrew text, so provoked that divine, that he petitioned Lord Chancellor King, though without success, to remove Mr. Collins from the commission of the peace. In 1727 Collins, in a long letter, replied to eight sermons of Dr. Rogers on the necessity of revelation and the truth of Christianity. He died in December 1729, at his house in Harley-street. All parties agree that the moral and social character of Collins was remarkably amiable. His integrity, energy, and impartiality in the exercise of his magisterial functions commanded the highest respect, and by his conduct and writings he ardently endeavoured to promote the cause of civil and religious liberty. Collins, as a writer, is remarkable for the great shrewdness of his reasoning: and for still greater subtlety in masking the real drift of his arguments with orthodox professions. His library, which was of great extent and extremely curious, was open to all men of letters, to whom he readily communicated whatever he knew. A catalogue of his books was published by the Rev. Dr. Sykes in 1730.

COLLINS, JOHN, the son of a Nonconformist clergyman, was born at Wood Eaton, in Oxfordshire, March 5, 1624. He was at first

apprenticed to a bookseller at Oxford, but went abroad during the civil war, and served the Venetians at sea against the Turks. After the restoration he was made accountant to the Excise-office, which office was abolished before 1670. From that time he supported himself mostly by his skill in accounts. He died in London, November 10, 1683.

Collins was an early member of the Royal Society, and contributed some fair papers to its 'Transactions.' (Numbers 30, 46, 69, 159.) He also wrote several elementary works, which it is not now necessary to mention. His claims to remembrance are the intimate communication in which his attainments placed him with all men of science at home and abroad, from Newton downwards. The influence of his request and recommendation produced (as is asserted) Barrow's 'Lectures,' his 'Archimedes and Apollonius,' Branker's translation of 'Rhonius,' Kersey's 'Algebra,' and Wallis's 'History of Algebra.' The esteem in which Collins, a poor accountant, was held by men so much above him in external position, as Newton, Barrow, Wallis, &c., is honourable to all parties. The principal result however of their epistolary intercourse is the well-known work on the invention of fluxions, published in 1712, under the title of 'Commercium Epistolicum,' &c.

COLLINS, WILLIAM, the son of a hatter at Chichester, was born December 25, 1720. He was educated at Winchester, from which he went to Queen's College, Oxford; but in about half a year he removed to Magdalen, on being elected a 'demy,' or scholar, of that body. Soon after taking his Bachelor's degree he quitted the university abruptly, about 1744, and repaired to London as a literary adventurer. He won the cordial regard of Johnson, then a needy labourer in the same vocation, who, in his 'Lives of the Poets,' has spoken of him with tenderness. He tells us that "his appearance was decent and manly, his knowledge considerable, his views extensive, his conversation elegant, and his disposition cheerful. He designed many works, but his great fault was irresolution; for the frequent calls of immediate necessity broke his scheme, and suffered him to pursue no settled purpose."

Collins's 'Odes' were published on his own account in 1746. They were not popular; and it is said that, disappointed at the slowness of the sale, he burnt the remaining copies with his own hands. He was relieved from his embarrassments by a legacy from an uncle of 2000*l.*; but worse evils than poverty overclouded the rest of his life: he sank gradually into a species of melancholy and intellectual languor, to relieve which he resorted to intoxication. "Those clouds which he perceived gathering on his intellect he endeavoured to disperse by travel, and passed into France; but found himself constrained to yield to his malady, and returned. He was for some time confined in a house of lunatics, and afterwards retired to the care of his sister at Chichester, where death in 1756 came to his relief." ('Lives of Poets.')

Collins is inferior to no English lyric poet of the 18th century except Gray. His odes to 'Fear' and the 'Passions' afford the best specimens of his genius, and the well-known 'Dirge in Cymbeline' is admirable in a softer style. His poetical merits Dr. Johnson did not rightly appreciate. Mrs. Barbauld, in her edition of his works, has given a more just and favourable character of them. "He will be acknowledged to possess imagination, sweetness, bold and figurative language. His numbers dwell upon the ear, and easily fix themselves in the memory. His vein of sentiment is by turns tender and lofty, always tinged with a degree of melancholy, but not possessing any claims to originality. His originality consists in his manner, in the highly figurative garb in which he clothes abstract ideas, in the felicity of his expressions, and his skill in embodying ideal creations. As it was, he did not enjoy much of the public favour; but posterity has done him justice, and assigned him an honourable rank among those of our poets who are more distinguished by excellence than by bulk."

COLLINS, WILLIAM, R.A., was born in Great Titchfield-street, London, September 18, 1757. His father, a native of Wicklow, was the author of various works which attracted some notice in their day; among others a poem on the slave trade, a novel entitled 'Memoirs of a Picture,' and a 'Life of George Morland.' The elder Collins was a picture-dealer as well as an author, though in neither calling had he had much pecuniary success. Morland was a friend of his, and when his son began to exhibit a fondness for art and some skill in drawing, he readily obtained Morland's consent that the youth might stand beside him and watch him paint. William made tolerable progress in his pictorial studies. He entered in 1807 as a student at the Royal Academy at the same time as Etty, and in after life the two R.A.'s were fond of comparing their early drawings and subsequent progress. His earliest appearance as an exhibitor on the walls of the Royal Academy was in 1807, when he contributed two small 'Views on Millbank,' and from that time, with the exception of two years when he was away in Italy, he did not miss an exhibition for the remaining nine-and-thirty years of his life. His father's death in 1812 threw upon the young painter serious responsibilities, but these only stimulated him to increased exertions. For some time he was forced to paint portraits as the readiest means of securing a moderate income, but his landscapes and rustic groups began to make their way, and he was soon enabled to follow the bent of his genius. Almost from the first he showed his fondness for painting groups of homely children engaged in some favourite diversion, or taking part in some juvenile trick; but it was not till the year following his election as associate of the academy, which took place

in 1814, that he struck into that path—the representation of coast scenery—which perhaps most surely led him to fame and fortune. From that time—indeed, from some three or four years previous—Collins never wanted patrons; his course from first to last was one of moderate but unbroken success.

As a painter of rustic life, or rather, perhaps, we ought to say of country children and homely country scenery, Collins had hardly a rival. He watched the habits and noted every movement of the rough and unsophisticated urchins, and seldom failed to depict them in their most natural and unrestrained gaiety. Swinging on a gate, 'happy as a king'; gazing with unbounded admiration at the newly born puppy; enticing the 'stray kitten'; outwitted by the saucy robin just at the moment when making sure that the pinch of salt was about to fall on the bird's tail; exhibiting the fresh-found nest; buying the cherries,—however the youngsters were represented the truth of the portraiture was at once apparent: and some quaint or novel incident was sure to be added, which marked more graphically than even the principal feature, the keenness of the painter's eye, and the skilfulness of his hand. In his coast scenes these characteristics were equally visible; and equally evident also was his happiness in his choice of a subject. In neither was there ever any attempt to surprise or excite. The painter knew exactly what was within the range of his powers. He saw his subject clearly; knew what he meant to accomplish, and seldom failed to accomplish it. Hence his pictures, apart altogether from their artistic skill, always appear to have a purpose. They show that there was something which really interested and pleased the painter, and as a consequence the spectator is himself also interested and pleased. But their technical qualities are of a very high order. Collins had an excellent eye for form, chiaroscuro, and colour. From the first he painted always with the greatest conscientiousness. He never slighted any part of his work, and always did his best; and hence his course exhibited continual progress. In his earlier pictures there may be traced something of feebleness arising from an excess of anxiety to render his work perfect. But, with increased command over his materials, he gradually acquired greater breadth and vigour; and though he always continued to finish his pictures with scrupulous care, he early recognised the truth of the axiom that mere correctness of detail is not finish. And then with this technical and manipulative skill there was shown a close study of nature. The receding or advancing wave, the moist or parched sand, the teeming clouds, every phase and every feature of earth, and sea, and sky, were faithfully observed and unobtrusively represented. No wonder that in a country like this, where every one who can turns to the scenery of nature with never-tiring zest, such faithful transcripts of her commoner aspects, animated too by life-like groups of those peasant children who, to city dwellers at least, always seem so genuine a part of the scenery, should have found abundant admirers and ready purchasers.

In 1836 Mr. Collins visited Italy, and remained there nearly two years; diligently availing himself of every opportunity of examining the works of the great masters, but at the same time filling his sketch-book with transcripts of the more striking features of the natural scenery and careful studies of the monks and peasants, and, above all, of the children, in that land of lazy enjoyment and perennial beauty. On his return in 1839, he sent to the Academy as the fruits of his journey two views in Naples: one with groups of young lazzaroni playing the game of 'arravoglio'; the other with 'Poor Travellers at the Door of a Capuchin Convent'; also a view at Subiaco. They manifested an increase of artistic knowledge and power, and were greatly admired. The next year he appeared in quite a new branch of art, that of historical painting. With increasing years, Mr. Collins had been increasing in the depth and earnestness of his devotional feelings, and he not unnaturally felt a strong desire to represent in his own way the scenes on which his imagination loved to dwell. 'Our Saviour with the Doctors in the Temple' accordingly appeared on the Academy walls in 1840; 'The Two Disciples at Emmaus' in 1841. They of course attracted attention, and supplied a topic of conversation in art circles, nor did they fail of purchasers; but it was felt to be a positive relief by the great body of the painter's admirers when, after a little coying with native scenery in one or two small pictures exhibited in 1842, he reappeared with all his old freshness and vigour in 1843 and succeeding years, with his 'Windy Days,' and 'Cromer Sands,' and 'Prawn Fishers,' and 'Cottage Doors,' and the like; and never did Collins enjoy more general popularity as a painter than in these last three or four years of his life.

Collins's journey to Italy not only led him to waste on uncongenial subjects several of the best years of his life, but during it he laid the foundation of the disease which shortened his days. It was not however till 1844 that disease of the heart declared itself in a decided form; but from that time he obtained only temporary relief from its distressing symptoms, though he laboured on at his calling with unabated industry, and almost to the last with little perceptible loss of power. He died on the 17th of February 1847, at his house, Devonport-street, Hyde Park Gardens.

Collins was elected R.A. in 1820; in 1840 he was appointed librarian to the Academy, but resigned it on finding that its duties required a greater devotion of time than he could afford to give to them. Collins was, as we have already noticed, fortunate in early finding friendly and

liberal patrons. As early as 1818 one of his Norfolk coast scenes obtained a place in the Royal Collection, and George IV. subsequently commissioned a companion to it—'Prawn Fishers at Hastings.' Yet, though so much in request, the painter never obtained any of those extravagant sums for his works which we sometimes find popular painters demanding. The largest sum he ever received for a picture was 500 guineas, from Sir Robert Peel, for his large and admirable 'Frost Scene.' The paintings of Collins are to be met with in most of the great private collections in this country. In the National Gallery the forger would look in vain for a specimen of this, one of the most thoroughly national of English painters. Fortunately, the Vernon collection to a certain extent supplies the deficiency: there may be seen an excellent example of his delineations of rustic enjoyment in 'Happy as a King,' painted in 1836; one of his pleasant coast-scenes, in 'The Shrimpers—Evening,' painted in 1831; and his 'Fisherman's Widow,' painted in 1835. Mr. Collins married in 1822 the daughter of Mr. Goiden, A.R.A., and sister of Mrs. Carpenter, the well-known portrait-painter; and by her had two sons, who claim a brief notice.

* WILLIAM WILKIE COLLINS was born in 1825, and has studied with a view to the bar, but is known to the public as a writer, chiefly of works of fiction. The principal works published with his name are, an excellent 'Life of William Collins, R.A.,' 2 vols. 8vo, 1848, from which we have drawn the materials for the preceding notice; the novels 'Antonina,' 'Basil,' 'Hide and Seek,' and a series of stories originally published in 'Household Words,' with some descriptive sketches of Cornish scenery, entitled 'Rambles beyond Railways;' but Mr. Collins has also contributed extensively to various periodicals.

* CHARLES ALLSTON COLLINS, who is some two years younger, is a painter, and has acquired some distinction as a disciple of the school known as that of the Pre-Raphaelites.

COLLOT D'HERBOIS, JEAN MARIE, was born at Paris in 1750. He was in his fortieth year at the taking of the Bastille (July 14, 1789), having for twenty years led the life of a strolling player. During this part of his career he had visited Geneva, where he first imbibed his republican ideas; and then Lyon, where he was hissed off the stage—a disgrace which he afterwards most fearfully avenged. Some natural talents however he must have possessed, for he produced many dramatic pieces; and one of these, 'Le Paysan Magistrat,' was very successful, and kept the stage for more than ten years. He first attracted public notice by his popular 'Almanach du Père Gerard,' in January 1792, for which he received a prize from the Jacobin Society. His next step was his public display of forty liberated convicts, whom he had caused to be released from Brest, and whom he paraded along the whole line of the Boulevards, in a grand triumphal car, surmounted with flags and laurel-wreaths. Collot stood up in the centre of the group, and harangued the multitude. These convicts wore their red caps, to wear which soon after became the fashion. This audacious exhibition made Collot a public man. He was elected in September to sit in the Convention as one of the deputies for Paris. Absent on a mission in December, he did not take part in the trial of Louis XVI., but wrote to the Convention that he voted for the king's death. When the Committee of Public Safety was formed, Collot became a leading member, and his sanguinary proscriptions far exceeded those of Robespierre. It was this fiery zeal, and a certain inflated arrogance of speech, joined to a stentorian voice, which caused him to be sent on several missions into the departments, to propagate the principles of the revolution.

In November 1793 Collot was despatched to Lyon, with his colleague Fouché, and in this ill-fated city 1600 persons were destroyed, as well by discharges of artillery as by the guillotine. Moreover, on the 21st Vendémiaire, a decree was issued that Lyon was to be razed to the ground. This ferocious monster made it a crime to look even dejected, and ordered "that all persons were to be treated as suspected in whose countenances any signs of either grief or pity could be traced." On the 23rd of May 1794 Collot was attacked, on his return home after midnight, by a man named Admiral, who discharged two pistols at him, but without effect. The éclat produced by this event increased Collot's influence in the Convention, and from that hour the fatal eye of the dictator was fixed upon him. During the struggle which followed between them, Collot became President of the Convention, July 19, 1794; and nine days after, Robespierre (the remnants of all the discomfited factions having united to overthrow him) was sent to the scaffold. But now his own fall was at hand. Denounced first by Leclercq of Versailles, and then by the butcher Legendre, October 3, 1794, Collot was condemned in the following March to be transported to Cayenne, with Billaud Varenne, and Barrère. Here he lingered for a few months, and having caught the fever natural to the climate, he expired amidst convulsions of great agony, January 8, 1796.

COLMAN, GEORGE, commonly called 'the Elder,' was the son of Francis Colman, Esq., British resident at the court of the Grand Duke of Tuscany, by a sister of Anna-Maria Pulteney, countess of Bath. He was born at Florence about 1733, and was educated at Westminster. He afterwards became a student of Christ Church, Oxford, and forming an acquaintance with Mr. Bonnel Thornton, published, in conjunction with that gentleman, the periodical paper called 'The Connoisseur.' Fixing on the law for a profession, he was entered at Lincoln's Inn, and duly called to the bar. In 1760 he produced his first dramatic piece, entitled 'Polly Honeycomb,' at Drury Lane

with great success. This was followed in 1761 by the comedy of 'The Jealous Wife,' and in 1766 by that of 'The Clandestine Marriage,' written in conjunction with Mr. Garneke. In 1767 he united with Messrs. Harris, Rutherford, and Powell in the purchase of Covent Garden Theatre, and became the acting manager, in which situation he continued seven years, when he sold his share to Mr. Leake. In 1777 he purchased of Mr. Foote the little theatre in the Haymarket. In 1785 Mr. Colman was seized with the palsy, and four years afterwards manifested symptoms of an alienation of mind, which gradually increasing terminated in a state of idiotism. He died at Paddington on the 14th of August 1794, aged sixty-two. Mr. Colman, besides writing and adapting upwards of thirty dramatic pieces, was the author of a very spirited translation in blank verse of Terence, a translation of and commentary on Horace's 'Art of Poetry,' and several fugitive pieces.

COLMAN, GEORGE, 'the Younger,' son of the preceding, was born October 21, 1762. He proceeded from Westminster school to Christ Church, Oxford, and was thence sent by his father to King's College, Old Aberdeen, and on his return to London was entered of the Temple. The law however had few charms for him, and following the example of his father, he soon commenced writing for the stage. During the illness of Mr. Colman, sen., he directed the Haymarket Theatre, and on the death of his father, George III. transferred the patent to him. Mr. Colman, jun., was appointed by George IV. Escon of the Yeoman Guard (an office which he afterwards by permission disposed of), and by the Duke of Montrose, then Lord Chamberlain, Examiner of Plays, which situation he held till his death, October 26, 1836. He was twice married, his second wife being the popular actress Mrs. Gibbs. Mr. Colman was the author of several excellent plays and farces: amongst the most popular are 'John Bull' (for which comedy he received the largest sum of money up to that time ever paid for any drama), 'The Poor Gentleman,' 'Heir at Law,' 'Inkle and Yarico,' 'Iron Chest,' 'Mountaineers,' 'Surrender of Calais,' 'Ways and Means,' 'Review,' 'Blue Beard,' 'X. Y. Z.,' and 'Love Laughs at Locksmiths.' He also wrote the well-known comic tales entitled 'Broad Grins,' 'Poetical Vagaries,' &c., and a variety of smaller poems. His last literary work was the publication of his own memoirs up to the time of his entering on the management of the Haymarket, in 2 vols. 8vo.

COLONNA is the name of one of the oldest and most illustrious families of Italy. About 1050 it became possessed of the feudal estate of La Colonna on the Tusculan mount. Pietro, lord of Colonna, who lived in the 12th century, is one of the earliest of the family recorded in history. His son Giovanni was made cardinal by Honorius III. in 1216. The family afterwards divided into several branches, one of which became princes of Palestrina; another dukes of Zagarolo; while others were made dukes of Traietto and counts of Fondi, dukes of Paliano and Tagliacozzo, and princes of Sonnino and Stigliano, in the kingdom of Naples. Moreri, art. 'Colonna,' gives their respective genealogies. At one time they were possessed of a great portion of the Campagna of Rome, besides large estates in Abruzzo. The Colonna were of the Ghibeline party: their rivalry with the Orsini and other Roman barons, and their quarrels with several popes, especially with Boniface VIII., are recorded in the history of the middle ages. In the early part of the 15th century, one of the Colonna family was made pope under the name of Martin V. A century later, two cousins of the same family, Fabrizio and Prospero Colonna, distinguished themselves in the service of Ferdinand of Aragon, and afterwards of Charles V., against the French in Italy. Several of the same family attained high honours in the kingdom of Naples and in Spain, and others are numbered among the cardinals of the Roman church. Some branches of the family have become extinct, but the Stigliano of Naples and the Soiarra Colonna at Rome continue to exist. The Colonna have an extensive palace with gardens on the slope of the Quirinal at Rome.

COLONNA, FRA FRANCESCO, a learned Dominican and architectural writer of the 15th century, was author of a very singular, strangely rhapsodical, mystical, and fantastical work, with the equally fantastical title of 'Hyperotomachia Poliphili,' first printed by Aldus in 1499. This extraordinary production, which is a sort of romance, or rather vision, interwoven with descriptions of imaginary edifices, has drawn forth the most opposite opinions, being treated as contemptuously by some as it has been extravagantly extolled by others. While Milizia, Nagler, and many more, speak of it as a mere tissue of absurdities, others, who ought to be competent judges of it in that respect, praise it as a work highly deserving to be studied by architects. As such, Mr. Cockerell, professor of architecture at the Royal Academy, earnestly recommended it in one of his lectures (1845), representing it to be equally calculated to inspire with a passion for architecture, as 'Robinson Crusoe' with a yearning after adventures on the sea. From this it would naturally be inferred that the work must be at all events attractive and engaging, and abound with highly graphic and picturesque descriptions; whereas it is precisely the reverse—so obscure in many parts as to be scarcely intelligible at all, and written in a confused jargon of Italian, Latin, and other languages and dialects. He must be exceedingly clever, observes Tiraboschi, who can, I will not say understand the book, but even tell in what language it is composed.

Another edition of the 'Hypnerotomachia' was published at Venice by the younger of the Aldi in 1545. It has been twice translated into French: first by Beroalde de Verville (folio, Paris, 1600); and again by the architect Legrand, under the title of 'Songe de Polyphile,' in 2 vols. 12mo, printed by Didot, 1804, and reprinted by Bodoni in a splendid quarto, 1811. Legrand intended to illustrate it by a separate atlas of engravings to it, which had they appeared would doubtless have been of very different character from the wood-cut figures of the original and the copies from it. Those in Beroalde de Verville's translation are said to have been designed by no less an artist than the celebrated sculptor Jean Goujon; but as far as they are at all architectural in their subjects, which is the case with but few of them, they do not materially differ from the earlier ones, and like them are exceedingly rude both as to drawing and design. Temanza (TEMANZA, TOMMASO), who is among the warm admirers of the 'Hypnerotomachia,' speaks of it at considerable length in his 'Life of Colonna.'

After this bibliographical notice of the singular work which has obtained for him so much repute of contradictory kinds, the history of the writer himself may be briefly told. He was born at Venice, about the year 1438, and in his youth fell in love with Ippolita, the niece of Teodoro Lelio, bishop of Trevigi, in the Venetian territory; and she is the lady whom he has celebrated under the abridged name Polia, in his allegorical romance, and who is supposed to have died shortly after her uncle, in 1466. Colonna then took the Dominican habit, and entered the monastery of Santi Giovanni e Paolo at Venice, where he died in July 1527, at the age of ninety-four.

COLONNA, VITTORIA, born in 1490, was the daughter of Fabrizio Colonna, Great Constable of the kingdom of Naples, and of Anna, the daughter of Federico di Montefeltro, duke of Urbino. At the age of seventeen she married Francis Davalos, son of the Marquis of Pescara, who soon after came to the title at the death of his father. Pescara served with distinction in the armies of Charles V., and contributed greatly to the gaining of the battle of Pavia, in which he was wounded. On his recovery, appearing dissatisfied with Charles V., he was sound by Morone, the old minister of the Duke Sforza of Milan, as to his willingness to enter into a plot concerted with the other Italian princes, by which the Spanish troops were to be driven out of Milan and Lombardy, and ultimately from all Italy. Pescara was then commander-in-chief of Charles's army in Italy. He was promised the kingdom of Naples as a reward for his assistance in the execution of this plot. Pescara appeared to assent at first, but afterwards secretly informed Charles V., who is said however to have had already some previous information on the subject, and who ordered him to take possession of the principal towns of Lombardy, and to arrest Morone, who was soon after put to death. It is reported that Vittoria Colonna contributed by her remonstrances on this occasion to retain her husband within the bounds of his allegiance to the emperor. Shortly after Pescara died, towards the end of 1525, aged thirty-six years, and was succeeded by his cousin the Marquis del Vasto in the command of the imperial army in Italy. Vittoria Colonna, who was inconsolable for the death of her husband, determined on spending the remainder of her life in religious seclusion. She wrote several poetical effusions, lamenting the death of her husband, and also upon religious subjects. ('Rime Spirituali di Vittoria Colonna,' Venezia, 1548.) Her beauty, her talents, and her piety were extolled by her contemporaries, and among others by Michel Angelo, and by Ariosto, in canto 37 of the 'Furioso.' She died in 1547, at Rome, and was styled "a model of Italian matrons." (Corniani; Tiraboschi, &c.)

COLQUHOUN, PATRICK, a statist and political economist, was born at Dumbarton, on the 14th of March 1746. He appears to have in his youth struggled with difficulties, which prevented his receiving a liberal education. At an early period of life—apparently when he was little more than sixteen years old—he endeavoured to push his fortune in the colony of Virginia. In 1766 he returned to Scotland and settled in Glasgow, where he subsequently became instrumental in the establishment of a coffee-house or news-room, the Exchange, the Chamber of Commerce, and various other public institutions. He afterwards visited the continent, with the view of making his countrymen acquainted with the species of textile fabrics which would give our manufactures the best chances of success in the continental markets; and the subsequent rise and progress of our muslin trade are said to have been produced by his exertions on that occasion. In 1789 he settled in London, where he soon afterwards directed his attention to the important question, whether the various police systems of the metropolis were as efficient as they might be made towards the accomplishment of their legitimate end—the suppression of crime. He was one of the three stipendiary justices of peace appointed in 1792. In 1796 he published his well-known work, 'A Treatise on the Police of the Metropolis, explaining the various crimes and misdemeanours which at present are felt as a pressure on the community, and suggesting remedies.' In a letter to Lord Colchester, in 1798, Bentham states that 7500 copies of this work had then been sold. Although changes both in the police regulations and the state of society have superseded the information contained in this work, it is still frequently referred to, and its statistical data, and views of the proper principles of police regulations, had much influence in the furtherance of that reform of the metropolitan police which took place so many years after the book was published. In

1800 he drew, with the assistance of Bentham, of whom he was a valued friend, the Thames Police Act (40 Geo. III. c. 87), a measure now understood to have been suggested by Mr. Harriot. In the same year he published 'A Treatise on the Commerce and Police of the River Thames; containing an Historical View of the Trade of the Port of London; and suggesting means of preventing the depredations thereon, by a legislative system of River Police.' Mr. Colquhoun was a great promoter of the system of charity-schools, holding the opinion, which is every day obtaining additional adherents, that the education of the people is the main protection of society from those social evils which penal legislation can but partially cure when they have broken out. He died on the 25th of April 1820.

COLSON, JOHN, born about the beginning of the 18th century, studied at Emmanuel College, Cambridge, and was master at the free-school at Rochester till 1739, when he succeeded Sanderson as Lucasian professor at Cambridge. He died in 1760. He is worthy to be remembered for his English edition of Newton's Fluxions, London, 1736; and his translation of the Analytical Institutions of Maria Agnesi, which lay in manuscript till 1801, when it was published by the Rev. John Hellins at the expense of Baron Masers.

COLUMBA, commonly called the Apostle of the Highlanders, or Sooto-Irish, is believed to have been one of the earliest teachers of Christianity in Scotland, and is known in history as the founder of the abbey and college of Iona in the Western Isles. He was a native of Ireland: his biographers give his pedigree with great precision, but even if its precise accuracy could be trusted, its repetition here would afford the reader nothing more valuable than a series of strange names. He is said to have been born in the year 521. According to the best collations of recent investigators, he arrived in Scotland in the year 563. The island of Hi or Iona, where he established himself with his disciples, may be presumed, from the vestiges of a worship earlier than Christianity still extant there, and commonly called Druidical remains, to have been a seat of the pagan worship of the day, and it is probable that Columba desired to attack the lion in his den. The greater part of the neighbouring west coast of Scotland was peopled by the Scots, who had emigrated from Ireland; the districts south of Iona, and the broad tracts of comparatively level land stretching eastward, were inhabited by the people called Picts. Columba is said to have established an equal influence with both races. In the much debated question whether the Picts were of Celtic or Teutonic origin, a passage in Adamnan's 'Life of Columba' gives perhaps the most distinct, though very limited, evidence that exists on the subject. It states that Columba, who as an Irishman must have been of the same Celtic origin as the Scots or Irish Dalriads who surrounded him on the west coast, required an interpreter when he communicated with the king of the Picts. A translation of this work, with critical comments, was published in 1793, with the title 'The Life of St. Columba, the Apostle and Patron Saint of the ancient Scots and Picts,' by John Smith, D.D., a work full of very absurd blunders. Adamnan's 'Life' contains few biographical facts which can be depended on, but it is a very curious memorial of the manners of the day. Even the dreams and miracles with which it is crowded are instructive when critically examined. Columba is believed to have been the founder of the Culdees, and in connection not only with them, but with the pagan rites which he superseded, his memory is traditionally preserved in the highlands of Scotland. There is a Highland proverb, of which the translation is—"Earth, earth, on the mouth of Oran, that he may blab no more." The tradition connected with this is, that Oran was one of the followers of Columba, who, as a sacrifice at the building of Iona, was buried, whether alive or dead is not stated. This tradition, which is given as the version of the pagan priests, says that Columba opened the grave three days afterwards, and Oran told him that hell was not such a place as he reported it to be. Whereupon Columba, to prevent his impiously communicating the idea to others, called out to those who were with him in the words of the proverb. Columba is said to have died in the year 597. There is an account of his life in Chalmers' 'Caledonia,' i. 311, and in Jamieson's 'Account of the Culdees.'

COLUMBUS, CHRISTOPHER (a name latinised from the Italian Colombo, and the Spanish Colon); was born at Genoa, about the year 1445 or 1446. The date of his birth is however only inferred from two of his letters to Ferdinand and Isabella, in one of which he states that he went to sea at the age of fourteen, and in another dated 1501, that he had been in maritime service nearly forty years: his place of birth is twice stated in his will. But the history of his early days is involved in obscurity. His son, Fernando, unwilling, from mistaken pride, to reveal the indigence and humble condition from which his father emerged, has left the biography of Columbus very incomplete. The father of Columbus, who was a wool-comber, sent him to Pavia, then the great school of learning in Lombardy; but Columbus having shown a taste for geometry, geography, and astronomy, or as it was then termed astrology, went to sea at fourteen years of age. In addition to the hardy encounters and dangers attending the sea-faring life of that age, he was often under the rigid discipline of an old relation, Colombo, who carried on a predatory warfare against Mohammedans and Venetians, the great rivals of the Genoese. In February 1487, Columbus, in order to ascertain whether Iceland was inhabited, advanced 100 leagues beyond it, and was astonished at not finding the

sea frozen. He also visited the Portuguese fort of St. George la Mina, on the coast of Guinea.

About the year 1470, he settled at Lisbon, then the great resort of travellers and navigators, whom Prince Henry highly encouraged. Here Columbus married the daughter of an Italian, called Patestrello, who had colonised and who governed the island of Porto Santo, and whose papers, charts, and journals, were highly serviceable to Columbus in his occasional expeditions to Madeira, the Canaries, the Azores, and the Portuguese settlements of Africa, and for the construction of maps and charts, which he sold to support his family, and his aged father at Genoa, as well as to defray the education of his younger brothers. Columbus resided also some time at the island of Porto Santo, which had not long been discovered, a circumstance which at a period of great excitement and expectation as to maritime discovery, kindled his mind to enthusiasm, which was heightened by the allusions in the Bible to the ultimate universal diffusion of the gospel, which Columbus hoped that he was predestined to extend to the eastern extremity of Asia. He considered his projected discoveries as only a means to this end, and also for supplying him with ample treasures to furnish an army of 50,000 foot soldiers and 5000 horse for the recovery of the holy sepulchre. Moreover the legends of the island of Cipango (Japan), of Mango (Southern China), and Cathay, the opinions of the ancients, the travels of the moderns, the conjectured sphericity of the earth, its supposed smallness, and the imaginary prolongation of Asia to the east, all this presumptive evidence, added to the recent application of the astrolabe to navigation, gave him so firm a conviction of the practicability of crossing the Atlantic, and of landing on the eastern shores of Asia, that, after long delays, and repeated disappointments and struggles with poverty, he never made any abatement in those conditions which appeared to all the states (Genoa, Portugal, Genoa again, Venice, France, England, and Spain) to whom he made proposals to be the extravagant demands of a mere adventurer. John II. of Portugal, after having referred the project to a maritime junta, and to his council, both of whom regarded it as visionary, nevertheless sent a caravel under the pretext of taking provisions to the Cape Verd Islands, but with secret instructions to try the route marked in the papers of Columbus. The pilots however losing all courage, put back to Lisbon, and ridiculed the scheme. Indignant at such duplicity, Columbus sought patronage elsewhere, and sent his brother Bartholomew to make proposals to Henry VII. of England.

In 1484 Columbus arrived at Palos de Moguer in Andalusia. Stopping one day at the Franciscan convent of La Rabida to beg some bread and water for his child, the guardian or superior, Juan Perez Marchena, passing by, and entering into conversation with the stranger, was so struck with the grandeur of his views, that he detained him as a guest, and sent for the physician of Palos, Garcia Fernandez, to discuss the project. Now, for the first time, it began to be listened to with admiration. Marchena, taking charge of the maintenance and education of the young son of Columbus, gave the father a letter of introduction to the confessor of Isabella, Fernando de Talavera. This expected patron treated the wandering petitioner as a dreaming speculator, and a needy applicant for bread. His humble dress, and his want of connections and academic honour, formed, in the eyes of all the courtiers, an inexplicable contrast with his brilliant proposals and aspirations. But indigence, contumely, and indignities of all kinds, could not shake the perseverance of Columbus. At last, through Cardinal Mendoza, he obtained an audience of King Ferdinand, who referred the matter to a conference of learned monks, which was held in the convent of the Dominicans of St. Stephen at Salamanca. At the very opening of the discussion Columbus was assailed with biblical objections, against which no mathematical demonstration was admitted: but he met them on their own ground. He poured forth texts and predictions as mystical types of his proposed discovery. The inquiry however, after intentional procrastination, ended in an unfavourable report. After seven years wasted at the Spanish court in solicitation, occasional hope, and bitter disappointment, a connection with a lady of Cordoba, Beatriz Enriquez, prevented his entirely breaking with Spain. She was the mother of his second son, Ferdinand, who became his historian, and whom he always treated on terms of perfect equality with his legitimate son Diego. Columbus was now about to apply to the French king, from whom he had received a letter of encouragement; when, returning for his eldest son, Diego, to La Rabida, the warm-hearted friar Marchena endeavoured to dissuade him from this project, sent again for the physician, Garcia Fernandez, and also called to their council Alonso Pinzon. This distinguished navigator not only approved of the projected voyage, but offered to engage in it with his money and in person, and even to defray the expenses of a new application at court.

The ardent friar lost no time in writing directly to Queen Isabella, and on her requesting a verbal explanation of the subject, he immediately went to Santa Fé, where she was then superintending with Ferdinand the close investment of Granada. Isabella, who had never heard the proposition urged with such honest zeal, enthusiasm, and eloquence, and who was besides more open to noble impulses than her husband, was at last moved in behalf of Columbus, but her favour was checked by her confessor Talavera, who, being now raised to the see of Granada, was more astonished than ever at the lofty claims of this indigent and

threadbare solicitor. These claims would be exorbitant in case of success, he observed; how unreasonable then would they appear in case of failure, which was almost sure to happen, and which would prove the gross credulity of the Spanish monarchs. More moderate, yet highly honourable and advantageous terms were offered to Columbus, but he considered them beneath the dignity of his enterprise, and determined once more to abandon Spain for ever.

Some friends, who considered his departure as an irreparable loss, once more remonstrated with Isabella, who at last offered her own jewels to defray the expenses of the expedition, and thus overcame the coolness of Ferdinand. Accordingly a messenger was sent to overtake Columbus, who, after some hesitation, returned to Santa Fé. Stipulations were at last signed by Ferdinand and Isabella at Granada on the 17th of April 1492.

On Friday, the 3rd of August 1492, Columbus, as admiral of the seas and lands which he expected to discover, set sail from the bar of Saltes, near Palos, with three vessels and 120 men, who were full of doubts and fears, and were partly pressed into the service. Two of these vessels were caravels, or light barques, no better than our river and coasting craft. This however Columbus considered an advantage, as it would afford him the means of examining shallow rivers and harbours. On the 5th one of the vessels had her rudder broken; but fortunately on the 6th he perceived, as he expected, the Canaries, where he refitted. On the 6th of September he hastily quitted Gomera, to avoid three frigates which were sent against him by the king of Portugal from spite at seeing Columbus engaged in the Spanish service. As soon as the Canaries were out of sight, consternation and despair spread among the crews, and the admiral was obliged to leave them in ignorance of the progress they were making. The stratagem he adopted for this purpose, and in which he persevered throughout the voyage, was that of keeping two reckonings, one true and private for his own guidance, the other merely for the crews, to keep them in ignorance of the great distance they were advancing. He also forbade the variation of the needle, which he observed on the 13th of September, about 200 leagues west of the island of Ferro, to be mentioned to the crew, till it was noticed also by his pilots, when he succeeded in allaying their terrors with his ready ingenuity to meet any emergency, by ascribing the phenomenon to the movement of the pole star. The whole expedition being founded on the presumption of finding land to the west, Columbus kept steadily to this course, lest he should appear to doubt and waver, and never went in search of islands, which floating weeds, birds, and other indications gave him reason to believe were not far off.

On the 20th of September the wind veered round to the south-west; and although unfavourable to the expedition, this circumstance cheered the dismayed crew, who were alarmed at its continuance from the east, which seemed to preclude all hope of their return. Repeated disappointments made the crews at last regard all signs of land as mere delusions. On the evening of the 10th of October they exclaimed more violently than ever against the obstinacy of an ambitious desperado, in tempting fate on a boundless sea; they even meditated throwing the admiral overboard and directing their course homeward. Columbus, for the last time, tried to pacify them in a friendly manner; but this only increased their clamour. He then assumed a decided tone, acted in open defiance of his crews, and his situation became desperate. That he ever yielded to his men, rests on no other authority than that of Oviedo, a writer of inferior credit, who was grossly misled by a pilot of the name of Hernes Perez Matheos, an enemy to Columbus. Fortunately, on the 11th, the manifestations of land were such as to convince the most dejected. Accordingly, after the evening prayer, Columbus ordered a careful look-out, and himself remained on the high stern of his vessel from ten o'clock, when he observed glimmerings of light, as he supposed, on shore, till two in the morning, when the foremost vessel fired a gun as a signal of land having been discovered. Not an eye was closed that night, all waiting with intense feeling for the dawn of the 12th of October 1492, which was to reveal the great mystery of the ocean, whether it was bounded by a savage wilderness, or by spicy groves and splendid cities, possibly the very Cipango, the constant object of the golden fancies of the admiral. With tears of joy, after fervid thanksgivings, Columbus kissed the earth on which he landed, and with great solemnity planted the cross in the New World at Guanahani, or San Salvador, one of the Guayan, Lucayan, or Bahama Islands. Those who had lately been most in despair were now the most extravagant in their joy. The most mutinous and outrageous thronged closest round the admiral, and crouched at the feet of a man who in their eyes had already wealth and honours in his gift.

The naked and painted natives, when they had recovered from their fright, regarded the white men, by whose confidence they were soon won, as visitors from the skies which bounded their horizon; they received from them with transport toys and trinkets, fragments of glass, and earthenware, as celestial presents possessing a supernatural virtue. They brought in exchange cotton-yarn and cassava bread, which, as it keeps longer than wheaten bread, was highly acceptable to the Spaniards.

On the 24th Columbus set out in quest of gold and Cipango. After discovering Concepcion, Ezuma, and Isla Larga, Cuba broke upon him like an elysium; he no longer doubted that this beautiful

land was the real Cipango. When this delusion was over, he fancied Cuba to be not far from Mango and Cathay, so brilliantly depicted in his great oracle, Marco Polo. To the time of his death Columbus believed Cuba to be a part of the mainland of India, and it was owing to this mistake that the appellation of Indians was extended to all the Aborigines of the Americas. He next took Hayti, or Santo Domingo, for the ancient Ophir, the sources of the riches of Solomon, but he gave it the Latin diminutive of Hispaniola, from its resembling the fairest tracts of Spain. Leaving here the germ of a future colony, he set sail homeward the 4th of January 1493. A dreadful storm overtook him on the 12th of February. Columbus fearing the loss of his discovery more than the loss of life, retired to write two copies of a short account of it. He wrapped them in wax, inclosed them in two separate casks, one of which he threw into the sea, and the other he placed on the poop of his vessel, that it might float in case she should sink. Happily the storm subsided, but another drove him off the mouth of the Tagus on the 4th of March; and although distrustful of the Portuguese, he was obliged to take shelter there. At last he landed triumphantly at Palos, the 15th of March 1493. In his journey through Spain, he received princely honours all his way to Barcelona, where the court had gone. His entrance here, with some of the natives, and with the arms and utensils of the discovered islands, was a triumph as striking and more glorious than that of a conqueror. Ferdinand and Isabella received him seated in state, rose as he approached, raised him as he knelt to kiss their hands, and ordered him to be seated in their presence.

On the 25th of September 1493, Columbus left Cadiz on a second expedition, with 17 ships and 1500 men. He discovered the Caribbee Islands, Puerto Rico, and Jamaica; and after repeated mutinies of his colonists, and great hardships, he returned against the tradewinds to Cadiz, June 11, 1496. Having dispelled all the calumnies that had been accumulated upon him, Columbus embarked the 30th of May 1498 at San Lucar de Barrameda, on a third expedition, with only six vessels. In this voyage he discovered La Trinidad, the mouth of the Orinoco (which river he imagined to proceed from the tree of life in the midst of Paradise, the situation of which was then supposed to be in the remotest parts of the east), the coast of Paria, and the Margarita and Cubagua Islands. On the 14th of August he bore away for Hispaniola to recruit his health. The dissensions which arose here, the calumnies of miscreants who had been shipped off to Spain, countenanced as they were by envious courtiers at home, the unproductiveness of the new settlement, and regret at having vested such high powers in a subject and a foreigner, who could now be dispensed with, induced Ferdinand, in July 1500, to despatch Francisco Bovadilla to supersede Columbus, and bring him back in chains. Valledo, the officer who had him in charge, and Martin, the master of the caravel, would have taken his chains off; but Columbus proudly said, "I will wear them till the king orders otherwise, and will preserve them as memorials of his gratitude." He hung them up in his cabinet, and requested they should be buried in his grave. The general burst of indignation at Cadiz, which was echoed throughout Spain, on the arrival of Columbus in fetters, compelled Ferdinand himself to disclaim all knowledge of the shameful transaction. But still the king kept Columbus in attendance for nine months, wasting his time in fruitless solicitations for redress; and at last appointed Nicholas Ovando governor of Hispaniola in his place.

With restricted powers and a broken frame, but with his ever-soaring and irrepressible enthusiasm, Columbus sailed from Cadiz again on the 9th of May 1502, with four caravels and 150 men, in search of a passage to the East Indies near the Isthmus of Darien, which should supersede that of Vasco de Gama. Being denied relief and even shelter at Santo Domingo, he was swept away by the currents to the north-west; he however visited Yucatan and Mexico, and at last reached Truxillo, whence he coasted Honduras, the Mosquito shore, Costa Rica, Veragua, as far as the point which he called El Retrete, where the recent westward coasting of Bastides had terminated. But here, on the 5th of December, he gave up his splendid vision, and yielded to the clamours of his crews to return in search of gold to Veragua, a country which he himself mistook for the Aurea Chersonesus of the ancients.

Finally, the fierce resistance of the natives and the crazy state of his ships forced him, at the close of April, 1503, to make the best of his way for Hispaniola with only two crowded wrecks, which, being incapable of keeping the sea, came, on the 24th of June, to anchor at Jamaica. After famine and despair had occasioned a series of mutinies and disasters far greater than any that he had yet experienced, he at last arrived, on the 13th of August, at Santo Domingo. Here he exhausted his funds in relieving his crews, extending his generosity even to those who had been most outrageous. Sailing homewards on the 12th of September, he anchored his tempest-tossed and shattered bark at San Lucar, the 7th of November 1504. From San Lucar he proceeded to Sevilla, where he soon after received the news of the death of his patroness Isabella. He was detained by illness till the spring of 1505, when he arrived, wearied and exhausted, at Segovia, to have only another courtly denial of redress, and to linger a year longer in neglect, poverty, and pain, till death gave him relief at Valladolid on the 20th of May 1506. Thus ended a noble and glorious

career, inseparably connected with the records of the injustice and ingratitude of kings. To make some amends for the sorrows and wrongs of this great man, his remains received a pompous funeral, and his grave and coat of arms the following motto:—

"A Castilla y a Leon
Nuevo Mundo dio Colon."

Although Sebastian Cabot discovered Newfoundland and Labrador in June 1497, and Columbus did not touch the American continent till he visited the coast of Paria in August 1498, yet Columbus first reached Guanahani, and what may properly be denominated the Columbian Archipelago, and is really the discoverer of the New World. Rafn (*'Antiquitates Americanae,'* 1845) seems to have established—if the passages he quotes from the Sagas are not interpolations—not merely that the Northmen discovered the American continent, but that they formed settlements on the coast between Boston and New York, in or before the 11th century. Humboldt, a great authority in such matters, has adopted this view (*'Kosmos,'* ii. 234, and Notes): Bancroft (*'Hist. of United States,'* chap. i.) examines and rejects it. The legend of an Irish discovery and colonisation has found no recent supporters among the learned.

The voyage of one Antonio Sanchez from the Canaries to Hayti in 1484, mentioned by the Inca Garcilaso and some other Spanish writers, is regarded as a fable. The accounts however of Spaniards and Portuguese who had sailed westward so far as to perceive indications of land, were useful to Columbus, according to his own avowal. Ferdinand and Isabella, in a written declaration of the 4th of August 1494, ascribe the new discoveries to Columbus. Amerigo Vespucci, whose name was afterwards given to the new hemisphere, did not see it till he accompanied Ojeda, as a pilot, to the coast of Paria in 1499.

(The following are the principal authorities for the Life of Columbus:—*Navigazione del Re di Castiglia delle Isole e Paesi nuovamente ritrovati*, and the Latin translation, *Navigatio Christophori Colombi*, Vienna, 1507; *Itinerarium Portugalensium*, Milan, 1508; Grinæus, *Novus Orbis Regionum*, Bale, 1533; Life of the Admiral, by his son Fernando, Oviedo; *Chronicle of the Indies*, Sevilla, 1535; Manuscript History of Fernando and Isabella, by the curate of Los Palacios; Manuscript History of the Indies, by Las Casas; *Letters and Decades of the Ocean*, by Peter Martyr d'Anghiera, or Angleria; Herrera, *History of the Indies*; Robertson, *History of America*; Churchill, *Voyages*, vol. ii.; Navarrete, *Relacion de los quatro Viajes de Cristobal Colon*; Irving, *Life of Columbus*; Prescott, *Ferdinand and Isabella*.)

COLUMELLA, LUCIUS JUNIUS MODERATUS, the author of one of the most voluminous and valuable works on Roman agriculture, if not himself a native of Gades (Cadiz), sprung from a family belonging to that town, which had been long most intimately connected with Rome. In several parts of his work he speaks of a paternal uncle, Marcus Columella, who had lived in Bætica (Andalusia), and had been well known as an intelligent agriculturist. In particular he speaks of his success in the improvement of the breed of sheep by the introduction of rams from Mauritania, and it has been suggested that the celebrated stock of the Merinos owes its origin to this importation. The author himself possessed an estate in the country of the Ceretani (La Cardaña), near the Pyrenees, where he was eminently successful in the growth of the vine. When he wrote his work he appears to have been residing either at Rome, or in the neighbourhood; but he had a personal knowledge of many parts of the Roman empire. He himself mentions a residence of some length in Cilicia and Syria (ii. 10, 18), but without stating the object which carried him into that part of the world. As he mentions having been present at a conversation on agriculture in which L. Volusius who died A.D. 20 (*Tac. 'Annales,'* iii. 30), took part (i. 7, 3), and as he again speaks of Seneca (whose death occurred in 66) as still living (iii. 3, 31), he must have been born about the beginning of the Christian era.

The work of Columella is addressed to Publius Silvinus, and consists of twelve books: the first two on the choice of a farm and farmhouse, the selection of slaves, the cultivation of arable and pasture land; the next three on the cultivation of the vine, olive, and fruits of the orchard, &c.; the sixth and seventh, on the ox, horse, mule, ass, sheep, goat, and dog, that is, the shepherd's dog and the house dog, for he specially excludes the sporting dog, as interfering with, instead of promoting the economic management of a farm. The eighth book treats of the poultry-yard, and the ninth of bees. The next, which has for its subject the vegetable and flower garden, presents the unusual spectacle of a poem in the middle of a prose work. This form was selected by Columella at the pressing solicitation of his friend Silvinus, and the poem was avowedly put forth as a supplement to the Georgics of Virgil, in answer to the challenge of the Mantuan bard (*Georg. iv.*). In the eleventh book the author is again on the terra firma of prose, and gives us in three long chapters, not very closely connected, the duties of a bailiff, a farmer's almanac, and the vegetable garden. This book is sometimes entitled the 'Bailiff' (*Villicus*); as the last bears the name of the 'Bailiff's Wife' (*Villica*), and treats of the indoor duties, the making wine and vinegar, preserving fruits, &c.

In the composition of this work, Columella has made free use of the Roman writers on agriculture who preceded him. Among these we may particularly mention Cato the Censor, Terentius Varro, his own contemporaries; Cornelius Celsus and Julius Atticus; and lastly,

Julius Græminus, the father of Agricola, who seems to have shown his preference for the name by the name he selected for his son. But the author of whom he speaks in the highest terms, and to whom he most willingly appeals, is Mago the Carthaginian, whose work on agriculture, as he tells us, containing eight-and-twenty books, was translated from the Phœnician into Latin, under a special decree of the Roman senate. The latinity of Columella has nearly all the purity of the Augustan age; but wherever his subject gives him an opportunity, he discovers a taste for that sentimental and declamatory style which distinguishes the writers of the first and second centuries. Columella is often cited by Pliny the Elder in his 'Natural History,' but generally with an expression of dissent. He is also quoted by Vegetius and Palladius. But the treatise on agriculture by Palladius appears to have superseded Columella's work, and to have thrown it altogether into oblivion. Besides the great work of Columella, which we have described, there is a single book entitled 'De Arboribus,' in which reference is made to a preceding book now lost. These two appear to have been a portion of an early edition of the work on agriculture, probably in four books, which being afterwards enlarged, swelled into the twelve we now possess. Accordingly the matter of the 'De Arboribus' will be found with some alterations and many additions, in the third, fourth, and fifth books of the greater work; and Cassiodorus actually speaks of sixteen books written by Columella. In ignorance of this, the writers of many of the manuscripts, as well as the early editors, have inserted the minor treatise after the second book of the more complete work, thus causing many contradictions and great confusion in the numbers of the following books.

The writings of Columella have generally been published together with the works of the other authors 'De Re Rustica.' The chief editions are these: 'The Principia,' Venice, fol., 1472; Bologna, fol., 1494; by Aldus, 8vo, 1513, or rather 1514; by R. Stephens, 8vo, 1548; by Gesner, Leipzig, 2 vols. 4to, 1735; and that which is much the best as well as most complete, the edition by J. G. Schneider, 4 vols. 8vo, 1794-7.

COLVILLE, JOHN, of the family of Colville, of East Wemyss, county of Fife, was some time minister of Kilbride, and chanter of Glasgow, of which latter office the church of Kilbride was the appropriate prebend; but disliking the poverty which, on the Reformation, had become incident to the condition of a Scots clergyman, he abandoned that profession about the year 1578, got introduced to court, and the following year we find him attending the Privy Council as Master of Requests. ('Act Parl.' iii. 150.)

He was soon afterwards engaged in the treasonable conspiracy of the Raid of Ruthven, when he was sent by the party that had seized the king, as ambassador to Queen Elizabeth. On the king recovering his liberty, Colville was seized at the instance of Arran, the king's adviser, and imprisoned in Edinburgh Castle. He was probably restored to royal favour not long after; for on the 2nd of June 1587 he was appointed by the king a lord of session in the room of his uncle, Alexander Colville, commendator of Culross. But on the 21st of the same month he gave up the place again in favour of his uncle, and got some appointment, as it seems, in relation to the supply granted by parliament for the king's marriage expenses. About the same time also he sat in parliament for the burgh of Stirling. Soon afterwards he joined the Earl of Bothwell in his attack upon the king in December, 1591, for which he was again forfeited in parliament. The next year he accompanied Bothwell to Holyrood House in a new attack upon James. But the party being discovered and defeated, Bothwell was obliged to flee; and Colville, by betraying his associates, obtained a pardon. Bothwell afterwards fled to Orkney, and thence to France, whither Colville also proceeded. Colville, in the hope of obtaining permission to return, used various arts to ingratiate himself with the king. In the year 1600 he published at Edinburgh a treatise entitled 'The Palinode,' which he represented as a refutation of a former treatise of his own against James's title to the English crown, which, "in malice, in time of his exile, he had penned;" whereas, in fact, no such treatise was ever penned by him. (Spottisw. 'Hist.' 457.) All his arts to obtain his recall to his native country proving unsuccessful, he at length professed himself a Roman Catholic, and became a keen writer against the Protestant faith. In 1601 he wrote a 'Parænesis ad Ministros Scotos super eua Conversione,' which was translated and printed at Paris the following year. He wrote also 'Capita Controversa,' and 'De Causâ Comitissæ Bothwelli,' who, like himself, had turned Roman Catholic. Charters ('Lives of Scots Writers') mentions another work of his, 'Oratio Funeris Esequiis Elizabethæ destinata,' and the author of the 'History of Sutherland' speaks of a manuscript left by him touching the affairs of Scotland. He died while on a pilgrimage to Rome in the year 1607.

COMBE, DR. ANDREW, was born in Edinburgh, October 27, 1797, the fifteenth child and seventh son of a family, which numbered seventeen in all. His father was a respectable brewer in Edinburgh, and a man of superior mind and integrity; his mother also was a superior person. Educated in his boyhood and youth very much under the care of his elder brother George, the subject of the following notice, he chose the medical profession; and, having studied at Edinburgh and Paris, and taken the degree of M.D., he began practice in Edinburgh in 1823. A pulmonary complaint under which he had laboured since 1819, and which obliged him to make frequent

journeys into warmer climates, precluded him from such an active career as a physician as he might otherwise have been fitted for. In 1836 he was appointed Consulting Physician to the King of the Belgians. As early as 1818 he had, like his brother George, given his attention to phrenology and become a convert to it; and both during his practice as a physician and afterwards, he continued to advocate its doctrines through the 'Phrenological Journal.' He was also a distinguished writer on general scientific and medical subjects. The following is a list of his most important separate works:—'Observations on Mental Derangements,' 12mo, Edinburgh, 1831; 'The Principles of Phylology applied to the preservation of health, and to the improvement of physical and mental Education,' 8vo, Edinburgh, 1834—a work which has been highly appreciated, and has gone through sixteen or seventeen editions; 'The Physiology of Digestion considered with relation to the principles of Dietetics,' Edinburgh, 1836, also a most popular and useful work; 'A Treatise on the Physiological and Moral Management of Infancy,' 8vo, Edinburgh, 1840, eight editions of which have been sold. These works were written by Dr. Combe in the intervals during which he enjoyed comparative freedom from the malady which he knew was to carry him away. The last years of his life were spent by him as a confirmed invalid, either shut up in his room in Edinburgh, or seeking health by continued travelling and sea-voyages. In 1842 he was in Madeira. The mildness of his demeanour during his long illness, and the zeal with which he continued to forward every scheme of benevolence which accorded with his sense of what was right and expedient, obtained him the peculiar regards of all who knew him. His death, long expected, took place on the 9th of August 1847; and an interesting and affectionate account of his 'Life and Correspondence' was published in 1850 by his brother George.

* COMBE, GEORGE, an elder brother of the subject of the preceding notice, was born at Edinburgh, October 21, 1788. Educated for the legal profession, he became in 1812 a writer to the Signet in Edinburgh, and remained in practice for about twenty-five years. Led, about his thirtieth year, to take an interest in phrenology, as expounded by Gall and Spurzheim (with the latter of whom he became personally acquainted in Edinburgh in 1816), he grew to be a firm believer in their speculations; and during the whole of his subsequent life he has devoted himself to the propagation of phrenology as a science, to its improvement by studies and observations of his own, and to the exposition of its possible applications. In 1819 he published his 'Essays on Phrenology, or an Inquiry into the System of Gall and Spurzheim,' subsequently developed into his 'Elements of Phrenology,' and his 'System of Phrenology,' numerous editions of which have been sold. Under his auspices was subsequently (1823) established the 'Edinburgh Phrenological Journal;' and between 1820 and 1830 he engaged in various controversies, both on the platform and through the press, in behalf of his favourite system. One of these controversies was with Jeffrey, in 1826, in connection with a criticism on phrenology which appeared in the 'Edinburgh Review;' another was with Sir William Hamilton. In 1828 Mr. Combe published his principal work entitled 'The Constitution of Man considered in relation to External Objects,' a work partly phrenological, but elucidating also the general doctrine that the intellectual and moral procedure of man, as well as the physical procedure of the universe, is regulated by natural laws, which laws must be studied, as the basis of any rational treatment of human beings, educationally or legislatively. The work provoked many attacks from different points of view, but proved highly popular, and having been enlarged and reprinted in a cheap form it has of late years been largely circulated, both in Britain and America. In 1833 Mr. Combe delivered in various parts of Britain a course of lectures, afterwards published, on 'Popular Education,' besides being translated into French, German, and Swedish. In 1836 he was a candidate for the chair of logic and metaphysics in the University of Edinburgh, on which occasion Sir William Hamilton obtained the appointment.

During the years 1838, 1839, and 1840, Mr. Combe travelled and resided in the United States, and the results of this tour were published at Edinburgh on his return in a work in three volumes, entitled 'Notes on the United States of North America during a phrenological visit.' There had already appeared, as the produce of his pen during this visit, his 'Lectures on Phrenology,' delivered in America in 1839, his 'Lectures on Moral Philosophy,' delivered in 1840, and various other phrenological pamphlets. Between 1838 and 1843 he paid several visits to Germany. Alive, from the nature of his speculations, to all movements of social reform or philanthropy as well as to philosophical questions, Mr. Combe published in 1845 'Notes on the new Reformation in Germany, and on Natural Education and the Common Schools of Massachusetts,' and in 1847 'Thoughts on Capital Punishments,' 'Remarks on Natural Education,' and a tractate on the 'Relation between Religion and Science.' In 1850 he edited the 'Life and Correspondence' of his eminent brother, Dr. Andrew Combe. In 1851 he delivered in Edinburgh and published a 'Lecture on Secular Education;' and about the same time he took much interest in the establishment in Edinburgh of a secular school, in which education should be imparted on the principle of familiarising the pupils with the natural laws, physiological and economical, on which correct and prudent life is to be based. Among Mr. Combe's most recent publica-

tions have been his 'Remarks on the Principles of Criminal Legislation and the Practice of Prison Discipline,' 8vo, London, 1854; and a work entitled 'Phrenology applied to Painting and Sculpture,' 8vo, London and Edinburgh, 1855. He was also author of some letters on the subject of strikes by workmen, which appeared in the 'Scotsman,' an Edinburgh newspaper, and which were afterwards reprinted in 'The Times.' Mr. Combe resides in Edinburgh, which has been the chief scene of his numerous labours, both philanthropic and scientific. He married in 1833 a daughter of the celebrated Mrs. Siddons.

* COMBERMERE, STAPLETON COTTON, FIRST VISCOUNT, is eldest son of the late Sir R. S. Cotton, M.P. for Cheshire, and was born about the year 1770. He entered the army in 1791; and served in Flanders in the campaign of 1793-94. Two years later he embarked for the Cape of Good Hope under Sir Thomas Craig, in command of the 25th Light Dragoons, and, accompanying his regiment to India, went through the campaign of 1798-99 against Tippoo Sultan, and was present at the siege of Seringapatam. In 1808 he accompanied Lord Wellington to the Peninsula in command of a cavalry brigade; here he particularly signalled himself during the campaign in the north of Portugal and in the operations at Oporto, and afterwards at the battle of Talavera. In the following year he was promoted to the local rank of lieutenant-general, and in 1810 was appointed to the command of the allied forces under the Duke of Wellington. In this position he remained till the close of the war in 1814, distinguishing himself at the head of his cavalry upon every occasion, and being frequently mentioned in the despatches. He covered the retreat from Almeida to Torres Vedras, and took part in the battles of Busaco, Fuentes d'Onor, and Salamanca, where he was severely wounded; and also in those of the Pyrenees, Orthes, and Toulouse. In 1817 he was appointed governor of Barbadoes and commander of the forces in the West Indies, which he exchanged in 1822 for the chief command of the British forces in India, and was at the head of the troops at the siege and capture of Bhurtpore in 1825-26. A peerage had been granted to him for his Peninsular services, and he was now raised to a viscountcy for his Indian exploits. On the death of the Duke of Wellington he was appointed Constable of the Tower of London and lord-lieutenant of the Tower Hamlets; and in 1855 was advanced to the rank of Field-Marshal in the army. His lordship is a G.C.B.; he also holds an appointment in the court as Gold Stick in Waiting to her Majesty.

COMENIUS, JOHN AMOS, was born in 1592, at Comna, in Moravia, from which place he assumed the name of Comenius. His parents were of the sect of Moravian brethren. After studying at Herborn, near Nassau, he returned to Moravia, and became pastor at Fulneck; but that town being burnt during the religious war then raging, he lost his property, including books and manuscripts, and took refuge at Lesna, in Poland, where he became rector of a Moravian school. He there published, in 1631, his 'Janua Linguarum,' in Bohemian and Latin. This work established his reputation as a philologist, and was translated into most European and some of the Oriental languages. An edition in Latin, English, and French, was published in London, 1639: 'The gate of Tongues unlocked and opened, or else a Seminary or Seed-plot of all Tongues and Sciences.' It is a sort of encyclopaedic phrase-book, in 100 chapters, every chapter being devoted to a separate department of natural history, the arts, or the various professions, sciences, and trades, &c., introducing most of the words belonging to each, and giving by means of the context an explanation of the same. His 'Orbis sensualium pictus, hoc est, omnium fundamentalium in mundo rerum et in vita actionum pictura et nomenclatura,' Latin and German. Nurnberg, 1659, is a vocabulary of technical words, likewise arranged in chapters, but not in connected sentences, each chapter being illustrated by a woodcut representing the objects therein mentioned. These two works resemble each other in principle, but differ in the arrangement. The 'Orbis' also has been often reprinted, and translated into various languages. A Latin and English edition appeared in London, 1777. Comenius was sought after by several governments for the purpose of reforming the system of public instruction. He came to England in 1638, and afterwards went to Sweden in 1642, where he was introduced to the Chancellor Oxenstiern; but he soon after left Sweden and retired to Elbing, where he attended chiefly to the publication of his works. In 1648 he returned to Poland. On the invitation of Prince Ragotzky, he went to Transylvania, where he established a school which he afterwards transferred to Patak, near Tokay. After directing the school for four years, he returned to Lesna in 1654, but was driven away by the ravages of the religious war which continued in Poland. Lesna was burnt by the Catholics, and Comenius again lost his books and manuscripts. He at last settled at Amsterdam, where he found a protector in Laurence de Geer, who defrayed the expense of the publication of his 'Opera didactica,' fol., 1657, in which Comenius collected several of his works already published separately. The principal of these are: 1st. 'Novissima linguarum methodus,' a sort of universal grammar, with references to the German, Greek, Hebrew, Hungarian, and Turkish languages; 2nd. 'Janus Linguarum novissima Clavis'; 3rd. 'Lexicon januale, seu Sylva Latinae Linguae'; 4th. 'Schola Ludus,' which consists of dramatic pieces composed for his pupils at Patak and Lesna, and in which men of various classes and conditions are introduced, each speaking about his own profession or

trade, and using the technical words belonging to it. He wrote numerous other works, some historical: 'Historia Ecclesiae Sclavonica,' Amsterdam, 1660; 'Historia Persecutionum Ecclesiae Bohemicae,' called also 'Martyrologium Bohemicum,' Berlin, 1763; 'Some Controversies against the Socinians'; 'Antiquitates Moraviae,' which is still unedited; a Map of Moravia, with names in German and Bohemian, Amsterdam, 1627; 'Prodromus Pansophiae,' London, 1639, a sort of prospectus of a universal cyclopædia, which was the dream of his life. In his old age he appears to have adopted the views of some religious visionaries, and to have believed in their revelations. He died at Amsterdam, November 1671.

COMINES, PHILIPPE DE, Lord of Argenton, was born at the château of Comines, near Menin in Flanders, about 1445. His father was in the service of Philip the Good, duke of Burgundy, who was also sovereign of Flanders, and Philip himself was early introduced into the court of Charles le Téméraire, Philip's son, whose councillor and favourite he became for a time. When Charles made Louis XI. prisoner at Péronne in 1468, Comines exerted all his influence to calm his master's violent temper; he acted the part of a conciliator between the two princes, and succeeded in bringing about a treaty of peace between them. This timely service was not forgotten by Louis. In 1472 Comines all at once left the service of the Duke of Burgundy, and passed into that of Louis XI., who received him most graciously, and made him his chamberlain and sénéchal of Poitou. The reasons for this step on the part of Comines have remained a secret; probably he was tired of Charles's violent temper, and foresaw his impending ruin. Comines married Helène, of the family of the counts of Monsoreau in Anjou, who brought him as her marriage portion the fiefs of Argenton, Coppoux, Brissou, and others. Comines was employed by Louis XI. in several diplomatic missions to Savoy and other places. After the death of Louis, Comines having joined the party of the Duke of Orleans (afterwards Louis XII.), who aspired to be regent during the minority of Charles VIII., was arrested in 1486 on a charge of treason, and shut up for several months in an iron cage at Loches, when he was transferred to Paris. He was at last tried and condemned to banishment, and his property was confiscated, but the sentence was not executed, and the fame of his abilities induced Charles VIII. to employ him in several important negotiations. He accompanied Charles in his Italian campaign, of which he gives a good account in his memoirs. Previous to the return of the king through North Italy, in the midst of the hostile armies of the Italian princes, Comines was sent to Venice to endeavour to detach that state from the league, but he did not succeed. The battle of Fornovo (July, 1495) secured the retreat of the French across the Alps. After his return from Italy, Comines retired to his estates, where he began to write his memoirs. When Louis XII. succeeded to the crown in 1498, Comines repaired to court to pay homage to the new sovereign, for whom he had at one time suffered severe imprisonment and risked his life; but Louis does not seem to have noticed him by any marks of favour. Comines returned into the country, and he died at Argenton in Poitou, October 1509, at the age of 64. His body was transferred to Paris, and buried in the church Des Grands Augustins, where Comines had built himself a chapel. His monument has been transferred to the Musée des Monuments Français. He left one daughter, who married a count of Penthievre.

The memoirs of Comines contain the history of his own times from the year 1464 to the death of Charles VIII. in 1498. He gives a faithful picture of that singular character Louis XI., whom he greatly extols for his political art. He is also a great admirer of the Venetian government. He was a cool and sagacious observer, and seems to have fully understood the crooked policy of those times. The great value of Comines's 'Memoirs' consists in his frankness and sincerity. He is a matter-of-fact historian; like his contemporary Machiavelli, he paints men and politics such as he found them to be, with all their selfishness, craft, and evil doings, which he relates with great imperturbability. Those historians are the mirror of their age, and what that age was may be conceived by reflecting that Louis XI., Ferdinand of Aragon, the Borgias, Ludovico il Moro, and others of the same stamp, were the contemporaries of Comines. The 'Memoirs' of Comines have been often reprinted, and translated into various languages. The edition by Godefroy and Lenglet du Fresnoy, London, 1747, consists of 4 vols. 4to, of which however the first volume only is occupied by the 'Memoirs,' the other three being filled with numerous historical documents and additions.

COMMANDINE, FREDERIC, born in 1509, at Urbino, of a good family, was at first in the service of Clement VII., after whose death he studied medicine at Padua. Unsatisfied with the state of this science, he applied himself to mathematics, and finally settled at Verona as the instructor of the Duke of Urbino and his son. He died there in September 1575.

This is all that is generally stated as known of Commandine, except the evidence which his writings afford that he is to be placed at the head of all the commentators on the mathematics of the Greeks, whether as respects the care which he took to select and print valuable remains (several of which would probably have been lost but for him), or the knowledge which he displayed in the treatment of difficult and corrupt texts. The list of works which we have collected is as follows. The dates stand at the beginning, and separate the titles:—

1558, Venice: the *Præmities* and *Statistical Treatise* of Archimedes, in Latin, with notes (from a bad text). 1558, Venice: Ptolemy's *Planisphere*, with commentary, in Latin; in the same book is Jordanus, also with a commentary. 1562, Rome: the *Analemma* of Ptolemy, with commentary. The original is lost, but a mutilated Latin version was found by Commandine. With this came his own work on *Horology*, printed at Venice. 1565, Bologna; and Pesaro, 1572: Archimedes on *Floating Bodies*, with commentary, Latin. 1566, Bologna (and several other editions): Latin version of the four books (then known) of Apollonius, with the lemmas of Pappus, the commentary of Eutocius, and the book of Serenus on the Section of Cones and Cylinders. 1570, Pesaro: the book of Mohammed of Bagdad, on *Division of Surfaces*, which John Dee, who found it, attributed to Euclid, and gave to Commandine. A translation into English, with Commandine's preface, is appended to the second edition of Dee's *Euclid*, 1660. 1572, Pesaro: *Euclid* in Latin, fifteen books with scholia, in folio. An Italian version of the books most commonly read, under Commandine's inspection, appeared at Urbino in 1575. 1572, Pesaro: Latin edition of *Aristarchus*, with notes. [ARISTARCHUS] 1575, Urbino; and Amsterdam, 1680: the *Pneumatics* of Hero, with Latin version and notes. 1588, Pesaro; again in 1602; and Venice, 1589; lastly, at Bologna, 1660, edited by Manolesius: the mathematical collections of Pappus, books 3-8 inclusive, being all which remain, folio. It is sometimes stated that the edition of Pappus appeared in 1558, which is not correct, as Commandine died before the publication, which was superintended by his son-in-law Valerio Spaccioli, as explained in the preface.

COMMELIN, JEROME, born at Douai in France in the 16th century, embraced the reformed religion and retired to Geneva, where he carried on the business of a printer. His abilities both as a printer and a scholar, which in that age were often united in the same person, attracted the attention of Frederic, Elector Palatine, who invited Commelin to Heidelberg, and made him his librarian. At Heidelberg he published editions of several Greek and Latin authors, which were valued for their correctness; among others of Eupapius, the text of which he corrected by the manuscripts in the palatine library of Heliopolis, Apollodorus, &c., to which he added critical notes. He also published a handsome edition of 'Rerum Britannicarum Scriptores Veteriores ac Principi,' folio, under the fictitious date of Lyon, 1587, dedicated to Frederic, Elector Palatine. This collection consists of Geoffrey of Monmouth, Pontius Virunnius, Gildas, Bede, Guilielmus Neobrigensis, Froissart, and Buchanan's 'De Jure Regni apud Scotos.' Commelin died in 1598. He has been praised for his accuracy and learning by Scaliger, Casaubon, and De Thou.

Another of the same name, and probably of the same family, was a printer at Leyden in the 17th century, and published a valuable edition of Virgil, with Servius's Commentaries and numerous notes, 4to, Leyden, 1646.

COMMELINUS, ISAAC, born at Amsterdam in 1598, wrote several historical works in the Dutch language; among others—'Hollandsch Placaat Boek, or Collection of the Acts of the Government of Holland,' 2 vols. fol., Amsterdam, 1644; also a 'History of the Dutch East India Company,' 4to, 1646; the 'Lives of the Stadthouders William I. and Maurice of Nassau,' fol. 1651; and the 'Life of Frederic Henry of Nassau,' which was translated into French; 'Histoire de la Vie et Actes Mémoires de Frédéric Henri de Nassau, Prince d'Orange,' fol., Amsterdam, 1656, which is an interesting historical work. He also collected the materials for a description of Amsterdam, which was published by his son, Caspar Commelyn, 1693, 2 vols. fol., 'Beschryvinge van Amsterdam, tot den jaare 1691,' fol., 1691, with plates; a second and enlarged edition of which appeared in 1726. It is considered a very good account of that important city. He died in 1676.

JAMES COMMELYN, his brother, collected many curious and scarce historical documents concerning Holland, and wrote in French, 'L'Histoire des Troubles, Divisions, et deplorables Calamités des Guerres Civiles survenues dans les 17 Provinces depuis le Commencement du Règne de Philippe II. jusqu'à la Mort de Guillaume, Prince d'Orange,' which remains unedited, as well as his 'Actes et Privilèges des Villes de Delft et Leyden, et de leurs banlieues,' 3 vols. fol.

JOHN COMMELYN, son of Isaac, and a senator of Amsterdam (born 1629, died 1692), published several works on descriptive botany. One of the most important of his writings, which however did not appear till after his death, in 1697, was a work in folio, with very fine plates, of the new plants then growing in the Medical Garden of that city.

CASPAR COMMELYN (born 1667, died 1751), the nephew of John, gave to the world a second volume in 1702, after which he became the author of two volumes in quarto upon similar subjects. At that time the Dutch held in their hands the commerce of the east, and the Commelins were among the first who made known in Europe the curious plants of the Cape of Good Hope.

COMMODUS, LUCIUS ÆLIUS AURELIUS, son of Marcus Aurelius and of his wife Faustina, was born A.D. 161. At the age of sixteen he accompanied his father in his journey to Syria, which had been disturbed by the revolt of Avidius Cassius. On his return to Rome, Commodus obtained his first consulship. He next accompanied his father in his last expedition against the Quadi and the Marcomanni, during which Aurelius died at Vindebona (Vienna), and Commodus became his successor A.D. 180. Having made peace with

the northern tribes he returned to Rome, where he enjoyed a triumph. For a short time he appears to have governed with moderation, while several experienced officers—Albinus, Pescennius Niger, Severus, Pertinax, and others—made the name of Rome respected on the frontiers of the empire. Commodus however, having dismissed the counsellors and friends of his father, gave himself up to the society of freedmen, gladiators, and prodigal women, with whom he spent his time in debauchery. His elder sister Lucilla conspiring against him with Pompeianus, Quadratus, and other senators, they were all seized and executed. Having put to death his own wife Crispina, Commodus took for his concubine Marcia, a mistress of Quadratus, who seems to have maintained some sort of influence over him till his death. But a succession of unworthy favourites engrossed all political power, and committed every kind of injustice and cruelty. Conspiracy after conspiracy was discovered or invented by them, and a number of the principal senators were put to death and their property confiscated. The favourites themselves destroyed each other in succession. One of them, Perennis, was put to death with all his family, and was replaced by Cleander, a Phrygian freedman, who put up to sale all the honours and offices of the empire as well as the lives of the citizens. Meantime the legions in Britain mutinied, and Commodus sent Pertinax, who had been exiled by Perennis, to appease the mutiny. In Gaul also a soldier called Maternus collected a numerous band of deserters, but Pescennius Niger being sent against him, Maternus found means to escape with several of his followers, and came secretly to Rome with the intention of killing the emperor, but he was discovered and put to death. A dreadful pestilence afflicted Rome about the same time, which lasted three years, according to Dion. Commodus, to avoid the contagion, retired for a time to Laurentum, where he continued his usual dissolute mode of life. At last a revolt broke out at Rome against the favourite Cleander; the people repulsed the Prætorian cavalry sent against them, and Commodus, to appease the storm, ordered the favourite to be put to death. In the year 191, under the consulate of Apronianus and Bradius, the Temple of Peace, one of the most splendid buildings of Rome, took fire, and vast treasures, as well as collections of books, which were deposited in it, were consumed. The fire spread to the temple of Vesta, from whence the Vestals ran away to the imperial palace, carrying the Palladium with them. The flames extended to the imperial palace also, and consumed part of it. In the following year Commodus was consul, for the seventh time, with Pertinax, whom he had recalled to Rome. Having had repeated information of Severus aspiring to the empire, Commodus wrote to Albinus in Britain offering him the title of Cæsar, which was refused. [CLAUDIUS ALBINUS.] At the close of his career, Commodus set no bounds to his extravagances: he disregarded common decency, exhibited himself in the circus and in the amphitheatre with the gladiators, dressed himself as Hercules, whose name he assumed, and on one occasion danced naked before the spectators. (Herodian, i. 15.) Being dissuaded by Marcia and some of his officers from degrading himself in public in the company of gladiators, it is said that he wrote down their names for execution, and that the scroll being found by Marcia led to a plot against his life. However this may be, poison was administered to him, and while suffering under its effects, a powerful athlete was sent in, who strangled him (A.D. 192), in his thirty-second year and the thirteenth of his reign. Pertinax, who succeeded him, had his body buried privately, but it was afterwards transferred to the Mausoleum of Hadrian. (Dion, lib. 12, Lampridius, and Herodianus, i. 6-16.)

Commodus had the advantage of a good education and the example of a virtuous father; he found the empire prosperous after a succession of wise reigns for nearly a century, with a number of able officers, civil and military. He left it a prey to confusion, sedition, ill-repressed irruptions of barbarians, the army demoralised, and rival generals disputing for the supreme power. The visible and rapid decline of the Roman empire may be said to date from his reign. The plea of insanity, which is put forth for Caligula's short career of frenzy, cannot be extended to Commodus: his was decidedly a vicious and depraved disposition, which had a full opportunity of displaying itself in the possession of unlimited power.

Coin of Commodus.
British Museum. Actual size. Bronze. Weight 583 grains.

COMNE'NI FAMILY. [ALEXIS COMNENUS.]
*COMTE, AUGUSTE, a French philosopher, whose peculiar system

of views has been put forth by himself, and is now generally referred to under the name of "The Positive Philosophy," was born within a year or two of the close of the last century. His family was strongly Catholic and royalist. Educated at one of the French lycées, he gave very early proofs not only of a speculative turn of mind, but also of a dissatisfaction with the existing methods of knowledge and the existing forms of society, and a belief that he was destined to play the part of a Bacon in the 19th century, and initiate a new philosophical revolution. Mathematics and the physical sciences occupied much of his attention, but he had already extended his views to social questions, and become possessed with the doctrine that the time had come when all science and all philosophy must be treated from the social, as the supreme point of view. It was with views and aims of this kind fermenting in his mind that, while yet a mere youth, he was involved within the powerful vortex of the Saint-Simonian school, which, immediately after the restoration of 1815, began to figure in Paris. The genius of Saint-Simon, then between his fiftieth and sixtieth year, drew around him, as by a kind of magnetic fascination, a number of ardent young men, whom he indoctrinated with his views, and almost all of whom—notwithstanding that few of them in mature years have adhered to the philosophy of their master—have been distinguished in one way or another in the subsequent history of France. Of these Comte was the youngest—the Benjamin, as he was called, of the Saint-Simonian school. Saint-Simon had high hopes of him; and when, about 1820, the school put forth, as one of their propagandist works, an exposition of the scientific basis of their system, it was on Comte that the preparation of the work was devolved. The work entitled 'Système de Politique Positive' however only partially satisfied Saint-Simon, who said that while "it expounded the generalities of his system from the Aristotelian point of view," it overlooked "their religious and sentimental aspect." The truth is, Saint-Simon and Comte were beginning to part company. The discrepancy did not become decided till after the death of Saint-Simon in 1825, when Comte broke off from the little band of Saint-Simonians—including Enfantin, Bazard, Rodrigues, and Augustin Thierry—who remained faithful to the views of their master, and set about forming an organisation for their farther propagation. Comte has subsequently spoken disparagingly of Saint-Simon, and represented his temporary connection with that enthusiast as rather an interruption to his own intellectual development than a furtherance of it; but certainly there are such coincidences between M. Comte's subsequent works and the cardinal speculations promulgated by Saint-Simon when alive, that, unless we can suppose that the pupil prompted the master to a greater extent than usually happens in such cases, it is impossible to acquit M. Comte of a certain appearance of ingratitude in his allusions to this part of his education. In 1826, M. Comte was seized with what he calls "a cerebral crisis," which for the time was believed to be irrecoverable insanity. He did recover however, and lived to propound the philosophy with which his name is associated. Supporting himself by teaching mathematics—in which capacity he was professor at the École Polytechnique, till differences with his colleagues and the accession of Louis Napoleon to the empire, deprived him of his office, and reduced him to a state of indigence in which his chief support has been voluntary contributions from his admirers in France and England—he has within the last six and twenty years published a series of works, all devoted to the elucidation of his "Positive Philosophy," and in which even those who have no sympathy with that system in its fundamental doctrines and its spirit, or even abhor it, recognise great power of intellect, and an extraordinary fertility of generalisation on all subjects.

First, published at intervals in six large volumes, between 1830 and 1842, came his greatest work, entitled 'Cours de Philosophie Positive.' In this work, after propounding his main doctrine, which is, that the human mind has, by a natural law, passed through three successive stages in its thoughts upon all subjects; namely, the *theological* stage, in which phenomena are accounted for by the supposition of the agency of supernatural beings to produce them; the *metaphysical* stage, in which, while living supernatural beings are got rid of, certain abstract ideas, such as those involved in the words "Nature," "Harmony," and the like, take their place in men's thoughts as the productive causes of everything; and the *positive* stage, in which, shaking off both unseen spiritual agencies and abstractions, the mind grasps the notion of the universe in all its departments as proceeding according to certain laws or uniform sequences, to be ascertained by observation and induction;—he proceeds to apply this view to the entire system of human knowledge. All that man knows, or can know, he says, consists of certain sciences which may be arranged in a hierarchical order as follows, according to the increasing speciality and complexity of the facts with which they respectively deal:—1st. *Mathematics*, the most general and simple of all, which deals with the mere facts of number and magnitude; 2nd. *Astronomy*, which pre-supposes mathematics, but takes in as additional the facts of the celestial sphere, i. e. suns, planets, moons, comets, &c., as they are seen as mutually acting masses; 3rd. *General Physics*, which takes for granted mathematical and astronomical laws, but concerns itself also with the motions and other mechanical phenomena of bodies on our earth; 4th. *Chemistry*, which, in like manner, pre-supposes all the foregoing, but investigates farther the phenomena of the molecular changes and constitution of

bodies; 5th. *Biology* (subdivided into Vegetable and Animal, and involving Psychology as a department of Animal Biology concerned more immediately with the phenomena of nerve and brain-function), undertaking the farther study of individual organised beings; and 6thly. *Sociology* or the *Social Science*, investigating, as the most complex phenomena of all, those of social or corporate life. Hitherto, according to M. Comte, only the first four of these sciences have been even partially emancipated from the theological and metaphysical spirit, and pursued positively; but the time has come, he thinks, for the extension of the true positive or scientific spirit to all, and consequently for the expulsion of theology and metaphysics from the universe. As the apostle of this great speculative change he first reviews the various sciences up to the last and chief one which, by a gross but convenient grammatical hybridism, he calls Sociology, giving in fact a series of treatises in which the generalities of mathematics, astronomy, general physics, chemistry, and biology, are lucidly expounded, and then reserves his strength, in the last three volumes, for Sociology. Here he reviews the history of the world, and protesting against the anarchy of all existing politics, attempts to lay down the basis of a true or positive politics, such as states will ultimately be governed by, when the positive millennium shall have come. Apart from the main purpose, this portion of the work abounds with striking thoughts and propositions of wide application.

In 1843 M. Comte published a small mathematical work entitled 'Traité Élémentaire de Géométrie Analytique à deux et à trois dimensions,' followed not long afterwards by a popular treatise on astronomy, which has been highly admired; and in 1844 he published a 'Discours sur l'Esprit positif,' enforcing popularly the ideas of his larger work. Within the next few years, however, a second vital 'crisis' of his life—not this time of the 'cerebral' kind, but of the sentimental—worked a certain change in his views. A virtuous affection, to which he makes frequent allusion in subsequent autobiographic passages in his prefaces, for a lady named Clotilde, whose death left him miserable, revealed to him, what Saint-Simon had long before hinted, the deficiency and meagreness of his philosophy on the sentimental and religious side. To make up this deficiency has been the object of all his later activity. This he has attempted to do, however, not by obliterating any part of his already-proclaimed philosophy, not by calling back either cashiered theology or cashiered metaphysics into the universe, but by supplementing *positivisme* with the necessary effusion from the heart. In fact, within the last eight years, M. Comte has been trying to found a new religion, consistent with the fundamental doctrine of *positivisme*; to accomplish which, seeing that *positivisme* denies deity or invisible spirits of any kind apart from humanity, he makes humanity itself the object of the new worship. In 1848 he published a 'Discours sur l'Ensemble du Positivisme,' in which the notion of the new religion, as the necessary appendix to his philosophy, was promulgated, and in 1849 he published a singular book of a more precise nature, entitled 'Culte Systematique de l'Humanité: Calendrier positiviste, ou Système général de Commemoration publique,' in which work he proposed a systematic worship by humanity of itself, as represented in its greatest men of all ages—twelve of whom he specified as worthy to preside over the twelve months of the year, while for each week he nominated subordinate men, and for each day minor celebrities still (it was singular to the reader to note how many Frenchmen there were among these gods and goddesses); and also arranged some of the formalities of the worship. In 1852 appeared the 'Catéchisme Positiviste, ou sommaire exposition de la Religion Universelle en onze Entretiens Systematiques entre une femme et un prêtre de l'Humanité,' M. Comte himself having in the meantime given practical effect to his views by assuming the office and title of the chief priest of his own religion, preaching as such, and performing the marriage ceremony and funeral rites when called upon by his disciples to do so. His disciples in this sense however have never been numerous; and while publishing his last work, entitled 'Système de Politique Positive, ou traité de Sociologie, instituant la Religion de l'Humanité,' the first volume of which appeared in 1851 and the others have been issued since, he has not only been in poor circumstances, but has been complaining of the desertion of his pupils one after another, and expressing his sorrow that he sees no one all over the earth whom, before he dies, he can ordain as his successor in the chair of the new philosophy and the pontificate of the new religion.

Those who desire farther information respecting the life and views of this very extraordinary personage, will find it either in his own works above enumerated, or in two works published in this country presenting an abstract of his views—'Comte's Philosophy of the Sciences,' being an Exposition of the Cours de Philosophie Positive,' by G. H. Lewes; and Miss Harriet Martineau's 'Positive Philosophy of Auguste Comte freely translated and condensed' (2 vols. 1853.) Comte's 'Philosophy of Mathematics' extracted from his main work, has been translated in America by W. M. Gillespie; and his 'Popular Astronomy' also, if we mistake not, has found an English translator.

CONCA, SEBASTIANO CAVALIERE, a celebrated Italian oil and fresco painter, was born at Gaeta, in the kingdom of Naples, in 1676. He was for sixteen years the pupil of Solimena at Naples, but being convinced of the superiority of the Roman school, he and his brother Giovanni determined to settle in 1706 at Rome. Conca now laid aside

the brush, and for five years exerted himself assiduously and exclusively with the portraiture, copying the best ancient and modern works in Rome, with a view to improving his style of design, in which however he was not very successful. Conde was one of the imitators of Pietro da Cortona, and possessed to a great degree the facilities of that master: he was ready, rapid, and superficial. His works are numerous in Rome and in the Roman States. One at Siena is considered his masterpiece, the 'Probatica, or the Sacred Pool of Siloam,' in the hospital of Santa Maria della Scala. Several of Conde's works have been engraved by Frey and others, and he etched a few plates himself. Sebastiano Conde died at Naples in 1764. Giovanni Conca acted chiefly as his brother's assistant.

CONDE, JOSÉ ANTONIO, one of the few Spanish orientalists who have attained a European reputation, was born at Paraleja, a small town of the province of Cuenca, about 1765. He was educated at the university of Alcalá, where he studied not only Greek, which in the days of Martí was sufficiently rare in Spain, but Hebrew and Arabic, the latter a language which ought to have peculiar attractions for Spanish scholars, but which had fallen into such neglect in the Peninsula that Casiri, a Syrian, had been engaged to catalogue the Arabic manuscripts in the Realcurial. He was intended for the law, but having obtained in early life an appointment at the royal library of Madrid, devoted himself entirely to literature. His first separate publication appears to have been a translation of the Greek minor poets, Anacreon, Theocritus, Bion, and Moschus, in 1796, which was followed in 1799 by a rendering into Spanish of the Nubian geographer Al Edrisi's 'Description of Spain,' accompanied by the original Arabic, a very dry performance, in which the translation is not free from inaccuracies. It appears however to have acquired for Conde a high reputation, and when he soon after began collecting materials for a history of the Moors in Spain, he obtained the king's permission to have an Arabic manuscript bearing on his purpose transcribed for him at the public expense from the royal library of Paris. He was at the same time a member of the Spanish Academy, a member and librarian of the Academy of History, and one of a commission of three, consisting of Cienfuegos, Navarrete, and himself, to superintend a continuation of Sanchez's famous collection of early Castilian poetry. The French invasion, which had so blighting an influence on the career of almost every man in Spain, was peculiarly fatal to Conde, for he had the culpable weakness to become an 'Afrancesado,' or partisan of the invaders. He was appointed by Joseph Bonaparte to the office of chief librarian of the Madrid library, which he retained as long as the French held possession of the capital, and when they were driven from the Peninsula he followed. He passed some years at Paris in arranging the materials he had collected for his history, and was finally permitted to return to Madrid. Gayangos assigns his return to 1819, but Ticknor, the American historian of Spanish literature, who visited Spain in 1818, mentions that "among the men of letters" whom he earliest knew at Madrid, "was Conde, a retired, gentle, modest scholar," who, "in the honest poverty to which he had been reduced," not unwillingly consented "to assist him in his Spanish studies, and in the collection of his library." "Every possible obstacle," says Gayangos, "was thrown in his way by the members of the government, and these marks of indifference to his pursuits and animosity towards his person on the part of his countrymen, and the extreme poverty to which he was reduced by the refusal of government to grant him any portion of the emoluments of his former office, seriously affected the health of Conde, who died in 1820, just as his friends were about to print his work by subscription." The first volume only was printed with the advantage of the author's superintendence, the remaining two of the history were put together from his manuscripts. Conde's library was sold after his death in London, and much has been said of late years respecting one of the volumes, the 'Cancionero de Baena.' This unique manuscript, a collection of ancient Castilian poetry, formed by a Jew named Baena, was one of the most highly valued treasures of the Realcurial library, and is described as such in Rodriguez de Castro's 'Biblioteca Española.' At the time that Conde was one of the commission to continue the collection of Sanchez, this volume with others of value was authorized to be delivered to them for the purpose of editing; when the French invasion broke up the project in 1808, it was still in Conde's hands, and after his death in 1820 it was sold in London by his heirs, purchased by Richard Heber, and at Heber's sale again purchased by a French bookseller, who sold it to the royal library at Paris, whose property it still remains. It was lent from Paris to the Spanish government, for the purposes of an edition which was published at Madrid by Ochoa in 1851, and it is from the preface to that edition that these facts are taken. They furnish a striking argument in favour of the views of those who maintain the inexpediency of lending valuable books from public libraries.

The reputation of Conde now rests entirely on his 'History of the Dominion of the Arabs in Spain,' of which translations have been published in several languages, and one in English by Mrs. Jonathan Foster, issued in 1854, occupies three volumes of Bohn's 'Standard Library.' Previous to the appearance of this work the only writer on the subject who supplied information from Arabic sources was Casiri, whose materials were made use of by Madden in his elaborate 'Historia de España,' and by the Rev. T. H. Horne in his sketch of the career of

the Mohammedans inserted in Murphy's 'Arabian Antiquities of Spain.' Conde in his preface is very severe on Casiri, whom he censures for a "confusion respecting persons, places, and times, which can only be rectified by those who read the originals which Casiri has imperfectly rendered." Precisely the same accusation has been brought against Conde himself by Gayangos and Dozy, and too conclusively proved to be for a moment doubted. Yet even after the appearance of Gayangos's valuable translation from the Arabic of Al-Makharri's 'History of the Mohammedan Dynasties of Spain' (London, 1840-43, 2 vols. 4to), with its still more valuable notes, the work of Conde is one to which the student may often recur with profit, especially now that he is put on his guard against its mistakes and shortcomings. With a great deficiency of critical power, Conde cannot be looked on as an historian, but he is a useful chronicler; and it should never be forgotten that he carried light into a portion of history where little indeed had been done before him.

CONDÉ, LOUIS II. DE BOURBON, PRINCE DE, born at Paris in 1621, was the son of Henri de Bourbon, and grandson of Henri I. of the same name, who with his cousin Henri de Navarre (afterwards Henri IV.), figured in the civil and religious wars of France under the reigns of Charles IX. and Henri III. [HENRI IV.] The House of Condé was a branch of the house of Bourbon. The town of Condé, in Hainaut, from which it took its title, came to the house of Bourbon in 1487 by the marriage of Francis of Bourbon, count of Vendôme, with Mary of Luxembourg, heiress of St. Paul, Soissons, Enghien, and Condé. Charles de Bourbon, the son of Francis, had many children; the eldest, Antoine, became king of Navarre by marrying Jeanne d'Albret, by whom he had Henri IV.: Louis de Bourbon, another son of Charles, and the first who assumed the title of prince of Condé, was killed at the battle of Jarnac, 1569. [COLIGNY.] He had married Eléonore de Roye, dame de Conty or Conti, by whom he had Henri I. of Bourbon, prince of Condé above mentioned, and François, who took the title of prince of Conti.

Louis II., prince of Condé, the subject of the present article, has been styled 'the Great' on account of his military abilities and great success. At the age of twenty-two he won the battle of Rocroi in Flanders, 1643, against a superior Spanish force. He afterwards fought against the troops of the emperor, and gained the battles of Fribourg and Nordlingen. In 1647 he was sent into Catalonia. In the following year he returned into Flanders and defeated the imperial army commanded by the Archduke Leopold, brother to the emperor Ferdinand III., at Lens in the Artois. Meantime, the civil war of the Fronde broke out at Paris; Condé was courted by both parties, and he served both in succession. He was the means of bringing back young Louis XIV., the queen mother, and Cardinal Mazarin, into Paris in August 1649. Condé however put a high value on his services; he was haughty and warm-tempered, and the cardinal was jealous and suspicious. The result was, that after several court intrigues, and plots and counterplots, Condé was arrested by order of the queen and the cardinal, and kept in prison for about a year, when the parliament of Paris obtained his deliverance. Being appointed governor of Guienne, he treated with Spain, and soon after raised the standard of revolt, ostensibly against the cardinal, who continued to exercise the whole political power of the state in spite of the general dissatisfaction. Condé marched upon Paris, engaged Turenne in the Faubourg St. Antoine, and entered Paris, where he had the parliament in his favour. The cardinal having at last consented to quit the court, the king published an amnesty, and re-entered Paris, 1652; but the Prince of Condé retired to Flanders, where he served for several years in the Spanish armies. He fought, in 1654, at Arras against Turenne, who obliged him to retire, but the retreat was effected with great skill. In 1656 Condé, with Don Juan of Austria, defeated the Marshal de la Ferté, and obliged Turenne to retire from before Valenciennes. In 1658 Condé was defeated by Turenne near Dunkerque, which town was taken by Louis XIV., and given up to the English, according to an agreement with Cromwell. By the peace of the Bidasoa, 1659, Condé was reinstated in all his honours with a full amnesty. In 1668 he served under Louis XIV. in the conquest of Franche Comté. In 1672, Louis having declared war against Holland, Condé commanded one of the corps d'armée which invaded that country; he took Wesel, and was wounded at the passage of the Rhine. In 1674 he gained the bloody battle of Senef, in Flanders, against the Prince of Orange (William III. of England), and relieved Oudenarde. In 1675, after Turenne was killed near Salsbach, Condé took the command of his army, and obliged Marshal Montecuccoli, who commanded the imperial troops, to retire. This was Condé's last campaign. Being tormented by the gout, he left the service and retired to his estate of Chantilly, where he spent his latter years in the society of men of letters. Racine, Boileau, Bossuet, and Boudaloue were often his guests. He died at Fontainebleau in 1686. His personal character has been variously represented. Bossuet is too panegyric. The memoirs of Count Jean de Coligny, who knew him intimately, and which were published in 1799, are too unfavourable and probably exaggerated. ('Œuvres de Lemontey,' tome v.) Like most of the men high in office at the court of Louis XIV., their master included, Condé seems to have had but imperfect notions of moral principle. Desormaux has written the 'Life of Condé,' 4 vols. 12mo. The narrative of his campaigns is interesting in a military point of view.

The line of Condé became extinct in 1830 by the death of the Duke of Bourbon, son of the last prince of Condé, who, in the wars of the revolution, commanded a corps of French emigrants on the Rhine. The Duke of Bourbon never assumed the title of prince of Condé. His only son, the young Duke d'Enghien, was put to death by Bonaparte in 1804. The Duke of Bourbon himself died at Chantilly soon after the revolution of July, 1830, in a manner which was much commented upon in the newspapers of the time.

CONDER, JOSIAH, was born in London on the 17th of September, 1789. He was the son of a bookseller, and very early displayed a taste for literature. His first attempts were given to the world in the 'Athenæum,' a monthly magazine then edited by Dr. Aikin; and in 1810, in connection with a few friends, a volume of poems was published under the title of 'The Associate Minstrel.' In 1814, being at the time a publisher and bookseller in St. Paul's Churchyard, he purchased the 'Eclectic Review,' of which he continued to be editor until 1837, though he retired from the bookselling business in 1819. Under his management the 'Eclectic Review' received the assistance of many eminent men among the non-conformists, such as Robert Hall, John Foster, Dr. Chalmers, Dr. Vaughan, and others. During this period his industry was displayed by the production of other works also. In 1818 appeared two volumes 'On Protestant Nonconformity.' In 1824 'The Modern Traveller' was commenced: it extended to thirty-three volumes, nearly the whole of which were compiled by Mr. Conder, and all under his superintendence. In 1824 also appeared 'The Star in the East,' a poem; and in 1834 a 'Dictionary of Geography,' and a new translation of the 'Epistle to the Hebrews, with Notes.' In 1836 he edited 'The Congregational Hymn-Book,' issued under the sanction of the Congregational Union; and in 1837 he published 'The Choir and Oratory: Sacred Poems,' to which Mrs. Conder was a contributor. He was the author of many other works, but we have mentioned the principal.

Mr. Conder's reputation having become established among the Dissenters, he was requested in 1832 to undertake the editorship of 'The Patriot,' a newspaper recently established in the dissenting interest. From this time he took a more active part in the public proceedings of the Dissenters, attending their meetings, and affording them the assistance of his counsels. 'The Patriot,' under Mr. Conder's management, became the organ of what may be termed in politics the Whig section of the Dissenters, as opposed to the Radical section; while in ecclesiastical affairs it represented the Congregationalists and Baptists. For twenty-three years Mr. Conder fulfilled the duties of his office with exemplary care, industry, and liberality; producing also occasionally works of importance, such as 'An Analytical and Comparative View of all Religions,' 'The Harmony of History with Prophecy,' &c., and several pamphlets on stirring topics of the day.

Mr. Conder married in 1815 Joan Elizabeth, the daughter of Mr. Thomas of Southgate, by whom he left four sons and a daughter. After a short illness, he died on December 27, 1855.

CONDILLAC, ETIENNE BONNOT DE, was born at Grenoble in 1715, and was distinguished at an early age for his taste for metaphysical inquiries. The works of Locke chiefly attracted his attention, and were the cause of his publishing, in 1746, his 'Essai sur l'origine des connoissances humaines,' a work intended to promulgate principles founded on those of the English philosopher. The tendency which Locke's works had naturally produced of tracing all knowledge back to sensations, induced him to publish, in 1749, his second work, the 'Traité des Systèmes,' which was designed to oppose the theories of Leibnitz, Spinoza, and others, as based upon abstract principles, rather than what he conceived the more solid foundation of experience. His third work, 'Traité des Sensations,' is his master-piece. The author supposes a statue, which he has the power of endowing with one sense at a time. He first gives it smell alone, and then traces what may be the pleasures, pains, abstract ideas, desires, &c., of a being so limited with regard to its faculties; the other senses are then added, and the statue gradually becomes a complete human being. His works seem to have made but little impression on the general public in his time, but he was much sought after by those of high attainments. Diderot, J. J. Rousseau, and Duclos were among the number of his most intimate friends, and his celebrity spread so far, that he was appointed preceptor to the Prince of Parma. In this capacity he published his 'Cours d'études,' divided into 'L'Art d'écrire, l'art de raisonner, l'art de penser, and Histoire générale des hommes et des empires,' a series of works calculated to promote his own philosophical views. Having completed the education of his pupil, he retired to philosophical meditations. In the year 1768 he was admitted a member of the academy in the room of Abbé l'Olivet, though, strange to relate, he never afterwards attended the meetings of this learned body. His labours only terminated with his life, as he published his 'Logique' but a few months previous to his death, which happened August 3, 1780. His 'Langue des Calculs,' a posthumous work, did not appear till the year 1798.

As a philosopher, Condillac rather deserves the term ingenious than profound. He has the art of developing his own views in the most entertaining manner possible; in working out his theories he almost becomes prolix. Not satisfied with giving his statue smell alone, examining its situation in that state, and then adding the other senses, he considers it endowed with each of the other senses alone,

and thus extends his 'Traité des Sensations,' which is at best-but a pleasing example, to a thick volume.

Professor Stewart has justly censured the French for taking for granted that Condillac was a correct interpreter of Locke, and at the same time is somewhat severe on their Locke mania. It is clear enough that Condillac was not a faithful interpreter of Locke. He had, perhaps wilfully, overlooked a very short chapter in the 'Essay on the Human Understanding'—'Of simple Ideas of Reflection.' Locke traced all our knowledge to sensation and reflection; Condillac stopped at sensation alone, and thus produced a system which cannot be surpassed in sensualism. When his statue has smell alone, he tells us, that if a rose be presented to it, it is certainly, with respect to us, a statue smelling a rose; but is, with respect to itself, nothing but the smell of the flower; the very perceiving subject is to itself nothing but an odour. And this was supposed to be a faithful exposition of the doctrines of Locke—of Locke, who allows the mind ideas of reflection, "when it turns its view inward upon itself, and observes its own actions about those ideas it has;" and therefore can never have conceived that a perceiving being cannot divide itself in thought from the thing perceived. Some have thought that Condillac imbibed this notion of a sensation being to the mind only a modification of itself from Berkeley; but though Berkeley denied an inanimate substratum to our sensations, he certainly never went so far as to make the mind take itself for a self-perceiving sensation.

Condillac's opinion of the importance of words is much more akin to Berkeley's views. Without words he contends we should have had no abstract ideas (in the Locke language); that we can only think of a particular image, and our thinking of any general idea, as *man*, is an absurdity; that having observed something in common to several individuals, as *Peter, John, &c.*, we agree to call them all by the term *man*, and that the general idea is nothing but an idea of such term, or an acknowledgment that the term may fit each of the individuals equally well. Something very like this may be found in Berkeley's Introduction to his 'Treatise concerning the principles of Human Knowledge.'

The knowledge of our own and of other bodies, according to Condillac, commences with the sensation of touch. He gives his statue that sensation, and making it strike itself with its hand, states that while this hand as it were, says, on the consciousness of a sensation, 'C'est moi' (It is I), the part touched echoes the declaration: thus the statue concludes that both parts belong to its individual self, in other words, that it has a corporeal body. On the other hand, if the statue touch an extraneous body, though the hand says 'C'est moi,' it perceives there is no echoing sensation, and therefore concludes there is another body besides its own.

Condillac has been much lauded for his ingenious views of the progress of language. He begins with the language of action, and in the absence of abstract ideas among some American tribes, who have scarcely any language but that of cries and gestures, he finds a support for his hypothesis that these ideas depend on words. The language of action, he says, preceded that of words, and this latter language still preserved much of the character of its predecessor. Thus the elevation and depression of the voice succeeded the various movements of the body. Variation of accent was so much the more necessary as the rude people, who were beginning to lay aside their language of gesture, found it easier to express their meaning by changing emphasis than inventing words. This emphatic style of speaking is in itself a sort of prosody, which insensibly leads to music, and the accompanying of these sounds by gestures leads to dancing, all of which the Greeks called by the common name *μουσική*, music. He then proceeds to trace the drama, rhetoric, and even the peculiarity of the Greek language by regular steps, the language of action having formed the basis of all.

On the whole, the philosophy of Condillac is a system of ultra-sensualism; by omitting reflection (in Locke's sense of the term, that is, Condillac himself employs the word *reflection*, but signifies by it nothing more than the looking back on past impressions), he makes the mind perceive nothing but sensations, itself being to itself nothing but a combination of sensations, and thus turn which way we will, there is no escape from the world of sense.

The fullest account of Condillac's philosophy for those who do not wish to peruse his voluminous works, will be found in La Harpe's 'Cours de la Littérature': a short account of the influence of Locke on France through his medium is given in Professor Stewart's 'Philosophical Essays'; but those who wish to hear Condillac himself without much trouble, will find his system most fully and pleasingly developed in the 'Traité des Sensations.'

CONDORCET, MARIE-JEAN-ANTOINE-NICOLAS CARITAT, MARQUIS DE, was born in Picardy in 1743. His family owed their name and title to the castle of Condorcet, near Nion, in Dauphiny. His uncle, the bishop of Lisieux, who died in 1783, superintended his education, and was the means of procuring for him the most powerful patronage as soon as he was old enough to be introduced into public life. He first distinguished himself as a mathematician, and his success in this department soon opened to him the door of the Academy of Sciences.

It is on his application of philosophy to subjects connected with the happiness of mankind and the amelioration of social institutions

that his fame chiefly rests. The friend of D'Alembert and of his illustrious contemporaries, Condorcet was one of the warmest and most distinguished of Voltaire's disciples. He cannot, it is true, be placed in the first rank, either as a deep thinker or original writer; nevertheless his meditative and lofty mind, his unabated zeal in the pursuit of truth, his generous ardour, which never cooled or shrunk from the difficulties which it had to encounter, his perseverance in applying himself to all sorts of useful pursuits, and the multiplicity of his labours, have all contributed to assign him a conspicuous place among those who have exercised an influence over the destinies of his country.

His philosophical views have been widely circulated, and the practical effect of them is still visible. The main doctrine which he sought to inculcate, and which is contained in his '*Esquisses des Progrès de l'Esprit humain*,' was the perfectibility of man, considered both in his individual and social capacity. According to him, the human frame and intellect, by the aid of time and education, would infallibly attain to perfection. This was the creed which he proposed to substitute in the place of the sanctions of morality and religion. This singular notion, with which he was so deeply imbued, has given to his philosophy a peculiar and special character, which distinguishes it alike from the sceptical fatalism of Voltaire and the gloomy dogmatism of Diderot. In the philanthropic mind of Condorcet philosophical speculations were blended with the deepest sympathy for his fellow-men, and the most unwearied activity in promoting all such reforms as he thought useful. Of his magnanimity and elevation of soul he gave ample proof in the heroic conduct which he pursued in the hour of difficulty and danger. Proscribed by the Convention as a 'Girondin,' he voluntarily quitted the house of his friend Madame Verney, which had afforded him an asylum during eight months of the first revolution, rather than expose her to the consequences of a decree which might have made it a capital crime to harbour or conceal an outlawed deputy. Homeless, and wandering about the country round Paris, he endeavoured to conceal himself in the numerous quarries with which its neighbourhood abounds. At last the pressure of hunger drove him into a small inn in the village of Clumart, where he incontinently betrayed himself by exhibiting a pocket-book obviously too elegant for one in so destitute a condition. He was arrested, and though exhausted by want and fatigue, and with a sore foot occasioned by excessive walking, he was conveyed to Bourg-la-Reine, and thrown into a dungeon. On the morrow (28th of March 1794), he was found dead in his cell, having put a period to his existence by swallowing poison, which he always carried about him in order to avoid the ignominy of the scaffold.
